AND FULL EXPLANATIONS GIVEN OF THE
VARIOUS DETACHED PARTS OF KNOWLEDGE,
WHETHER RELATING TO
Natural and Artificial Objects, or to Matters Ecclestastical, Civil, Military, Commercial, Éc.
Including Elucidations of the moff important Topics relative to Religion, Morals, Manners, and the Oeconomy of Life:

тосет Cl в with
A Description of all the Countries, Citics, principal Mountains, Scas, Rivers, Ec. throughout the World;
A General History, Ancient and Modern, of the different Empires, Kingdoms, and States; AND
An Account of the Lives of the moft Eminent Perfons in every Nation, from the carlieft ages down to the prefent times.

Compiled from the writings of the beft Authors, in feveral languages; the moft approved Dictionaries, as well nf general frience as of its particular branches; the Tranfactions, Journals, and Memoirs, of various Lcarned Societies, the MIS. Lectures of Emirent Profeflors on different [ciences; and a variety of Original Materials, furnifhed by an Extenfive Correfpoudence.
THE FIRST AMERICAN EDITION, IN EIGITEEN VOLUMES, GREATLI IMPROVED.
ILLUSTRATED WITH FIVE HUNDRED AND FORTY.TWO COPPERPLATES.

# H NCYCLOP ADIA. 

## R A N

RANA, the frog, in zoology ; a gennus belonging to the order of amplibia reptilia. The body is naked, furnifhed with four fcet, and withnut any tail. There are 17 fpecies. The moft remarkable are,

1. The temporaria, or common frog. This is an animal fo well known, that it needs no defcription ; but fome of its properties are very fingular.

Its fpring, or power of taking large leaps, is remarkably great, and it is the beft fivimmer of all fourfooted animals. Nature hath finely adapted its parts for thofe ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnilhed with very Arong mufcles.

While in a tadpole fate, it is entirely a water animal ; the work of generation is performed in that element, as may be feen in every pond during fpring, when the female remains oppreffed by the male for a number of days.

The work of propagation is extremely fingular, it being certain that the frog has not a penis intrans. There appears a frong analogy in this cale between a certain clafs of the vegetable kingdomand thofe animals; for it is well known, that when the female frog depofits its fpawn, the male infantaneoully impregnates it with what we may call a farina focundans, in the fame naznner as the palm-tree conveys fructification to the flowers of the female, which would otherwife be barren.

As foon as the frogs are relcafed from their tadpole flate, they immediately take to land; and if the weather has been hot, and there fall any refrefhing fhowers, you may fee the ground for a confiderable face perfeetly blackened by myriads of thefe animalcules, feeking for fome fecure lurking places. Some philefophers, not giving themfelves time to examine into this phenomenon, imagined them to have been generated in the clouds, and thowered on the earth; but had they, like Derham, but traced them to the next pool, they would have found a better folution of the difficulty. See Preternatural Rains.

As frogs adhere clofely to the backs of their own fiecies, fo we know they will do the fame by fifh. Walton mentions a Arange fory of thair dcftroying pike; but that they will injure, if not entirely bill carp, is a fact indifputable, from the following relation. Not many ycars ago, on filhing a pond belonging to Mr Pitt of Encomb, Dorfethire, great numbers of the carp were found each with a frog mounted on it, the lind legs clinging to the back, and the fore legs fixed in the corner of each cye of the finh, which were thin and greatly wafted, teized by carrying fo difagrecVol. XVI.

RAN
able a load. Thefe frogs Mr Pennant fuppofes to have been males difappointed of a mate.

The croaking of frogs is well known; and from that in fenny countries they are diftinguifined by ludicrons tities: thus they are Ayled in England Dutch nighbitiogales, and Bofton suaites.

Yet there is a time of the year when they become mute, neither croaking nor opening their mouths for a whole month : this happens in the hot feafon, and that is in many places known to the country people by the name of the paddock moon. It is faid, that during that period their inouths are fo cloled, that no force (without killing the animal) will be capable of opening them.
Thefe, as well as other reptiles, feed but a fmall fpace of the year. The food of this genus is flies, innfeas, and fnails. Tcads are faid to teed alfo on becs, and to do great injury to thofe ufeful infects.

During winter, frogs and toads remain in a torpid flate : the laft of which will dig into the carth, and cover themfelves with almof the lame agility as the

2. The cfculenta, or edible frog, differs from the former, in having a high protuberance in the middle of the back, forming a very fharp angle. Its colours are alfo more vivid, and its marks more difinat ; the ground colour being a pale or yellowifh green, marked with rows of black ipots from the head to the rump.This, and (Mr Pennant chinks) the former, are eaten. He has feen in the markets at Paris whole hampers full, which the venders were preparing for the table, by Kinning and cutting off the fore-parts, the loins and legs only being kept; but his ftrong diflike to thefe reptiles prevented a clole examination into the fpec:cs.
3. In the ftate of Pennfylvania, and fome other parts of North America, there is a very large fpecies of frogs called the bull-fros, or rana osellai.a. Their irides are of a dufky red, furrounded with a yellow ring. Thes auricles are covered with a thin circular tkin, which forms a fpot behind each eyc. They have four tocs on the fore-feet, and five palmated tocs behind. Their colour is a durky lorown, mixed with yellowifh green, and fpotted with black. The belly is yellowinl, and faindly fpotted. Thefe male a monfrous roaring noife like a bull, only fomewhat more hoarfe. Their fize is fuperior to that of any other of the genus, and they can fprin!r forward three yards at a leap. By this means they wifl equal in fpeed a very good horfe in its fwifteft courfe. Their places of abode are pond, or bogs with flagna:at water; but they never frequent Alreams. When mans

Ifan!.
of tha na ace twether, they make fuch a honid noife, that two poople commet malerthand c.ich ether's lipeech. Guey crost all tygther, amd then thop for a litte and big in atid a. It fioms as if they had a coptain among the:n : Ine whan he begins to croak, all the others follu'v; d'ld when le flops, they allo beenme filent. When this carsin sives the fignal for fiopping, you loear a 11 : $\because$ Ohe $f$ oconing from him. In the diy-time they Whem niohe any aren noife, unlefs the thy is covered; but in the night-time they may be heard at the diftance ri a nil. atme an hall. When they croak, they are co:amusty near the furface of the water, under the 1 ublec, and have their heads cut of the water. liy goin: $10 w l$, thercfore, one may get up almoft quite clofe (1) tha betore they go :wily. As foon as they are quite ander water, they think themfelves fale, thourh it be ever io thallow. Il:efe creatures kill and cat young ducklings and golinere, and fometimes carry off clickens bhat coare tou hear the water ; when beaten, they cry (ut almont like little chaldecn. As foon as the air begins to grow a litile cool in atum, they hide themfelves under the mud in the botom of fagnant waters, and lie there torpid during the winter. As foon as the weather grows mild towards fummer, they begrin to get rut of their heles and croak. They are fuppofed by the penpic of Virginia to be the purifiers of waters, and are refpected as the genii of the fountains. Some of lacm were taken to England alive feveral years ago.
f. To bato, or toad, is the molt deformed and hicicous of all animals. 'The body is broad ; the baek flat, and covered with a dimply durky hide; the belly large, fivageing, and fwelling out; the legs fhort, and its pace laboured and crawling; its retreat gloomy and filthy: in thort, its seneral appearance is fuch as to Hrite ene with difguft and horror. Yet it it faid by thore who have refolution to view it with attention, that its eyes are fine; to this it feems that Shakefpeare alludes, when he makes his Juliet remark,

Somie fay the lark and loathal toad change eycs.
As if they would have been better beftowed on fo charming a fongler than on this raucous reptile.

But the hideous appearance of the toad is tich as to make this one advantageous feature overlooked, and to have rendered it in all ages an object of horror, and the origin of moft tremendous inventions. ABlian shakes its venrm fo potent, that bafilik-line it conveycid death by its very look and bieath ; but Juvenal is content with making the Roman ladies who were weary if their lupbatads form a potion from its entrails, in erder to pet rid of the rood man. This opinion begat - haers of a more ursidful nature; for in after-times lupe: Rition grave it preternatur.al powers, and made it a pronciral ingredine in tie incantations of nodurnal f.irs.

This animal was believed by fome old writers to lave a ftrie in is heod fiaught with great virtues medical and margical: it was ditinguithed by the name ut die reptile, and called the toat-llone, bufonites, crapautive, droitenfein; but all its fancied powers vanith. \$5ce $\wedge$ are ed mathe difcovery of its bing nothing but the follil. shicas. tocth of the feawoht, or of fome other flat-wothed
fitin, not nofiequent in Britain ts well as feveral other countrics.

Dut thefe fables have been long exploded. And as to the notion of its being a poifonous animal, it is probable that its excellive deformity, joined to the faculty it hats of emitting a juice from its pimples, and at dulk ${ }^{\circ}$ ligu'd from its hind parts, is the loundation of the report.

That it has any noxious qualities there feem to have been no proofs in the imallet degree fatisfactory, tho we have heard many ftrange relations on that point.On the contrary, there have been many who have taten them in their naked hands, and held them long without receiving the leat injury: it is alfo well known that quacks have caten them, and have befides fqueczed their juices into a glass and drank them with impunity. We may fity allo, that thefe reptiles ate at common food to many animals; to buzzards, owls, Norfolk plovers, ducks, and fnahes, who would not touch them were they in any cegree noxious.

So far from having venomous qualities, they have of late been confidered as if they lad beneficent ones; particularly in the cure of the moll terrible of difeafes, the eancer, by fuction: (See Britif, Zoology vol. iii. Append. p. 389 , et feq.) But, from all circumftances, as Mr Pennant obferves they feem only to have rendered a horrible complaint more loathfome.

The mon full information concerning the nature and qualities of this animal is contained in the follow. ing letters from Mr Arfoott and Mr Pitifield to Dr Milles. "It would give me great pleafure (fays Mr Arfcott) to be able to inform you of any particulars worthy Mr Pennant's notice, concerning the load who lived fo many years with us, and was fo great a favourite. The greateft curiofity in it was its becoming fo remarkably tame. It had frequented fome fteps before the hall-door fome years before myacquaintance commenced with it, and had been admired by my father for its fize (which was of the largeft I ever met with), who confantly paid it a vifit every evening. I knew it myfelf above 30 years ; and by con?tantly feeding it, brought it to befo tame, that is always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with iniects of all forts; it was fondeft of fleth maggots, which I kept in bran; it would follow them, and, when within a proper diftance, would fix its eye, and remain moticalcis for near a quarter of a minute, as if preparing for the froke, which was an infantancous throwing its tongue at a great diftance upon the infeet, which tluck to the tip by a glutinous matter: the motion is quicker then the cye can follow $(\Lambda)$.
"I always imagined that the root of its tongue was placed in the forepatt of its under jaw, and the tip towards its throat, by which the motion mult be a half circle ; by which, when its tongue recovered its fituration, the infee at the tip would be brought to the place of deglutition. I was confirmed in this by never obferving any internal motion in its mouth, excepting one fwallow the indant its tongue returned. Poflibly 1 might be miftaken; fir 1 never difiected one, but contented
(1) This rapid capture of its prey might give occafion to the report of its fafcinating powers, Linntus fays, Jofertu in fauces finfuina rerocal.
" Yon may imagine, that a toad, generally derefed, (although one of the mott inoffenfive of all animals), to much taken notice of and befriended, excited the curionty of all comers to the houfe, who all defired to fee it fed; fo that even ladies fo far conquered the horrors inftilled into them by nuries, as to defire to fee it. This produced innumerable and improbable reports, m.king it as large as the crown of a hat, \&cc. \&c."

The following are anfwers from the fame gentleman to fome queries propofed by Mr Pennant.
"Firfl, I cannot fay how long my father had been acquainted with the toad before I knew it ; but when I firft was acquainted with it, he ufed to mention it as the old toad I've known io many years; I can anfiver for $3^{6}$ years.
"Secondly, No toads that I ever fatw appeared in the winter feafon. The old toad made its appearance as foon as the warm weather came, and I always concluded it retired to fome dry bank to repofe till the fpring. When we new-lay'd the fteps, I had two holes made in every third ltep, with a hollow of more than a yard long for it, in which I imagine it ीlept, as it came from thence at its firf appearance.

Third!', It was feldom provoked : neither that toad, nor the multitudes I have feen tormented with great crnelty, ever fhowed the leaft defire of revenge, by fpitting or emitting any juice from their pimples.Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as I have often feen it do the fame upon the feps when quite quiet, was certainly its urine, and no more than a natural evacuation.

Fourthly, A toad has no particular enmity for the fpider; he ufed to eat five or fix with his millepedes (which I take to be its chief food) that I generally provided for it before I found out that flef maggots, by their continual motion, was the moft tempting bait;
but, when offered, it eat blowing flies and humble tees that came from the rat-tailed magyet in guters, or in thort any infert that moved. I imagine, if a bee was to be put before a toad, it would certainly eat is to its coft; but as bees are feldom fli:ring at the fame time that toads are, they can feldom ceme in their way, its they feldom :lppear after fun-rifing or befure lun-it. In the heat of the day they will come to the menti ot their hole, I believe, for air. I cnee from my patlour window obferved a large toad I had in the bank of a bowling green, about 12 at noon, a very hot day, very bufy and active upon the grafs; fo uncommon an ap)pearance made me go out to fee what it was, when I found an innumerable fwarm of winged ants had dropped round his hole, which temptation was as ir:efillible as a turtle would be to a luxurious alderman.
"Fifithy, Whether our toad ever propagated its fpecies, I know not; rather think not, as it always appeared well, and not lelfened in bulk, which it mult have done, I thould think, if it lad difcharged fo large a quantity of spawn as toads generally do. The females that are to propagate in the fpring, I imagine, intt:ad of retiring to dry holes, go into the botom of punds, and lie torpid among the weeds: for to my great tu:prife, in the middle of the winter, having ior amufement put a long pole intu my pond, and twilled it till it had gathered :i large volume of weed, on taking is off I found many toads; and having cut fome afunde: with my knife, by accident, to get off the weed, found them full of fpawn not thoroughly formed. I am not pofitive, but think there were a few males in March ; 1 know there are 30 males ( $B$ ) to one female, 12 or 14 of whom I have feen elinging round a female: I hav: often difengaged her, and put her to a folitary male, to fee with what eagernef's he would feize her. They impregnate the fawn as it is drawn (c) out in long Atrings, like a necklace, many gards long, not in a
large quantity of jelly, like frogs fpawn.

A 2
Sixth!:
$\qquad$
(в) Mr John Hunter has affured me, that during his refidence at Belleifle, he diffeited fome hundreds of toad, yet never met with a fingle female among them.
(c) I was incredulous as to the obfetrical ofices of the male toad; but fince the end is fo well accounted for, and the fact eftablifhed by fuch good authority, belief muft take place.

Mr Demours, in the Memoirs of the French Academy, as tranilated By Dr Templeman, vol. i. p. 37t, has heen wery particular in refpect to the male toad as acting the part of an aiconcheur: His account is curious, and claims a place here.
"In the evening of one of the long days in fummer, Mr Demours, being in the king's garden, perceived two to uls couple. togeiber at the edge of an hole, which was formed in part by a great tone at the tol.
"Curiofity drew him to fee what was the occafion of the notions he obferved, when two fatts equally new furprifed him. Thefirflwas the extreme difficulty the female had in laying her eges, iatonuch that the dit not ieem capable of being delivered of them without fome affitance. The freond was, that the male was mounted on the back of the female, and exerted all his ftength with his hinder feet in pulling out the eg.3s, whilil his fore feet embraced her breat.
"In order to apprehend the manner of his working in the delivery of the female, the reader muft obferve, that the paws of thefe animals, as well thofe of the forefeet as of the hinder, are dividel into fiveral to:s, which c.ar perform the office of fingers.
"It mult be remarked likewife, that the eggs of this fpecies of toads are included each in a mimbranous cont that is very firm, in which is containet the embryo ; and that thefe eggs, which are oblong and about twu lines in length, leeing fuftened one to another by a thart but very frong cord, form a kind of chaplet, the be:ds is which are ditint from each other about the half of their length. It is by drawing this cord with his paw thet the male performs the function of a midwife, and acquits limfelf in it with a dexterity that one would nut expert from follumpifh an :mimal.
"The prefence of the obferver did not a little difcompofe the male: for fome time he fopped fiert, and theen

- S.u fó, Infens beisig 11 eir food, 1 never liw ang tow dhow any liaing or dillake to any flat (o).
"Jerent! li, I hatdl) tenmember any perfons takine it up cacejt my hather and myfelt; 1 do not know whother it lad any puticular atiachmen to ws.
" Rejhbly, In iclfat to is em, I anfiect this laft rucry: Had it not been lor a tame ranen, 1 make no doubt but it would have been now living ; who one day lecing it at the mouls of its lonle, pabled it out, and alh.one'h 1 refcued it, pulled out one eye, and hust it fin, t. At notwiththanding its living a twelvemonth it recer c.igryed itielf, and had a diffoculy of thing its food, matiog the mark for want of its eye : before that accidwii it had all the appearance of perfect healih."

6. The rubeta, or natter-jack, frequents dry and fana.) flaces: it is found on Pltuey common, and allo new Reveby abbey, Lincolnthire. It nover leaps, secila.cr dees it crawl with the flow pace of a tuad, but is motion is like to ruming. Scveral are fonnd commonIy togeth.or, and like others of the genus they appea.: in the escnings. "lree upper part of the body is of a dirty yellow, clouded wih brown, and covered with porons pimples of unequal lizes : on the back is a yellow line. The upper fide of the tody is of a paler hue, matred with black fpots, which are rather rough. On the fore-feet are four divided tces; on the hind five, a little webbed. The length of the body is wo inches and a cquarter; the breadth, one and a quarter: the "ength of the fore-less, one inch one-lixth; of the hind legs, two inches. We are indebted to Sir Jufeph Banks, for this account.

F Tlse pipal, or Surinam toad, is more ugly than wen the cummon one. The body is flat and broad; the head fmall; the jaws, like thofe of a mole, are extended, and evidently formed lor rooting in the ground: the $l$ kin of the neck forms a fort of wrinkled collar: the colour of the head is of a dark chefrut, and the ejes are Imall : the back, which is very broad, is of a lightilh grey, and feems covered over with a number of fimall eyes, which are round, and placed at nearly equal ditances. Thefe eyes are very different from what they feem: they are the animal's eggs, covered with tleir 1hell, and placed there for hatching. Thele eggs are l,urred deep in the 0kir, and in the beginning of incubasiun but juit appear; and are very vilible when the young animal is about to burft from its confinement. "lley are of a reddith, fhining yellow colour ; and the frascs between them are full of fmall warts, refembling 1-ctic.

I'nes is their fituation previous to their enming forth; IUt ruthing fo much demands our admiration as the
manner of their production. The case, when formad in the orary, are fent, by fome internal canals, whici annatomifts have not hitherto defcribed, to lic and come to maturity mader the bony fubfance of the back: in this flate they are impregnated by the male, whofe feed finds its way by pores very lingularly contrived, and pierces not only the flin but the peliolleum: the lkin, however, is fill apparently entire, and furms a very thick covering over the whole brood; but as they adivance 10 maturity, at difterent intervals, one after another, the egg fecms to llart forward, and burgeons from the back, becomes more yellow, and at laft breaks; when the young one puts forth its head: it 1fill, how: ever, keeps its lituation until it has acquired a pioper degree of Arengel, ind then it leaves the fhell, but llill continues to keep upon the back of the parent. In this manner the prpal is feen travelling with her wonderous family on her back, in all the different farges of maturity. Some of the ftrange progeny, not yet come to fulficient perfection, appear quite torpicl, and as jet without life in the egg: others feem juth beginning to rife througlt the 1 kin; here peeping forth from the thell, and there having entirely forfaken their prifon: fome are forting at large upon the parent's back, and others defcending to the ground to try their own fortune below. The male pipal is every way larger than the female, and has the fkin lefs tightly drawn round the bod). The whole body is covered with puftules, relembling pearls; and the belly, which is of a bright yellow, feems as if it were fewed up from the thrnat to the vent, a feam being feen to run in that direstion. This animal, like the reft of the frog kind, is mont probably harnlefs.
8. The water frog of Cateßy has large black eyes, yellow irides, and long limbs: the upper part of the head and body is of a duky green, fpotted with black; and from each eye to the nofe is a white line ; and alfo a yellow line along the fides to the rump. They frequent rivulets and ditches, which they do not quit for the dry land. It is faid they will fpring five or fix gards at a leap.
9. The rana arborea, or green tree frog of Catefby, is of a flender thape and bright green colour, matked on each fide with a line of yellow: the eyes are black; the irides ycllow; they have four toes before and five behind; at the end of each toe there is a round membrane, concave beneath, and not unlike the mouth of a leech. They lurk under the lower fides of leaves, cyen of the tallef tiees, and adhere firmly, by means of the membranes at the ends of their toes, thicking to the fmoothet furface : a looking-glafs was held bctore one,

## $\mathrm{R} \wedge \mathrm{N}$

at four yards diftance ; it reached it at one leap, and fuck clofely to it. At night thefe frogs make an inceffant chirping, and leap from fpray to topray in fearch of infects. This fpecies is common to America and the warmer parts of Europe.
10. The land frog of Cateby has much the appearance of a toad: above it is grey or brown, Spotted widh duliky; below white, faintly ipotted; the irides are red; and the legs thort. They frequent the high-lands, and ate feen moft frequently in wet weather and in the hotteft tinse of the day: they leap, feed on inferts, particularly the fire-fly and an:. Sometimes the Americans bake and reduce this fpecies to powder, which, mixed with orrice root, is taken as a cure for a tympany.
11. The cinereous frog has a gibbous, cineleous, and finooth back; the belly is yellow and granulated : on cach fide, from the nofe to the rump, there is a white line ; and there is the fame on the outfide of the thighs and legs; the toes are bullated at their ends. They inhabit Carolina.

RANAI, one of the Sindwich iflands difoovered by Captain Cooke, is about nine miles diftant from Mowee and Mororon, and is fituated to the fouth-weft of the paffage between thofe two illes. The country towards the fouth is elevated and craggy; bat the other parts of the illand had a better appearance, and feemed to be well inhabited. It abounds in roct:, fuch as fweet potatoes, taro, and yams; but produces very few plaintains and bread-fruit trees. The fouth point of Ramai is in the latitude of $20^{\circ} 46^{\prime}$ north, and in the longitude of $203^{\circ} 8^{\prime}$ ealt.

RANCID, denotes a fatty fubflance that has become rank or mufly, or that has contracted an ill emcll by being kept clofe.

RANDIA, in hotany: A genus of the monogynia order, belonging to the pentandia clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is monophyllous; the corolla falver-fhaped; the berry unilocular, with a capfular rind. There are two lpecies, viz. the nitis and aculeata.

RANDOLPH (Thomas), an eminent Englifh poet in the 17 th century, was born in Northamptonlliire 1605. He was educated at Wefminfter and Cambridge, and very early diftinguithed for his excellent genius; for at about nine or ten years of age he wrote the Hiftory of the Incarnation of our Saviour in verfe. His fublequent writings eftablifled his character, and gained him the efteem and friendfliip of fome of the greatelt men of that age, particularly of Ben Joinfon, who adopted him one of his fons in the mules. He died in 1́s.34, and was honourably interred. He wrote, 1. The Mufes Look-
ing-glefs, a comedy. 2. Amyrtas, or thic Inyomitle Dowy, a paloral, afed before t.:c king and gheet. 3. Ariftippus, or the Jovinl Dhidufophe: t. The Con- ccited Pedlar. 5. The Jealous Lovers, a comedy. C. Iicy for Honefty, down with linavery, a comedy; and teveral poems.

RANDOM shot, in gunnery, is a flat made when the muzzi= of a gun is raifed above the horizontal liue, and is not detigned to theet direatly or point blank.

The utmolt rondom of any piece is about ten timres as far as the bullet will go point-bla.k. The bullet will go farthelt when the piece is mounted to :tb-ut $45^{\circ}$ above the level ranige. Ste Guxiery and I'aojectiles.

RANGE, in gurnery, the path of a bullet, or the line it deferibes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the horizon, it is called the right or lead range: if it be mounted to $45^{\circ}$, $i t$ is find to tave the utmofl range; all others between 00 and $45^{\circ}$ are calie 1 the intermedia:e rangrs.

RANGER, a fiworn officer of a foreft, appointe. 1 by the king's letters patent; whofe bufinefs is to walk through his charge, to drive back the deer out of the purleus, sc. and to prefent all trefpaffes within his jurididtion at the next furefl-court.

RANK, the order or place affigned a perfon fuitable to his quality or merit.

Rank, is'a ftraiglte line made by the foldiers of a battalion or fquituron, drawn up fide by fide: this order was eftablithed for the marches, and for regulating the different bodies of trocps and officers which compofe an army.

RANK and Prccencince, in the Britifl arniy and navy, are as follow:

Engincers RANK. Chief, as colonel; direfor, as lieutenant-colonel; fub-director, as majar; engincer in ordimary, as captain; engineer extraordinary, as captain lientenant; fub-engineer, as lieutenant; practition-er-engineer, as enfign.

Nazy Rasx. Admiral, or commarder in chief of the Britifh fleet, has the rank of a field-marfhal; admirals, with their flags on the main-top-malt-head, r:mk with generals of horfe and frot; vice-idmirals, with lieutenant-generals; rear-admirals, as major-gcuerals; commodores, with broad pendauts, as brigadier-generals ; captains of pof-1lipi, after three years from the date of their firft commilfion, as colonels; other captains, as commanding pôt-hips, a slieutenant-colonels; captains, not taking pof, as maj, rs; lieutenatsts, as captains.

prepare beds four feet wide and two deep : however, in default of fuch compoft, ufe beds of any good light earth of your garden; or, if neceffary, it may be made light and rich with a portion of drift-fand and rotten dung, cow-dung is moft conmonly recommended; but they will alfo thrive in beds of well-wrought kitchengarden carth, and they often profper well in the common flower-borders.

The feaion for planting the roots is both in autumn and fering; the autumn plantings generally flower ftrongeft and foonelt by a month at leaft, and are fucceeded by the fpring-planting in May and June. Perform the autumnal planting in October and early part of November, but fome plant towards the latter end of September in order to have a very early bloom; but thofe planted in that month and beginning of October often come up with rank leaves foon after, in winter, fo as to require protection in hard frofts; thofe, however, planted about the middle or latter end of October, and beginning of November, rarcly thoot up frong till towards fpring, and will not require fo much care of covering during winter ; and the fpring-planting may be performed the end of January or beginning of February, or as foon as the weather is fettled; they will not require any trouble of covering, and will fucceed the aultumnal plants regularly in bloom, and will flower in goci perfection. Thus by two or three different plantings you may obtain a fucceffion of thefe bcautiful flowers in conftant bloom from April till the middle of Junc; but the autumnal plants, for the general part, not only flower ftrongef, but the roots inercafe more in fize, and furnifh the beft off-fets for propagation : it is, however, proper to plant both in fpring and autumn.

Prepare for the choicer forts four-feet beds of light earth, and rake the furface fmooth : then plant the roots in rows lengthwife the beds, either by drilling them in two inches decp, and fix inches diftance in the row, and the rows fix or eight afunder; or you may plant them by bedding-in, or by dibble-planting, the fame depth and diftance.

Thofe defigned for the borders fhould be planted ge-

## R A P

Kanuncu- nerally towards the fpring, in little clumps or patches, Ius three, four, or five roots in each, putting them in either with a dibble or trowel, two or three inches deep, and three or four afunder in each patch, and the patches from about three to five or ten feet diftance, placing them rather forward in the border.

Propagation. All the varieties of the Afratic ranunculus propagate abundantly by off-lets from the root, and new varictics are gained by feed.-1. lby off-fets. The time for feparating the off-fets is in fummer when the flower is pait, and the leaves and falks are withercd : then taking up all the roots in dy'y weather, Ceparate the off-fets from each main root, and after drying the whole gradually in fome thady airy room, put them up in bags till the autumm and fring feafons of planting; then plant then as before, placiag all the offfets in leparate beds: many of them will blow the firlt year, but in the fecond they will all thwer in good perfec-tion.-2. By feed. Save a quantity of feed from the finelt femi-double flowers, and fow it either in Augult, or in March, or April, though, to fave trouble of win-ter-covering, fome prefer the fpring: it fhould be fowed in light rich mould, either in pots or in an eaft border, drawing very fhallow flat drills five or fix inches :funder, in which fow the feeds thinly, and cover them lightly with earth, giving frequent refrethments of water in dry weather, and in a month or fix weeks the plants will rife with fmall leaves ; obferving to continue the light waterings in dry weather, to preferve the foil moit during their fummer's growth to increafe the fize of the roots; and in June when the leaves decay, take up the roots and preferve them till the feafon for planting, then plant them in cominon beds, as before direeted, and they will flower the fpring following, when all the doubles of good properties thould be marked, and the fingles thrown away.

The juice of many fpecies of ranunculus is fo acrid as to raife blifters on the $\mathfrak{l k i n}$, and yet the roots may be caten with fafety when boiled.

RAPACIOUS animals, are fuch as live upon prey.

RAPE, in law, the carnal knowledge of a woman forcibly and againft her will. This, by the Jewilh law, was punifhed with death, in cafe the damiel was betrothed to another man: and, in cafe fhe was not betrothed, then a heavy fine off fifty fhekels was to be paid to the damfel's father, and the was to be the wife of the ravifter all the days of his life; without that power of divorce, which was in general permitted by the Mofaic law.

The civil law punifhes the crime of ravifhment with death and confication of goods: under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and alfo the prefent offence of forcibly dillnnouring her; either of which, without the other, is in that law fullicent to conflitute a capital crime. Alfo the ftealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's ediet, whether fhe confent or is forced. And this, in order to take away from women cvery opportunity of offending in this way; whom the Roman laws fuppofe never in go aftray without the feduation and arts of the other fes; and therefore, by reftraining and making fo highly penal the folicitations of the men, they meant to lecure effeiually the honour
of the women. But the Englifla liw docs not enter. Rape taill quite fuch fublime ideas of the honour of either fex, as to lay the blame of a mutual fault upon one of the tramfgetfors only ; and therefore makes it a necelfary ingredient in the crime of rape, that it moit be againf the woman's will.

Rape was punilhed by the Sason laws, particularly thofe of king Athelilin, with death; which was :hlo agreeable to the old Gothic or Scandinas ian conflitition. But this was afterwards thought too hard : and in its flead anobher fevere, but not capital, punifhment was inflifed by William the Conqueror, vi\%, cafration and lofs of eyes; which enntinued till after liracton wrote, in the reign of Fienry IlI. Bat in order to prevent malicious accufations, it was then the law (and, it fecms, fill continues to be fo in appeals of rape), that the wom:n thould, inımediately after, go to the next town, and there make difcovery to fome credible perfons of the injury the has fuffered; and afterwards fhould acquaint the high conftable of the hundred, the coroners, and the fherifi, with the outrage. This feems to correfpond in fome degree with the laws of Scotland and Arragon, which require that complaine mant be made within 24 hours: though afterwards by flatute Weftm. 1. c. 13. the time of limitation in England was extended to 40 days. At prefent there is no time of limitation fixed : for, as it is pitally now rnnilhed by indiofment at the fuit of the king, the maxim of law takes place, that " nullum tempns occurrit regi:" but the jury will rarely give credit to a fale complaint. During the former period alfo it was held for law, that the woman (by confent of the judge and her parents) might redeem the offender from the execution of his fentence, by accepting him for her hufband ; if he altn was willing to :gree to the exchange, but not otherwife.

In the 3 Edw. I. by the fatute Weflm. I. c. 13. the punifhment of rape was much mitigated: the offence itfelf, of ravilhing a damfel within age, (that is, twelve years old) either with her confent or without, or of any other woman againft her will, being reduced to a trejpafs, if not profecuted by appeal within 40 days, and fulljecting the offender only to two years imprifonment, and a fine at the king's will. But this lenity being produetive of the molt terrible confequences, it was in ten years afterwards, 13 Edw. 1. iound neceflary to make the offence of forcible rape felnny by liature WeRm. 2. c. 34. And by ftatute 18 Eli_. c. 7 . it is made felony without benefit of clergy: as is alfo the atominable wickednef's of carnally knowing or abufing a:iy woman-child under the age of ten jears; in which cate the confent or non-confent is immaterial, as by reafon of her tender years the is incapable of judgment and diferction. Sir Mathew Hale is indect of cpinion, that fuch profligate astions committed on an infant un. der the age of twelve years, the age of fenale dicicretion by the common law, either with or without confent. amount to rape and felony; as well fince as before the fatute of queen Elizabeth : but that law las in general been held only to extend to infints underten ; though it fhould feem that damfels between ten and twelve are fill ander the protection of the fiatute $W$ Veftom. i, the law with refpect to their fedustion not having becn al. tered by either of the fubfequent flatutes.

A male infant, under the age of feurteen ecars, is

R:ヶ. -
prefomed by law incapabie to commit a rape, and theretore it feens cannot be found guilty of it. For though ia shur felonies " maliti. dupplet xtusem ;" eet, as to this patticulat frecies of Selany, the law tuppoles ambecility of hody as well as mind.

The civil law feens to fuppere a proftute or com. mon inalet incapable of any in juries of this hind: not all wiry any punifment for voluting the chattity of her, whin hath in'eced no clantisy at ant, or at lealt nath no regard to it. But the law of lingland does not julge in lardly of cfienders, as to cut of all opporturity d retreat even from common ft. umpets, and to treat them as never capable of amendinent. It therefice holds it to be felony to force even a concubine or harlo: ; becalue the woman may have fordaen that malawful enurie of life: for, as Baspon we!l obiernes, "licet metetrix fuerit antea, certe tunc 1. -mponts nom fuit, cum reclamando $1^{*}$ quitia ejus consetace nolnit."

As to the material fakts requifite to be given in evithence and proved tapon an indidment of rape, they are of fich a nature, that, though neceflary to be known and fetted, for the convifion of the guilty and prefervation of the innucent, and therefore are to he found in fuch criminal treatifes as ditcourfe of thefe matters in decail, yet they are highly improper to be publickly dif. coided, except enly in a court of jullice. We thall therefore menely add upon this hasd a few remarks from Sir Mathew IJale, with regard to the competen-
 be contidered.

And, firt, the party ravifhed may give evidence upon eath, and is in law a competent witnef; but the credibility of her teftintony, and low far forth the is to be believel, muft be left to the jury upon the circumftances uf fact that concur in that teftimony. For inflance: if the wienefs be of good fame; if the prefently difcovercd the ollence, and made fearch for the offender ; if the prarty accufed fled for it ; thefe and the like are concurring circumfances, which give greater probability to her evidence. But, on the other fide, if the be of evil fame, and fand unfupported by others; if the concealed the injury for any conliderable time after fhe had "plortunity to eomplain; it the place, where the fact wils alleged to be committed, was where it was poflible the might have been heard, and the made no outcry: theic and the like ciscumftances carry a frong, but not conciufive, prefumption that her teitimony is falfe or feigned.

Moreover, if the rape be chared to be committed on an intant under 12 years of age, the may nill be a conmetent witnefs, if the liath fenfe and underfanding to bruns the nature and chligations of an oath; alld, even if the hath not, it is thought by Sir Matthew Hale, that the ought to he heard without oath, to give the comt information; though that alone will not be futficient to ennvit the offender. And he is of this epition, firt, Becanfe the rature of the offence being feese, there may the no other poffible proof of the atual fuot: though ifterwads there may be concurrent circurnfances in corroborate it, proved by other witnelles: and, fecondly, lecaufe the liw allows what the child told her mother, or cher rela. tions, to be given in evidence, fince the mature of the
cafe admits frequently of no better pronf; and there is much more reafon for the court to hear the narration of the clitd herfelf, than to reccive it at fecondhand from thofe who fwear they heard her liy fo. And indeed it feems now to be fetted, that in thefe cafes infonts of any age are to to be heard ; and, if they have any idea of an cath, to be alfo fworn: it being found by experience, that infants of very tender ycars ofien give the elearell and truch tellimony. But in :any of thefe cales, whether the child be fiworn or not, it is to be wifhed, in order to render her evidence credible, that there thould be fome concurrent teftimony of time, place, and circum layes, in order to make out the fast and that the comption fhould not be grounded fingly on the unfupported accufation of an infant under yuars of difcretion. There may be therefore, in many cafes of this nature, witnelfes who are competent, that is, who may be adnitted to be heard; and yet, after being heard, may prove not to be credible, or fuch as the jury is bound to believe. For one excellence of the trial by jury is, that the jury are triers of the credit of the witnefles, as well as of the truth of the facs.
" It is true (fays this learned judge), that rape is a molt detcfalle crime, and therefore ought feverely and impartially to be punilhed uith death; but it mult be remembered, that it is an accufation eafy to be made, hard to be proved, but liarder to be defended by the party acculed, though imocent." He then relates two very extraordinary cafes of malicious profecution for this crime that had happened within his own obfervation; and concludes thus: " I mention thefe inflances, that we may be the more cautious upon trials of offences of this nature, wherein the court and jury may with fo much eare be impofed upon, without great care and vigilance; the heinonfnefs of the offence many times cranfporting the judge and jury with fo much indignation, that they are over-hatily carried to the conviction of the perfons acculed thereof, by the contiftent teftimony of fometimes falfe and malicious witneffes."

RAPHAEL (D'Urbino), the greatelt, moft fublime, and moft excellent painter that has appeared, fince the revival of the fine arts, was the fon of an indifferent painter named Sansio, and was born at Urbino on Good Friday 1482. The popes Julius II. and Len X. who employed him, loaded him with wealth and honour; and it is faid that cardinal De St Bibima had fuch a value for him that he offered him his niece in marriage. His genius is admired in all his pictures; his contours are liree, his ordonnances magnificent, his deligns corred, lis figures elegant, his expreflions live. $1 y$, his attitudes natural, his heads graceful ; in fine, every thing is beautiful, grand, fublime, jult and adorned with graces. Thefe various perfections he derived not only from his excellent abilities, but trom his thdy of antiquity and anatomy ; and from the friendnip he contrated wi:h $\Lambda$ rioflo, who contributed not a little to the improvement of his tatle. His pictures are prinripally to be found in Italy and Paris. That of the Transtiguration, preferved at Rome in the church of Sit Peter Montcrio, pilles for his malter piece. He hatd a handfome perfon, was well proportioned, and had graat fucetnefs of temper ; was pulite, affable, and mo-

Raphaim def. He, however, lived in the utmof fplendor; moft of the eminent mafters of his time were ambitious of working under him; and he never went out without a crowd of artifts and others, who followed him purely through refpect. He was not only the beft painter in the world, but perhaps the beft architedt 100 ; on which account Leo X. charged him with building St Petcr's church at Rome: but he was too much a dicted to pleafure, which occafioned his death at 37 years of age. He left a great number of difciples; among whom were Julio Romano and John Francis Perni, whon were his heirs. Many able engravers, as Raimondi, Georgc Mantuan, and Bloematt, engraved after Katphael. Sce Painting, p. 595 and $59^{8}$.

PAPHAIM, or Rephaim, (Mofes, a name fignifying Giunts, as they really were, and an actual people too, fituated in Bafan or Batanea, beyond Jordan, icparated from the Zamzunimim by the river Jabbok. Alio a valley near Jerufalem; Jofhua $x$.

RAPHANUS, RADISH; a genus of the filiquofa order belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 3 th order, Siliquof2. The calyx is clofe; the filiqua torofe, or fwelling out in knots, fubarticulated, and round. There are two melliferous glandules between the thorter ftamina and the piftil, and two between the longer famina and the calyx.

There is only one fpecies, viz. the fativus, or common garden radifh; of which there are feveral varieties. They are annual plants, which being fowed in the fpring, attain perfection in two or three months, and fhoot up foon after into ftalk for flower and feed, which, ripening in autumn, the whole plant, root and top, perifhes; fo that a frefh fupply muft be raifed annually from feed in the fpring, performing the fowings at feveral different times, from about Chiftmas until May, in order to continue a regular fucceffion of young tender radifhes throughout the feafon: allowing only it fortnight or three weeks interval between the fowings; for one crop will not continue good longer than that fpace of time, before they will either run to feed, or become tough, fticky, and too hot to eat.

RAPHANIDOSIS, a punifhment inflicted at Athens upon adulterers. The manner of it was this: The hair was plucked off from the privates of the offender, hot afhes laid upon the place, and a radith or mullet thruft up his fundament, as has been mentioned inder Adultery. I'o this Juvenal alludes, Saf. x. ver. 317. Quofdam m.rcios et mugilis intrat. Perfons whohad been thas punified were called utporxtor. the word riphonidofis is derived from poçars, a radin.

RAFHIDDIA, in zoology ; a genus of infects, of the neuroptera order; the characters of which are thefe : The head is of a horny fubtance, and depreffed or flutened: the mouth is armed with two tecth, and furnifhed with four pulpi: the femmata are three in number: the wings are defected: the antennx are filiform, as longr as the thorax; the anterior part of which is lengthencd out, and of a cylindrical form: the tail of the female is terminated by an appendix, refembling a flexible crooked brifte.-There are three fpecics. The mot remarkable is the ophiopfis; which for its Shape is one of the moft fingular that can be $t$ Plate reen $\dagger$. It has an oblong head, haped like a lieart, cecexizr. Vol. XVI.
with its point joined to the tharax, and thec broad part before. It is fmooth, black, fattened, continual!! thaking, with fhort antenne, jellowith maxiilx, asd four palpi. 'lowards the middle of the upper pater: the head, between the eyes, ate the three Itemmata, placed in a triangle. The thorax, to which this hasd is faftened, is narrow, long, and cylindrical. The ab. domen, broader, is black like the reft of the body, with the fegments margined yellow. The feet are ol a yellowifh caft. The wings, which are faltigiated, are white, diaphanous, veined, and as it were covered with a very fine net-work of black. This infed, in The figure of its head, refembles a fnake. It is found but feldom, and in woods only. Its larva, claryfulli, and habitation, are abfolutely unknown.

RAPIER, formerly fignified a long old-fanhinnel fword, fuch as thofe worn by the ccmmon folfiers: but it now denotes a fmall fword, as contradifinguill:cd from a back-fword.

RAPIN (Rene), a Jefuit and eminent French writer, was born at Tours in 1621 . He taught folice literature in the fociety of the Jefuits with greit applaufe, and was juftly efteemed one of the beit Latin pocts and greatelt wits of his tinie. He died at P.iris in 1687 . He wrote, 1. A great rumber of Latin poems, which have rendered hinn famous throughout all Europe; among which are his Hortorum libri quatuor, which is rectoned his mafter-piece. 2. Reflections on Eloquence, Poctry, Hiftory, and Philcfophy. 3. Comparifons between Virgil and Homer, Demofthones and Cicero, Plato and Aritotle, Thi:cydides and Titus Livius. 4. The hiftory of Janfenifm. 5. Several works on religious fubjects. The beft edition of his Latin poems is that of Paris in 1723 , in 3 vols 12 mo .

Rapin de Thoyras (Pulde), a celebrated hitorian, was the fon of James de Rapin lord of Thoyras, and was born at Caltres in 1661 . He was cducated at firft under a tutor in his father's houle ; and afterwa:c'; fent to Puylaurens, and thence to Saumur. In 1679 he returned to his father, with a defign to apply him.felf to the ltudy of the law, and was admitted an advocate: but fome time after, relecting that his being a Proteftant would prevent his advancement at the bar, he refolved to quit the profeflion of the law, and apply himfclf to that of the fword; but his father would not confent to it. The revocation of the edict of Nantes in 3685 , and the death of his fither, which happened two months after, made himn refolve to go to England; but as he had mohopes of any fettlement there, his ftay was but fonrt. He therefore fonn after went to Holland, and lifted limfelf in the company of French volunteers at Utrecht, commanded by M . Rapin his coufin-german. He attended the Prince of Orange intn England in 1688 : and the following year the Lord Kinglon made liman enfign in his reginictit, with which he went into Ircland, where he galined the eftcem of lis officers at the fiege of Cirrickferguc, and had foon a lieutenant's commiffion. He was prefent at the battle of the lioync, and was hot thro' the fhoulder at the fiege of Limerick. He was foon after captain of the company in which he hid been enfign; but, in 1 ón3, religned lis company to one of his bro. thers, in order to be tutor to the carl of Portland's

Papice,
1イаию.
fun. In 1690, he married Marianne T'eltard, ; but this murisige nerther abated his care of his pupil nor prevented lis accompanying him in his travels. Having finifed this employment, be returned to his family, which be had lettled at the H.ague ; and here he conti.ued fome years. Dut as he found his family increafe, he refolved to retire to fome chap country ; and acordingly removed, in $1 ; 07$, to Wefel, where he wrose lis Hillory of England, and fome other picces. Though he was of a llrong conllitution, yet feventeen gear application (for fo long was he in compoling the hittory jutt mentiencd) entirely ruined his heatth. He ifed in $1 / 25$. He wrote in French, 1. A Dillertation on the Whigs and Tories. 2. His Hittory of Enghand, printed at the Hague in 1726 and 1727 , in 9 wols ato, and reprinted at Trevoux in $172 \Omega$, in 10 vols 4: W. This late edition is more complete than that of the Haguc. It has been tramfated into Englith, and improved with Notes, by the Reverend Mr Tindal, in 2 vols felio. This performance, though the work of a foreisner, is defervedly efteemed as the fulleft and roof impartial collestion of Englifh political tranficzoons ext.nt. The readers of wit and vivacity, however, may be ant to complain of him for being fometimes rat ther tedisus and dull.

RAPINE, in law, the taking away another's goods ©c. by violence.

RAPPERSWIL, a town of Swifferland, on the confines of the canton of Zurich, and of the territory of Gatker, with an old caftle it is Arong by fituation, being feated on a neck of land which advances into the lake of Zurich, and over which there is a liridge 850 paces long. It is fubject to the cantons of Zurich and Berne. E. Long. 8. 57. N. Lat. 47. 20.

RAPP OLSTEIN, a town of France in Upper Alface, which, before the Revolution, had the title of a barony. All the muficians of Alface likewife depended upon this baron, and were obliged to pay him a certain tribute, without which they could not play upon their infruments. E. Long. 7.28. N. Lat. 48. 15 .

RAPTURE, an ceftaly or tranfport of mind. See Extasy.

RARE, in phyfics, ftands oppofed to denfe ; and denotes a body that is very porous, whofe parts are at a great diance from one another, and which is fuppofed to contain but little matter under a luge bulk. Sec the following article.

RAREFACTION, in phyfics, the act whereby a body is rendered rare; that is, brought to poffefs more room, or appear under a larger bulk, without acceffinn of any new matter.-This is very frequently the offer of fire, as has long been univerfally allowed. In many cafes, however, pluitofophers have attibuted it to the action of a repulfire principle. However, from the many difenveries concerning the mature and properties of the elefric fluid and fire, there is the greatef reafon to believe, that this repulfive principle is no other than elemen"ary fire. See Repulsion.
liAS EL-Fble one of the frontier provinces of A. byffinia, of which the late celebrated traveller Mr Bruce was made governor while in that country. It is but of fmall extent, and in its mon profierous fate contained only 39 villiges. The climate is extremely hot, in Mr Bruce's opinion one of the hotteft in the world. He informs us, that on the firft day of March, at three
o'clock in the afternoon, the thermometer flood at $114^{\circ}$ in the fhade, and in the evening at $82^{\circ}$; though at funrife it had been no higher than 61. Nowwithanding this appearance of extreme heat, however, the fenfation was by no means intolerable; they could hunt at mid-day, and felt the evenings rather cold. The foil is a f.tt, loofe, black cath, which our author fays is the fame from $13^{\circ}$ to $16^{\circ}$ of north latitude; at leat till we come to the deferts of Atbara, where the tropical rains ceafe. This country divides that of the Shangalla into two parts, nealy equal. Thefe people in habit a belt of land about 60 miles broad, all along the northern frontier of Abyffinia, excepting two Large gaps of fpaces which have been left open for the fake of commerce, and which are inhabited by frangers, to keep the Shangalla in awe. 'The later trade in gold, which they pick up in the ftreams as it is walhed down from the mountains; for there are no mines in their country, neither is there any gold in Abyfinia, excepting what is imported from this or fome other country. The Shangalla are the natural enemies of the inhabitants of Ras cl.Fcel, and much blood has been fhed in the various incurfions they have made upon one another ; though of late thofe of Ras-el.Feel, by the affirance of the emperors, have been enabled to keep the Skiangalla at bay:
RAS.SEm, a city of Tripoli in Barbary, concerning which a number of fables were told by the Tripoline ambaffador, all of which were believed in England and other parts of Europe in the begnning of this century. (See Pritified-City). Mr Bruce informs us, that it is fituated about five days journey fouth from liengazi; but has no water excepting one fonntain, which has a difagrecable, tafte, and feems to be impregnated with alum. Hence it has obtained the name of Ras-Sem, or the fountain of poifon. The only remains of antiquity in this place confift of the ruins of a tower or fortification, which, in the opinion of Mr Bruce, is as late as the time of the Vandals; but he fays he cannot imagine what ufe they made of the water, and they had no other within two days journey of the place.Here our traveller faw many of the animals called jerboa, a kind of mice; which, he fays, feem to partake as much of the nature of a bird as of a quadruped.

RASAY, one of the Hebrides Inands, is about I3 miles long and 2 broad. It contains 700 inhabitants, has plenty of lime-ftone, free-ftone; and feeds great numbers of black cattle ; but has neither deers, hares, nor rabbits. The only appe:rance of a harbour in Rafay is at Clachan Bay, where Mr Macleod the proprietor of the itland refides. Rafay prefents a bold thore, which rifes to the height of mountains; and here the natives have, with incredible labour, formed many little corn fields and potato grounds. Thefe heights decreale at the fouth end, where there are fome farms ind a goodlooking country. Mr Macleod is fole porprietor of this ifland, and of Rona and Fladda at the north end of it, which are only proper for grazing.
The houfe of Rafay is pleafantly fituated near the fouth-weft end of the ifland, which is the moft level part of it. It has an extenfive and excellent garden, and is furrounded with foreft trees of confiderable magnitude; another proof that trees will grow upon the edge of the fea, though it muft be allowed that the channel

channel here is natrow. Immediately behind the houfe of Rafay are the ruins of an ancient chapel, now ufed as the family burying-place.

Dr Johnfon, in his Tour, expreffes the higheff fatisf.cticn at the reception he met with when in Ralay from Mr Macleod.
R.ASCIANS, a poor oppreffed people who dweit on boik fides of the Danube, and who, about the year $159+$, being weary of the Turkif, thraldom, firt took I 3 of their veifels upon that river; and then drawing together a body of fitteen thoufand men between Buda and Belgrade, twice defeatcd the pâhtia of Temefwar with a budy of fourtzen thoufand Turks. They afterwards took Baczkerek, four mile; from Belgrade, and the caftle of Ottadt ; then laying fiege to that of Beche, on the Theyflit, the old pâthầ of I'cmefwar marched to relieve it with eleven thoufand men; but the Rafcians encountering them, flew near ten thoufand, and took 18 pieces of cation. The confeguence of this vietery was the reduction of Werfet $\% a$ and Luts. Then, fending to the archduke for aid and gunners, they offered to put themelves and their country under the emperor's protection.

## RASOR-bill. Sce Alea, ro 4.

R.asor-Fi/h. See Solem.

RAS'PALL (Johu), a printer and mifcellaneous writer, was born in London, probably about the end of the 15 th century, and educited at Oxford. Returning from the univerfity, he fetded in the metropolis, and commenced printer, "then eftecmed (fays Wood) a profeflion fit for any fcholar or ingeninus man." He married the fifter of Sir Thomas More, with whom, we are told, he was very intimate, and whofe writings he Atrenuoully defended. From the title-page of one of his bonks, he appears to have lived in Cheaplide, at the fign of the mermaid. He died in the year 1536; and left two fons, William and John : the firft of whom became a judge in queen Mary's reign, and the latter a jultice of peace. This John Raltall, the fubjert of the prefent article, was a zealous Papif; but Bale fays, that he changed his religion beforc his death. He wrote, 1. Natura naturala. Iits calls it a copious (prolixa) and ingenious comedy, defcribing Europe, Afiat, and Africa; with cuts. What fort of a comedy this was, is not eafy to conceivc. Probably it is a cofmographical defcription, written in dialogue, and therefore nyled a comedy. 2. The pattyme of the people; the cronycles of diverfe realmys, and moft efpecially of the realm of England, brevely compiled and emprinted in Cheapefyde, at the fign of the mearmaid, next Pollyfyate, cum prisiligio, fol. 3. Ecclifa Fobannis Rafsall, $15+2$. Wis inc of the prohibited books in the reign of Henry VIII. 4. Legum Anglicanarum voca. bula explicala. French and Latin. Lond. 1567, Svo. And fome other wnoks.

RASTADT, a town of Germany, in the circle of Suabia and marquifate of Baden, with a handfome caltle. It is remarkable for a treaty concluded here between the French and Imperialits in 17 t4; and is feated on the river Merg, near the Rhine. E. Long. 9. I4. N. Lat. $4^{8 .} 52$.

RASTENBURG, a fine city in Pruflia, on the Gu. ber, furrounded with a wall, and fince 1629 alfo with a rampart.

RAT, in zoology. Sce Mus.
The following receipt is frid to have been found effezual for the defrnction of rats. Take of the fects of f:avefacre or loufewort, powdered, more or lefs as the occafion requires, one past ; of oat-meal, th:ce parts ; mix them well, and make them up iato a palte wihh honey. Lay pieces of it in the holes, and oa the places where mice and rats frequent; and it will effectually kill or rid the place of thofe kied of vermin bs their eating thereof.

Some time ago, the fociety for encouraging arts propofed a premium of 501 . fur al preparation capable of alluring or fafcinating rats fo, that they might be taken alive. In confequence of this, a great number of new traps, \&c. were invented; and the following methods of alluring the rats to a certain place were publithed.

One of thofe moft cafily and efficaciounly practied is the trailing fome pieces of their moft favourite fond. which thould be of the kind that has the Atrongeft feent, fuch as toafted cheefe or broiled red herrings, from the holes or entrances of the clofet to their recelfes in every part of the houre or contiguous building At the cxtremities and in different parts of the courfe of this trailed track, fmall quantities of meal, or any other kind of their food, thould be laid, to bring the greater num. ber into the tracks, and to encourage them to purfue it to the place where they are intended to be taken: at that place, when time admits of it, a more plentiful repaft is laid for them, and the trailing repeated for two or three nighis.

Befides this trailing and way-baiting, fome of the moft expert of the rat-catchers have a florter and perhaps more effeetual method of bringing them together ; which is the calling them, by making fuch a whittling noife as refembles their own call; and by this means, with the affilance of the way-baits, they call them out of their holes, and lead them to the repalt prepared for them at the place defigned for taking them. But this is much more difficult to be prastifed than the art of trailing; for the learnirg the exact notes or cries of any kind of beafts or birds, fo as to deceive them:, is a peculiar talent which is feldom attained: though fome perfons have been known who could call together: great number of cats ; and there was a man in Londun who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his hand, fo as to be taken.

In practifing either of thofe methods, of trailing or calling, great caution mult be ufcd by the operator to fupprefs and prevent the feent of his feet and body from being perceived; which is done by overpowering that fcent by others of 2 Atronger naturc. In order to this, the feet are to be covered with cloths rubbed over vith? afiffetida, or other flrong-fmelling fibstances; and eve:1 oil of rhodium is fometimes ufed for this perpofe, but fparingly, on account of its dearnefs, though it has a very alluring as well as difguifing effert. If this caution of avoiding the fcent of the operator's feet, near the track, and in the place where the rats are propofed to be collected, be not properly obferved, it will very much obftruct the fuccefs of the attempt to taie them; for they are very thy of coming where the feent of human fect lies very frefh, as it intimates to their f.gacious inftinet the prefence of human creatu:es, whon they
naturaily dread. To the abovementioned means of al larmg by tralhy, way-baiting, and calling, io addes arother (1:a very material efic..cy, which is, the ufe of oil at inodum, which, like the marum Sytacum in the cafe of curs, has a very extraordinay facinatiug power on the fe a: innals. 'This oil is catrumely dear, and theretine faringly ufed. It is exalted in a fin.ll quancity in the place, and at the entance of it, where the rats are jatcrided to be taken; particularly at the time when they ate to be lat brought toguther, in order th their dearreaton; and it is ufud ati) by fneating it on the 1.atice of fome of the inplements ufed in taking by the nethod below deferibed; and the effect it has in taking Af theit caution and dread, hy the delight dicy appaer nhave in it, is very extraordmaty.

It is unat, likeswife, for the operator to difguife his figure as well as feen:, which is done by putting on a fint o! gown or clask, of one colour, that lides the batural firm, and makes himappear like a poot or fome fich manmate thing; which habit mult likewife be fiensud as above, to overpower the fmell of his perion; and belides this, he is to avoid all motion till he has fecurcd his point of having all the rats in his power.

When the rats are thus enticed and collesked, where time is afturded, and the whole in any houfe and outbuil lings are intended to be cleared away, they are futfered to regale on what they molt like, which is ready prepared for them, and then to go:tway quietly for two u.r three nights; by which means thofe that are not allured the firt night are brought atterwards, either by their fellows, or the effeets of the trailing, scc. and will not fail to come duly again, if they are not diflurbed or molefted. But many of the rat-catchers make fhortor work, and content themfelves with what can be brought together in one night or two; but this is never cffetual, unlefs where the building is fmall and entire, and the rats but few in number.

The means of taking them, when they are brought rogether, are various. Some entice them into a very harge bag, the mouth of which is fufficiently capacious whover nearly the whole floor of the place where they are collected; which is done by fmearing fome veffel, placed in the midjle of the bag, with oil of rhodium, and laying in the birg baits of food. This bag, which before lay flat on the ground with the mouth fpread ( pen, is to be fuddenly clofed when the rats are all in. Uthers drive or fright them, by fight noifes or motions, into a bag of a long form, the mouth of which, alter all the rats are come iu, is drawn up to the opening of the phace by which they entered, all other ways of retreat being fecured. Others, again, intoxicatc or poifon them, by mising with the repalt prepared for them the coculus Indicus, or the rus vomica. They dire ef four ounces of the coculus Ind.cus, with twelve ounces of oatmeal, and two nunces of treacle or honey, made into a moifl pafte with frong-beer : but if the nux yomica be efed, a much lefs proportion will fiwe than is here given of the coculus. Any fimilar compofition of there drugs, with that hind of lood the rats are moft fond of, and which has a frong flavour, to hide that of the druers, will equally well anlwer the end. If indeed the coculus Indicus be well powdered, and infured in Ilrong-beer for fome time, at leaf half the quantity here directed will ferve as well as the quatuty before-mentioned. When the rats appear to be thoroughly in-
tonicated with the coculus, or fick with the nux vomica, Rat - filand they may be taken with the hand, and put into a bag or cage, the door of the place being firft drawn to, left $\qquad$ $\underbrace{\text { Ratcs. }}$ thove who have Atrength and fenfe renaining efcape.
K.ar-flanil, a dmall detached part of the ill.ind of Lundy, off the north coalt of Devon. Thourh noted in Dum's map of the county, it is not worth mention here, but as giving opportunity to fubjoin a farther notice of Lundy, which illard was purchafed a few years fince by Mr Cleveland M. P. for about 1200 guincas, who has a fmall villa on it : not nore than 400 acres are cultivated: it is let altogether for 701 . a year. The foil is good, though no trees will grow on the ifland. It has finc fiprings of water: the houfes are feven : the in:2abitants, men, women, and children, do not excced 24. The biad callud murr, whote eggs are very large and fine, the Lundy parrot, and rabbits, are the chief produce ; the efe abound, and ane taken for the feathers, egyes, and kins, principally. 'Ihey have now ( $59+$ ) 70 bullocks and 400 theep, but the latter do not thrive. They par no taxes: fifhing fkiffs often call with necelfaries: the fituation is very pleafant, and the rocks around, which are large, and partly granite, are wild, romantic, and novel. It had prolably more inlabitants once, as human boncs have been ploughed up. It has no place of worfhip, nor public-houfe ; but Arangers ate always welcome. Eight cannon lie on the battlements on the top of a very fleep precipice, under which is a curious cavern. Lord Gower, Mr Benfon, and Sir J. B. Warren, K. B. have been former proprietors. See Lundy.

Rat-Tails, or Arrefts. See Farrierr, § xxsvii.
RATAFIA, a fine firituous liquer, propared from the kernels, \&\&c. of feveral kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruifing the cherries, and putting them into a velfel whercin brandy has been long kept; then adding to them the kernels of cherries, with Itrawberries, Lugar, cinnamon, white pepper, nutmeg, cloves; and to 20 pound of cherrics is quarts of brandy. The veffel is left open ten or twelve days, and then itopped clofe for two neonths before it be tapped. Ratatia of apricots is prepared two ways, viz. either by boiling the apricots in white-wine, adding to the liquor an equal quantity of brandy, with fugar, cinnamon, mace, and the kernels of apricots; infuting the whole for cight or ten days; then ftraining the liquor, and putting it up for ufe: or elfe by infufing the apricots, cut in pieces, in brandy, for at day or two, parffung it through a fraining bag, and then puting in the ufual ingredients.

RA'TCH, or rash, in clock-work, a fort of wheel having twelve fangs, which ferve to lift up the detents every hour, and nask the clock frike. See Clock.

RATCHETS, in a watch, are the fmall tecth at the bottom of the fufy, or barrel, which ftops it in winding up.

RATE, a ftandard or proportion, by which cither the quantity or value of a thing is adjufed.

RATES, in the navy, the orders or clafes into which the flips of war are divided, according to their force and magnitudc.

The reculation, which limits the rates of men of war to the fmalleft, number poffible, feems to have been dictated by contiderations of political conomy, or of that

## R A T

Rates.
of the fimplicity of the fervice in the royal dock-yards. The Britifh fleet is accordingly cillributed into fix rates, exclulive of the inferior velfels that ufually attend on naval armaments ; as flcops of war, armed fliss, bonibketches, fire-fhips and cutters, or felhooners commanded by lieutenants.

Ships of the firf rate mount ico cannon, having $42-$ pounders on the lower deck, 24 -pounders on the mids!e deck, 12 -pounders on the upper deck, and 6 -pounders on the quarter-deck and fore-cafle. They are manned with 850 men , including their officers, feamen, marines, and fervartis.

In eneral, the fhips of every ra:e, befides the captain, have the mafter, the boatwain, the gumuet, the chaplain, the purfer, the furgeon, and the carpenter ; all of whom, except the chaplain, have their mates or aflithants, in which are comprelended the fill-maker, the mafter at arms, the armourer, the captain's ceerk, the gunfnith, sec.

The number of other officers are always in proportion to the rate of the fhip. Thus a firlt 1 ate has fix licutenants, fix mafer's mates, twenty-four midhipmen, 2nd five furgeon's mates, who are cmfidered as ge atemen : befides the following petty officers; quarter-mafters and their mates, fourteen; boatfwain's mates and geomen, eight ; gunner's mates and affiftants, fix ; quar-ter-gunners, twenty-five; carpenter's mates, twn, belides fourteen affifants; with one ile ward, and feward's mate to the purfer.

If the dimenfions of all thips of the fame rate were equal, it would be the fimpleft and moft perficicuous mathod to collect them into one point of riew in a table : but as there is no invariable rule for the general dimenfions. We muf content onrfelves with but a few remarks on thips of each rate, fo as to give a gencral idea of the difference between then).
The Viftory, one of the lat built of the Britifh firt rates, is 222 feet 6 inches in length, from the head to the ftern; the length of her keel, 151 feet 3 inches; that of her gun-deck, or lower deck, 186 feet; her extreme breadth is 51 feet 10 inches; her depth in the hole, 21 feet 6 inches; her burden, 2162 tons; and her poop reaches 6 feet before the mizen-man.

Ships of the fecond rate carry 90 guns upon three decks, of which thofe on the lower battery are 32. pounders ; thofe on the middle, 18 -pounders; on the upper deck, 12 -pounders; and thofe on the quarterdeck, 6 -pounders, which ufually amount to four or fir. Their complement of men is 750 , in which there are fix lieutenants, four mafter's mates, $2+$ midhipmen, and four furgenn's mates, it yuarter-malters and their ma:es, eight boatfwain's mates and yeomen, fix gunner's mates and yeomen, with 22 quarter-gunners, two carpenter's mates, with 10 affiftants, and one feward and feward's mate.

Ships of the third rate carry from $G_{+}$to 80 cannon, Which are 32,18 , and 9 -pounders. The $80-g$ un thips however begin to grow out of repute, and to give way to thofe of 74, 70, Sc. which have only two whole battcrics; whereas the former have three, with 28 guns planted on each, the cannon of their upper dect being the fame as thofe on the quarter-deck and fore-cafle of the latter, which are 9 -pounders. The complement in a $7+$ is 650 , and in a 64,500 men; having, in peace, four licuicnants, but in war, fire; and when an admiral
is aboard, fix. They have three mater's matcs, 16 midhipmen, three furgeon's mates, 10 quarter-mafters and their mates, lix boatfwain's mates and yeomen, four gunner's mates and yeomen, with 18 quarter-gumners, one carpenter's mate, with eight aflifants, and one llewand and Aeward's mate under the purfer.

Sh ps of the fourth rate mount from 60 to 50 gurss, upon two decks, and the quarter-deck. The lower tie: is compoled of 24 -pounders, the upper tier of 12 pounders, and the cannon on the quarter-deck and furc-caftie are 6 -pounders. The consplement of a 50 gun thip is $350 \mathrm{~m}: \mathrm{n}$, in which thete are three licuterants, two nafler's mites, 10 midfhipmen, two furgeon's mates, cight quarter-mafters and their mater, four boatwain's mates and yeomen, one gunner's nate and one yeoman, with 12 quarter-gunners, one curpenter's mate and fix affintunts, and a feward and Iteward's mate.

All vefficls of war, under the fourth rate, are ufua!ly comprehended under the general name of frigut, and never appear in the line of battle. They are divided into the gth and Gth rates; the former mounting from 40 to 32 guns, and the latter from 28 to $=0.0$ The largen ot the fifth rate have two decks of cannor, the lower battery being of 18 -pounders, and that of the upper deck of 9 -pounders; but thofe of 36 and $3^{2}$ guns have nne complete deck of guns, mouning 12pounders, befises the quarter-deck and forc-cafle, which carry 6 -pounders. The complement of a Thip of 44 guns is 280 men; and that of a frizate of 36 gune, 2,40 men. The firn has three, and the fecond twn, lieutenants ; and brth have two mafter's mates, fix midfhipmen, two furgeon's mates, fix quarter-mafters and their mates, two boatfiwain's mates and one yeoman, one gunner's mate and one yeoman, with so or 11 quar-ter-gunners, and one purfer's feward.

Frigates of the 6th rate carry 9 -pounders, thofe of 28 guns having 3 -pounders on their quarter-deck, with 200 men for their complement; and thofe of 24 , 1 to men: the former has two lieutenants, the latter, one; and both have two mafter's mates, fout midfhipmes, one furgeon's mate, four quarter-maflers and their mite', one boatfwain's maie and one yeoman, one gunner's mate and one yeoman, with fix or feven quarter-gumners, and one purfer's feward.

The floops of war carry from 18 to 8 cannon, the laryeft of which have lix-pounders; and the fmall. it, viz. thote of 8 or 10 guns, four-pounders. Their officers are generally the fame as in the 6 :h rates, with little variation ; and their complements of men are from 120 to 60 , in proportion to their force or magnitude. N. B. Bomb-vefiels are on the fame eftablifhment as floops; but fire-fhips and hofpital-hips are on that of fifth rates.

Nothing more evidentls manifens the great improvement of the marine art, and the degrec of perfection to which it has arrived in Britain, than the facility of managing their firf rates; which were formerly efteemed ineapable of government, unlefs in the moll favourable wather of the fummer.

Ships of the fecond rate, and thofe of the third, which have three decks, carry their fails remark.ably well, and labour very little at fea. Tliey are excellent in a general adion, or in cannonading a lortrefs. Thofe of the third rate, which have two tiers, tre fit for the

Line rf batic, tolead the convers a and fyadrons of theps of war in acton, and in general in fuit the different exigencies of the $n$ oraliervice.

The finuth-rates may be entployed on the fime occalions as the thind-rates, and may bo alfo deftined amongel the $f$ rifn colonics, or an expeditions of great ditance; fince thefe velle!s ate wiably excellent for le-piag: ind futaning tha: feat.

Veflels of the rith rate ate tro weak to fufter the froch of a line of battie: but they may be deftined to lead the e bunys of metchant flips, to protect the comaneres in the colorics, to cruize ia different fations, to accompany lipuadions, or to be fent exprefs with necelfaty intelligence and orders. The f.ome may be obferved of lle: lixh rates.

The frigues, which mount from 28 to $3^{8}$ gins arran one deck, with the quarter-deck, are extremely fr per for catazing asamit provateers, or for fhort expeditions, beins light, lungr, and mitally excellent failors.
R.JTliEN, or Rartis, in commerce, a thick wodlien fuuf, quilled, woven on al loom with four traddles, like ferge; and other thuffs that have the whale or quilling. Theere are fome ratcens drefled and prepared like cloths; others left limply in the hair, and others where the hair or knap is frized. Rateens are chelly manufictured in l'rance, Holland, and Italy, and are inglily ufed in linings. The frize is a lort of coarfe rateen, and the druget is a rateen half limen half woollen.

RATIFICATION, an at approving of and confirming fomething done by another in our name.

KATIO, in atithmetic and geomet!y, is that relation of honugeneons things which determines the quantity of one from the quantity of another, without the intervenion of a third.

Two numbers, lincs, or quantities, $A$ and $B$, being p:opofed, their relation one to another may be confidered under une of thefe two heads: 1. How much $A$ exreeds 13 , or $B$ exceeds A : And this is found by taking $A$ from B , or B from $A$, and is called arithmetic recifin, or ratio. 2. Or how many times, and parts of a time, A contains B, or 13 contains A? And this is called giamerric reafon or ralio; (or, as Euclid defines it, it is the munal hatitule, or refper, of two magnitudes of the fame kind, according to quantity ; that is, as to low often the one contains, or is contained in, the other) ; and is found by dividing $A$ by $B$, or $B$ by A. And here note, that that quantity. which is referred to another quantity is called the antecelent of the rolio: and that to which the other is referred is called the confequem of ter ratio; as, in the ratio of $A$ to $B, A$ is the antecedent, and lis the confequent. Therefore any quanity, as antecedent, divided by any quantity as a comequent, gires the ratio of that antecedent to the confequent.

Tlus the ratio of $A$ to $B$ is $\frac{A}{B}$, but the ratio of $B$ to $A$ is $\frac{B}{A}$; and, in numbers, the ratio of 12 to + is $\frac{12}{4}=3$, or triple; but the ratio of +1012 is $\frac{4}{12}=\frac{1}{3}$, or fubtriple.

And here note, that the quantitics thus compared
mut be of the fame hind; that is, fueh as by multipli. Ratiozina. ction may be made to eaceed one the other, or as thefe quantites ane aial to h.we a ratio between them, which, being multiplied, naty be made to exced one amolher. Thus a line, how thort focver, may be gultiplied, that is, produced fo long as to exceed any given right line; and confequently thete may be compared together, and the ratio expreded: but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a fuperficies, how imall foever; thefe can therebore never be compared together, and confeybently have no ratio or refped one to another, according to quantity ; that is, as to how often the one contains, or is comained in, the other. See Quantiry.

KA'l'lOCIN.1'lON, the act of rafoning. Sce Reasoning.

RATION, or Ratian, in the army, a portion of ammanition, bread, drink, and forage, diftributed to each foldier in the army, for his daily fibbliftence, \&c. The hode have rations of hay and oats when they cannot "go out to lorage. The rations of bread are reguJated by weight. The ordinary ration of a foot foldier is a pound and a half of bread per day. 'The officershave feveral rations according to their quality and the number of attendants they are obliged to keep. When the ration is augmented on occations of rejoicing it is called a double ralizx. 'IThe fhip's crews have alto their rations or alowince of biket, pulfe, and water, proportioned according to their fleck.

RATlONALE, a folution or account of the principles of fome opinion, action, hypothefis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silcfia, and capital of a duchy of the fume name, with a cafle. It has been twice taken by the Swedes, and is feated on the river Oder, in a conntry fertile in corn and fruits, 15 miles north-caft of Troppaw, and I 42 eaft of Prague. E. Long. 22. 24 . N. Lat. 50. I 4 .

RA'ISBON, an ancient, large, rich, hanfome, and Arong city of Germany, in Bavaria, free and imperial, with : bithop's fee, whofe bithop is a prince of the empire. It is called by the Germans Regenfourg, from the river Regens , which runs under a tine fone bridge, and throws itfelf into the Danube below the city; and the rivers Luber and Nab mix with it above the city. 'l'ne French call it Ratibon, in imitation of the Litins; it hath formerly been fubject to the kings of Bavaria, who made it the place of their refidence; but it wats declared free by the emperor Frederick I. whicl dues not however, hinder the dukes of Bavariafrom dividing the toll with the citizens, according to an agreement between them. 'Ihele princes have alfothe criminal jurifdiction, for which the magiftrates of the city pay them homage. It is the lirlt city of the bench of Suabia, and contains at prefent within its walls five different free fates of the cmpire ; namcly, the bifhop, the abbot of St Emmeran, the abbeffes of the Low and High Munfter, and the city. The inhabitants of Ratifon have the privilege not to be cited before other tribunals, unlefs for actions above 400 florins. The fenate is compofed of 17 members, and there is a council of 10 , which is charged with the government of the ftate. The citzens have a right to clect a chief, who judges of the affairs of police. The catholics have the exercife of their religion in the cathedral church, and others, and

Ratines the I.utherans in three clneches, which they have built. The magiftrates and officers of the city are all Proteftants ; and it is to be remarked, that although there are
about 22 Citholic churches, yet there are very few Catholic citizens, the magiftracy not allowing the frecdom of the town to he given to Catholics living there. As this city is large, elegant, and full of magnificent houfes, it has been choten many years for the place of holding the diet, upon account of the conveniency, to many neighbouring princes and Atates of tending their provifoons by land and water, without great expence. The town-houre, in the hall of which the Diet neets, is extremely magnificent. In the year 17ifo, however, when there was a war in Germauy, the Diet met at Frankfort on the Main, till after the death of the enlperor Charles VII. Provifions are very p!entiful at Ratifon in time of peace. The inlabitants have a good deal of trade, the river on which it flands being navigable, and communicating with a great part of Germany. It is 55 miles fouth-eaft of Nuremberg, 62 north of Munich, and 195 well of Vienna. E. Long 12. 5. N. Lat. $4^{8 .} 59$.

RATLINES, or, as the failors call them ratins, thefe lines which make the ladder feps to go up the flrouds and puttocks, hence called the rallins of the fbroulds.

RATOLFZEL, a Arnng town of Germany, in Suabia, near the weft end of che lake Conftance. It is feated on the part of it called Bodinfec, and belongs to the houfe of Auftria, who took it from the duke of Wistemburg, after the battle of Nordlingen. It is 12 miles weft of the city of Confanace. It is defended by the impregnable caftle of Hohen Dwel, on an inacceffible hill in the middle of a plain, the rock of which is flint, fo that a few men may hold it out againft an army.

Rattlesnake. See Crotalus.
Ratgt.fs.anke Roof. See Polygala.
Ratzeburg, or Ratzemburg, an ancient town of Germany, in the circle of Lower S.axony, and in the duchy of Lawenburgh, with a bihop's fee and a calle. Thetown depends on the duchy of Lawenburg, and the cathedral church on that of Ratzburg. It is feated on aneminence, and almon furrounded with alake 25 miles in length and three in breadth. The Duke of Lawenburg feized and fortitied it in 1689 , and the king of Denmark took it in 1693 ; but it was difimantled, and reftored in 1700 to the Duke, who re-forified it. This town has been frequently pillaged, particularly in 1552, by Fiancis duke of Saxe Lawenburg, bec.ute the canons refufed to elect his fon Magnus their bifhop. It lies nine miles fouth of Lubec. This place is noted for its excellent beer. E. Long. 10. 58. N. Lat. 53. 47 .

RAVA, a town of Creat Poland, and capital of a palatinate of the fame name, with a fortified calte, where they keep flate prifoncrs. The houfes are built of wood, and there is a Jefuits college. It is feated in a morals covered with water, which proceeds fiom the river Rava, with which it is furrounded. It is 45 miles fouth of Blofkn, and 50 fouth-weft of Warfaw. The palatinate is bounded on the north by that of Blufko, on the call by that of Mazovia, on the fouth by that of Sandomer, and on the weft by that of Lencieza.

RAVELIN, in fortification, was anciently a fat
battion placed in the middle of a curtain; but now a detached work compofed only of two faces, which make a faliant angle withont any flanks, and raifed before the countericirp of the place. Sce Fortification.
RAVEN, in ornithology. See Cnavus.
Sea RarEN or corvo niarimo of Kongo in Africa, in ichthyology, is about fix feet long, and big in proportion ; but the moft fingular circumftance appertaining to this creature is the lione found in its he:d, to which the natives afcribe fome medicinal virtues, and the delicate tafte of its hard toc, which is aill much admired, when dried in the fun, and becomes as hard as a fone.

RAVENGLAS, a town of Cumberland in Englind, fituated between the rivers 11 ; and Eik, which:, with the fea, encompafs three parts of it. It is a we!I built place, and has a gond road for hlipping, which brings it fome tride. E. Long. O. 5. N. Lat. 54. 20.

RAVENNA (anc. geog.), a noble city of Gallia Cifpadana; a colony of Theflilians, on the Adriatic, in wafles or a boggy fituation, which proved a natural fecurity to it. The houfes were all of wood, the communication by bridges and boats, and the town hept fiveet and clean by the tides carrying away the mud aad foil, (Strabo). Ancently it had a port at the mouth of the ledelis: Auguftus added at new port, capacious to hold a neer, for the fecurity of the Adriatic, between which and the city lay the via Cixfaris. In the lower age it was the feat of the Ollrogoths, for 72 years; but being recovered by Narfes, Jaftinian's gencral, it became the refidence of the exarchs, matgiftrates fent by the emperorfrom Confantinople, for $: 75$ years, when it was taken by the Longobards. It is nill called Ravenna, capital if Romania. The feat of the weftern or Roman Empire was by Honorims tranflated to Ravenna about the ycar 404, and hence the country in which it focd was called Romania, in the pu'pe's territory. It had a very flourifning trade till the fea withdrew two miles from it, which has been a great detriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now mon remarkable for the excelicne wine produced in its ncighbourhood. The maufoleun of Theoderic is fill to be feen, remarkable for being covered by a fingle flone 28 fect in diametcr and 15 thick. It was at Ravenna that the duke of Nemours fell, after having gained a moll decifive vianty over the confederate army, in 1511. Sce Franceno 129, an.l Modern Univerf.l Hiftory, vol. xx. p. $3^{2}+$ àe.

RaVENSBURG, a county of Germany, in Wertphalia, bounded on the noth by the bithoprics of Ofnaburg and Ninden, on the call by Lemgow, on the fouth by the bifhopric of Paderborn, and on the weft by that of Munftr. It belongs to the king of Praflia, and has its name from the cafle of Ravenf: burg.

Rayensburg, a free and imperial town of Germany, in Algow, in the circle of Sunbia. It is well buit, and the pmblic frmetures are handfonie. The inhabitants are partly Protellants and partly Papifs. It is feated on the river Chenfs, in E. Long. 9. 46. N. Lat. 47. 44 .

RAVET, an infert flaped like a mav-bug, or cock chaffel, (fec Scarabieus), with which the: illand of Guadaloupe is much peftered. It has a ftining fmell, preys upon paper, books, and furniture $\mathbf{c}_{2}$ and whatever are very carcful of thefe feiders.
they to not gaw is ditcoloured by their crjure. Thefe nally inféte, which atre very numerous, and appear chictly by night, would be intolerable, were it not for a lurge spuder, fume of them as $1 . \mathrm{ng}_{\mathrm{g}}$ as at man's lift, which intangles them in its web, and velherwite liurprites them. On which account the inhabitants of the illand

RAVILIAAC (lirancis), the imfamous affalin of Homry IV. of Frmce, was a mative of Angonlefme, and at the t me ch his execution he was about one or two and thirty years al age. See lirascf, $r^{\circ} 146$, and Hleser il'. of France. Ravillise was the fon of parents who livad upon alms. His tather was that fort of inferior retainer to the law, to which the vulgar Give the name of a 1.68 eser, and his foa liad been ficulup in the lime way. R.villtiuc had fet up a clainn t) a: chate, but the cauf went againh him: this difarruiteruene atfened his mind deeply: he afterwards t.th he a fohool, and, as hime'f hiid, received charirabie gitice, though but of a very fmall value, from the preats of thole whom he taught; and yet his difrefs we:s tio great, that he hod mach ado to live. When he w.15 dized for the king's munder, he was very loofely gharded; all were permitied to fpeak with him who pleatid; and it was thought very romarkable that a Jethit thould liy to hins, "Friend, take care, whatever you do, that you don't charge honeft people." He wits rem ved 11:xt di.y from the houfe of Elpernon to the Cenciengeric, the proper priton of the parliament (I) laris. When he was firl interrogated, he anfiveled with gient boldnefs, "That he had done it, ard wonld d., it, if it were to do again." When he was told that the king, though dangeroufly woundcd, was living, and might recover, he faid that he had fltuck him home, and that he was fure he was dead. In his fubfequent examinations he owned that he had long lad an intention to kill the king, becanfe he fufdered two religions in his kitgdom; and that he enden woured to ubtain an andience of him, that he might admonifh him. He alio laid that he undertood the king's great armamen to be againtt the pope, and that, in his upinion, to make war againtt the pope, was to make var againt Gol. We hive no diltinet account of the three laft exam nations; but he is faid to have perfifted, ia tle noft foiemn alleverations, that he had no accomplices, and that nobody had perluaded him to the fact. He arpeared furpifed at nothing fo much as at the mimertal athorrence of the people, which, it feems, lee did not expect. 'they were forced to guard him llifity from his fillow-piloners, who would otherwile have mudered hain. The buthers of Patis defired to fact:m pue int their hinds, affirming that they would fisy lim alive, and that be thould till live 12 days. Whien be was put the the ture, he broke out into limbid exectations, and elways infifted that he did the dict from $h$ is own motive, and that he could accufe ardmaly. On the day of his execution, after be had made the anienite banatralle before the church of NotreD.me, he was carried to the Gieve; and, being brought upon a feaffold, was lied to a wooden engine in the thape of a St Andrew's crofs. The knife with which la diat tie mader being laftened in his right hand, it was firft burnt in a llow fire; then the flethy parts of his body " nere orn with red hot pincors, and melted lead, oit, pitch, and rofin, poured into the wounds
and through a clay funnel into his bowels by the navel. Ravilliac. The poople refufed to pray for him; and when, according to the fentence prononnced upon him, he came to be dragged to pieces by four horles, one of thote that were brought appeasing to be but weak, one of the Epestators oftered his own, with which the criminal was nuch moved: he is f.id to have then made a confellion, which was fo written by the greffier Voifin, that not io much as one word of it could ever be read. He was very carnell for abfulution, which his confeffor refufed, unlefs he would reveal his accemplices; "Give it me conditionally (faid he) ; upon condition that 1 have told the truth," which they did. Ilis body was fo robun, that it refined the force of the horfes; and the exceutioner was at lengh obliged to cut hina into quarter:, which the people dragged through the fireets. 'The loufe in which he was born was demolifhed, anch a column of inlamy erected; his father and mother were banifhed from Angoulefme, and ordered to quit the hingdom upon pain of being hanged, if they returned, without any furm of procels; his brothers, filters, uncles, and other relations, were commanded to lay afide the name of Ravilliac, and to alfume fume other. Such was the fate of this execrable monfter, who, according to his own account, fuffered himelf to be impelled to fuch a fact by the feditious fermons and books of the Jefuits, whom Henry, rather ont of fear than love, had recalled and careffed, and to whom he had bequeathed his heart.

Neither the dying words of Ravilliac, nor fo much of his procefs as was publifhed, were credited by his cotemporaries. Regalt the hiforian fays, that there were two different opinions concerning this affalination; one, that it was conduged by fome grandees, who facrificed that morarch to their old refentments; the other, that it was done by the emiffaries of the Spa. niards. Letters from Bruffels, Antwerp, Mechlin, and other places, were received before the 15 th of Maj, with a report of the king's death. Though nothing occurs in the examinations of Ravilliae that were firit publifhed, in reference to his journcys to Naples and other places ; yet as thefe are fet down as certain truths by good anthors, fo there are probable grounds to believe that they were not fictitious. It appears from Sir Ralph Winwood's Memorials, that Ravilliac had been not long before at 1 Bruffels. Amonglt other circumfances that created a very great doubt, whether the affalfin fooke truth, were the things found in his pocket at the time he was feized; amongtt which was a chaplet, the figure of a heart made in cutton, in the centre of which he foid there was a bit of the true crofs, but when cut there was none, which he affirmed was given him by a canon at Angoulefme, a picee of paper with the arms of France painted upon it, another full of characters, and at third containing verfes for the meditation of a criminal going to execution. The provolt of lluvicrs, or Petiviers, in Beauce, about fix miles from Paris, had kiid openly on the day that Henry IV. was murdered, "Ihis day the king is either Glain or dangeroufly wounted," After the king's death was known, he was feized and fent prifoner to Paris; but, before he was examined, he was fourd hanged in the ftrings of lis drawers. His body was, notwithfanding, hung up by the heels on the common gibbet on the igth of June. What increafed the fuppieions

Praun
grounded on this man's end, was his having two fons Jefuits, and his being a dependent on the family of Monfieur d'Entragues.

RAUN, upon the river Miza, a town of feme Arength, remarkable lor a bloudy firmilla between the Pruflians and Aufrians, in Aurult 1it4. The king of Pruflia, intending to get pilielion of Deraun, fent thither fix battalions, with eight cannon, and 800 huffus; but General Feltititz being tbere with a great party of his corps, and M. L.achefi with icco horfe, they not nilly appulfed the Pruilians, but attacked them in their turn, and, after a warnd cispute, obliged them to retire with conlidera ic lofs.

RAURICUM (anc. geog.), a town of the Raurici, fituated orer againft Abnoba, a mountain from which the Danube takes its rife. A Koman colony led by L. Manitius Planeus the fcl. olar and friend of Cicero: called Colomia Rauriaca (IPliny), Raurica (Infcription), Ausula Ruariorum. The town was dettroyed in Julan's time. It is now commonly called $A u g f$, a village grearly decayed from what it formerly was. It is fituated on the Rhine, diflant about two hours to the ealt of Dafil. The country is now the canton of Batil.

RAY ( $\mathrm{J}(\mathrm{ln}$ ), a celebrated botanitt, was the fon of Mr Roger Ray a blackfmith, and was born at Black Notly in Elfex in 1628. He received the firt rudiments of learning at the grammar fchool at Braintree; and in $164+$ was admitted into Catharine hall in Cambridge, from whence he afterwards removed to Trinity college in that univerlity. He took the degree of malter of arts, and became at length a fenior fellow of the col'ege; but his intemfe application to his Atudies having injured his health, he was obliged at bis leifure hours to exercife himfelf by riding or walking in the fields, which led him to the fudy of plants. He noted from Johnfon, Parkinfon, and the Phytologia Brilannica, the places where curious plants grew ; and in 1658 rode from Cambridge to the city of Cheller, from whence he went into North Wales, vifiting many places, and among others the famous bill of Snowdon; returning by Shrewfory and Gloucefler. In 16tio he fublifhed his Catulojus Plantarum circa Cantabrigian naf. centiun, and the fame year was ordained deacon and prief. In 1661 he accompanied Francis Willoughby, Eiq; and others in fearch of plants and nther natural curiofities, in the north of England and Scotland ; and the next year made a weftern tnur from Chefter, and through Wales, to Cornwall, Devonfliire, Dorfethire, Hampthire, Wilthire, and other counties. He afterwards travelled with Mr Willoughby and other genwemen through Holland, Germany, Italy, France, ©ic. took leveral tours in England, and was admitted iellow of the Royal Society. In 1672 , his intimate and beloved friend Mr Willoughby died in the 37 th year of his açe, at Middleton Hall, his feat in Yorkilhire; "to the intinite and unipeakahle lois and grief (fays Mr Ray) of myfelf, his lriends, and all good men." There having been the clo!eft and fincerell friendhip between Mr Willoughby and Mr Ray, who were nien of fimilar natures and tafles, from the time of their being felluw collegians, Mr Willonghby not only confided in Mr Ray, in his lifetime, but allo at his death: for he made him one of the executors of his will, and charged him with the education of his fon Trancis and

Voz. XVI.

Thomas, leaving him alfo for life coi. per anmors.
years of are, Mr R:yy, as a faithiful trut:, betork himeif to the inftruction of them; and for: their lif: compofed his Nomen lator Cli, 在 us, which wis pablified this very year, 1 Gi72. Tramers the eluet d'ying l.efure he was of age, the younger became Lert bialdileton. Net many months after the death of Mr Wi.luaghby, RII Ray loft another of his benf fiinde, bithop Wilhins; whom he vifited in London the atith of November 16;2, and found near expiring by al cetal fuppreflion of urine for eight days. As it is natural for the mind, when it is hurt in one part, to feet: $10-$ liefirom anuther; fo Mr Riy, having loft fome of his beft friends, and being in a manner left deftitute, cor:ceived thoughts of marriage ; and accurdingly, in Jure 1673, did actually marry a gentlewoman of aloout 20 years of age, the daughter of Mir O.2kly of Laun!on in Oxfordihire. Towards the end of this year, can:e forth his "Obfervations Topographical, Moral, «c." made in foreign countries; to which was added his Catalogus stirpium in exteris resionibus obfereatarum: and about the fame time, his ciollection of unufuel or local Engliff ecora's, which he had gathered up in his tenvels through the counties of England. After having fublifhed many books on fubjects foreign to his prefefion, he at length refolved to publith in the chariater o! : divine, as well as in that of a natural philofupher: in which view he publifhed his excellent demonfrat:on of the being and attributes of God, entitled The Wijdome of Goul manifffict in the W'rk's of the Creation, 8vo, 1697. The rudiments of this work were read in fome college leatures; and another collection of the fame kind he enlarged and publithed under the citle of Tlores Physicothoological Difcourfes, concetning the Chaos, Ddluge, aned Difolution of ibe World, $8 \mathrm{vo}, 1692$. He died in 1705. He was modeft, affable, and communicative; and was diflinguifled by his probity, charity, fobriet!, and pi:ty: He wrote a great number of works; the principal ot which, befides thofe already mentioned, are, 1. Catalogus Plantarum Anglia. 2. Disionariarum Trilingue feciundum locos communi:s. 3. Hilloria Plan:arum, Spectis, bagenus editas, alinfque infuper multas nositer invorntas et deforiptas compleciens, 3 vols. 4. Methodus Plantarum nova, cam Tabslis, 8vo, and feveral other works on plauts. 6. Syropfis Mectodica Animalium guacirupedume ser-pentini generis, 8vo. G. Symopis Metioolica Aqium net Pifcium. 7. Ififoria Inferforun, opus foflıunum. 8. Methodus Infelorum. 1. Philofophic.1] Leeters, sic.

Ray, in optics, a beam of light emitied from a raldiant or luminous body. See IIight and Oprics.

Infleded Rars, thofe rays of lighe which, on their near approach to the edges of hodies, i: falling by them, are bent out of their couric, being taitned cither frons the body or towards it. This properiy of the rays of light is generally termed diffraftion by toreignces, and 1 )r Hooke fometimes callecl it defere lion.

Refleged Rars, thofe rays of light which, after falling upon the body, do not go beyond the furface of it, but are thrown back again.
Refralted Rais, thofe rays of light which, after fall. ing upon any medium, cuter its furface, being bent cither towards or from a perpendicular to the point oswhich they tell.

Pen:if of R.ers, a number of rass illuing from the point of ath chjost, and diverging in the form of at conc.
R.1ZOR, a welloknown inftument, ufed by furfecons, bathers, EiE. for thaving off the hair liom vadious parts of the body.-As thaving to many perple is a most painful operation, cutlers in different come tries f.ave long applied their thill to rentove that inconventace. Some have invented forps of a peculiar hind to mahe cioe operation more ealy, and fome have inventod ltrap: Whith refect torazors, fome antits have fuccected rather by accident than from any fixed prir.ciple; and therelore we have found great ineyuality in the g oatuelz of razurs made by the fime artite.
$\therefore$ correfiendent anlures us, that he has for to years pait been at muly pains to find out romors made by the Weat makers bo:h in England and Scotland, and was fortunat: ernuari, abuui 22 years ago, to diliover a kind made by a soothman of the name of Lo, an, which lee calied magnetical razors, becule they were directed in be telulhed with an artificial magnet hefore uling. 'l'lefe, our friend affures us, are molt excellent vazors, and he has ufed them for upwards of 20 yeurs. He fays lokwid that they continue in good order, withont requiring to be ground; but that the great draw back en their being grenerally ufed, is the price, which is higher than mult pcople are able or difpoled to give for that ialtrument. Our correfpundent, who refides in the vicinity of London, alio informs us, that lately the tamnots furgem's inftrument-maker, Mr Savigny in l'all Mall, after numberlefs experiments, in the courfe of above 20 years, has at length brought razors to a degree of perfection never yet equalled; and with fuch certainty, that the purchater is in no danger of a difappointmert, though the price is very moderate. By theic, we are told, the operation of thaving is performed with greater cafe, more perfeetly, and more exfeditiouly, than with any other.

RE, in grammar, an ineparable particle added to the beginning of words to double or otherwife mo-dity- their meaning ; as in re-adtion, re-move, re-cxport, Sis.

RE-ACTION, in pliyfology, the refitance made hy all bodies to the action or impulfe of others that endearour to change its Aate whether of motion or re!t, \&c.

KEAlING, the art of delivering written language wi:h propricty, force, and elegance.
"We mult nut judge fis unfavourably of eloquence or good reading (fays the illuftrions Fenelon), as to reckon it only a frivulon: art, that a declamer ufes to impole upon the wak imagination of the multitude, and to ferve his own ends. It is a very ferious art, defigned to inltruct people; to fupprefs their paffions and reform their manners; to fupport the laws, direct public councils, and to make men good and happy."
belivery in Reafon and experience demonftrate, that delivery in rescing froult be 1.: animaI:d than in interefted ipeaking. roling ought to be lefs animated than in intercfat Speaking. In every excrcife of the faculty of tpeech, and thofe ex. preflions of countentuce and geeture with which it is generally : itterded, we may be confidered to be always in one of the two following lituations: Firft, delivering our lofom fentinents on circumfances which relate to ourfelves or others, or, fecondly, repeating fomething that was fpotica on a certain occafion for the amufe-
ment or information of an anditor. Now, if tre obferve the deliveries natural to thefe two fituations, we fhall find, that the firlt may be accompanied with every degree of expreffion which can manifer itlelf in us, ir m the loweft of fymporty to the moft violent and energetic of the fipperior paffions; while the latter, from the fpeakes's chief bulinefs being to repeat what he heard sith accuracy, difeneers only a fuint imitation of thofe ligns of the cmotions which we fuppafe agitated him from whom the words were firft borrowed.-The ule and necellity of this difference of manner is evident; and if we are attentive to thefe natural figns of expreffinn, we thall find them conforming with the greatcit nicety to the flighteft and moft minute morements of the breaft.

This repetition of anohen's words might be fupnofed to pafs through the month of a fecond or third perfun: and in thefe cafes, lince thoy were not ear ard eye witwelies of him who firt fpoke them, their manner of delivery would wamt the advantage nece(faril) ariling from an immaliate idea of the original one ; hence, on this accomnt, this would be a llill lefs lively reprefentation than that of the firt repater. But as, from a daily obfervation of every variety of fpeech and its afisciated digns of emotion, mankind foon berame pretty well acquainted with them, and this in different degrecs, according to their difcernment, fenlibility, 太c. experience fhows us that thefe latter repeaters (as we call them) might conceive and ufe a mamer of delivery which, though lefs charatieriflic perhaps, would on the whole be no way inferior to the firlt, as to the common natural expreffion proper for their fituation. It appears, therefore, that repeaters of every degree may be efteemed upon a level as to animation, and that our twofold diftinction above contains accurately enough the whole variety of ordinary delivery :--we faly ordinary, becaufe

There is another very peculiar kind of delivery fometimes ufed in the perfon of a repeater, of which ir will in this place be neceffary to take fome notice. What we mean here is minicry; an accomplillment which, when perfectly and properly difplayed, never fails of yielding a high degree of pleafurc. But fince this pleafure chiefly refults from the principle of imitalion refpecting manner, and not from the purport of the matter communicated ; fince, comparatively fpeaking, it is only attainable by a few perfons, and practifed only on particular occafions;-on thefe accounts it mult be refufed a place among the modes of ufeful delivery taught us by general nature, and efteemed a qualification purely anomalous.

Thefe diftinctions with regard to a fpeaker's fittortion of mind premifed, let us fee to which of them an author and his reader may moft proporly be referred, and how they are circumfanced with regard to one ancther.

The matter of all books is, either what the author fays in his own perfon, or an acknowledged recital of the words of others: hence an author may be eftecmed both an original fpeaker and a repeater, according as what he writes is of the firlt or feennd kind. Now a reader mut be fuppofed either aftually to perforate the author, or one whofe oflice is barcly to communicate what he has faid to an auditor. But in the firf of thefe fuppofitions he would, in the delivery of what is the author's own, evidently commence minic; which beine, as

## KEA

Reading.
above obfelyed, a charaetor not achnowledged by gener.l asture in this deparmment, oughtit to be rojected as generally improper. The other luppofition therefure mult be accounted right; and then, as to the quible matter of the book, $t$ e reader is found to be ceatetly in the fituation of a ropeater, fitve that he takes what he delivers from the page before him inttead of his memo. ry. It follows then, in proof of our initial propofition, that, if we are directed by nature and propriety, the manner of our delivery in reading onght to be inierior in warmth and energy to what we flould ufe, were the langu:ige beiore us the fipontareous effufions of our own hearts in the circumftances of thole cut of whofe mouths it is fu:pofed to proceed.
livident as the purport of this reafoning is, it has not fo much as been glanced at by the witers on the fubjen we are now entered upon, or any of its kindred unes; which has occalioned a manifelt want of accuracy in feveral of their rules and obfervations. Among the reff, this precept has been long reverberated from autleer to author as a perfcet ftandard for propriety in reading. "Deliver yourfelves in the firme manner you would do, were the matter your own original fentiments uttered direaly from the heart." As all hinds of delivery muft have many things in common, the rule will in many articles be undoubtedly right; but, from what has been faid above, it muft be as certainly faulty in refpect to feveral others; as it is certain nature never confounds by like figns two things fo very different, as a copy and an original, an cmanation darted immediately from the fun, and its weaker appearance in the lunar reRection.

The precepts we have to offer for improving the abovementioned rule, thall be delivered under the heads of accent, emphafis, modulation, exprefion, purues, Exc.

1. Accent. In attending to the affections of the voice when we fpeak, it is eaty to obferve, that, independent of any other confideration, one part of it differs from another, in flrefs, energy, or force of utterance. In words we find one fyllable differing from another with refpef to this mode; and in fentences one or more words as frequently vary from the rell in a fimilar manner. This ftrels with regard to follables is called wecent, and contributes greatly to the valiety and harmony of language. Relpecting words, it is termed emphafos; and its chief otlice is to aflitt the fenfe, force, or perfuicuity of the fentence-of which more under the next head.
" Accent (as deferibed in the Leefures on Elocution) is made by us two w,ys; either by dwelling lingor upen one fyllable than the reft, or by giving it it imater percnffion of the voice in utterance. Oi the firlt of thefe we have inllances in the words slory, foitler, boly; of che laft in but'tle, hab'it, lor'roce. So that ac. ceat with us is not referred to tune, but to time; to quantity, not quality; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In theatric clechamation, in order to give it more pomp and folemnity, it is uual to dwoll lourger than common upon the unaccented fyllables; and the author now quoted has endeavoured to prove ( $p .51 .5 t^{\prime}$ ) the practice fally, and to thow ( $p .55$. ) that "though it (i. e. true folemnity) may demand a flower utterince

## Ig ] R E A

than ufual, yet (it) requires what He ofnis fropertior in point of quantity be obterved in the fyliables, :as the : e is in mufical notes when the fame tree is f'is? $d:$ quicker and fower cime." Dut that this d. viation in is ordinary fpeects is rot a fault, as our autlion : ff:1:s; nay, that culle contrary it is a rall, eatuty whe: hef under proper regulation, the lollowirg obiervasi ns i: 1 , hoped wiil fufficiently prove.
(I.) It is a tiuth of the moft cbvinus nature, tise thofe things which on their application to their proper lenfes have a power of ratifing in us certain ideas and emotions, are ever differti'j molified in their couftultent parts when different effects are produced in the mind: and alfo (II.) that, within proper bounds, wete we to fuppofe thefe contlituent parts to be propostionatly increafed or diminified as to quantity, this cffed would Ptill be the lame as to quality.- Fer iattance: The dif. ferent ideas of thength, fwiftrefs, \&c. which ate raifcu in us by the fame frecies of animals, i; owing to the different form of their correfponding parts ; the vifterent effces of mufic on the paffions, to the different airs and movements of the melody; and the cifferentexprefions of human fpeech, to a difference in tone, fpecu, \&ic. of the voice. And thefe peculiar effects would fiill remain the fume, were we to fippofe the animals :tbove aliuded to, to be greatir or lefict, within their yoper bounds; the movement of the mufic quicler or jloweer. provided it did not palpably interfere with that of fornc other fpecies; and the pitch of the rnice higher or lower, if not carried out of the limits in which it is oberved on fimilar occafions naturally to move. Farther (III.) fince, refpecting tie emotions more efpecially, there are no rules to determine à priori what effect any farticular attribute or modification of an object will have upon a percipient, our knowledge of this kind mut evidently be gained from experience. Laftly, (IV.) In every art imitating nature we are pleafed to fee the characteriftic menibers of the pattern beinbtened a little farther than perhaps it ever was carried on any ral example, provided it be not bordcring upon fome ludicrous and difigrecable provinces of exceis.

Now for the application of thefe premilles.-T'o keep pace and be confltent with the dignity of the tragic mufe, the delivery of her language thould neceliatily be dignified ; and this it is plain from obfervation (I.) car!not be accomplifhed otherwife than by lomething difierent in the manner of it from that of oruinatry fpect! ; lince dignity is effentially different from fomiliarity. But how mult we difover this different manne: ? Byatten!! ing to nature : and in this cafc the tells us, that befides ufing a focvir delivery, and greater difinarief, of tle e words (uhich every thing mercly graze requires, ind gravity is a contomitant of dignity, thulugh notits eff(n:c), we muft diedl a little loneer upon the macentel fyllatbles than we do in common. As to what our au:her obferves in the above quotation, of dis inty's only recpu:ring a Joater utterance than ordinary, while the proportion of the fyll.bbles as to quantity continues the fame; it is apprehended the remart (II.) refpefing quickrefs and fo:crifs of movement, will thow it tu be not altogether true. For fince the delivery is not al. tered in form, its exprefion mult be llill of the fame kind, and perhaps what mily be rightly fuggefted by the tern grovely familiar.

## k E A

But fumething farther may be yet faid in defe ce of this artificial dehery, as our author calls it. Is not the movenatat of any thing, of whatever fpeceic, when dignificd or fulem, in general of an eqwa! le and driterate nature (as in the ninuet, the militiry Itep, \&e.) ? And in: theatric.al declamation, is not the propenity to introduce this cisarblenefs io ftrong, that it is almort imsort.e to avoid it wholly, were we ever to determined to do it ? If thefe two queries be anfwered in the affirnative (as we are pariuided ther will), while the firt fupports cur argument tor the prsfriety of the manner of delivery in quettion, the fecond dificovers a kind of neceffiry for it . And that this manner may be carried a little farther in quaatity on the fage than is ufual in rara! life, the principle (IV.) of heightening nature will juttity, provided fathion (which has ever fomething to do in thele articles) give it a fanction; for the precte quanity of fereral heightenimgs may be varied by this gieat legiflator almoftat will.
II. Empligfis. As cmplafis is not a thing annexed to particular words, as acciont is to fyllables, but owes its rife chefly to the meaning of a palfige, and mult therefure vary its feat according as that meaning varies, it will be neceflary to explain a little farther the general idat given of it above,

> Of man's firf difobedience, and the fruit
> Of that forbidden tree, whofe mortal talte
> Brought death into the world, and all our woe, \&cc. Sing heav'nly mufe, \&c.

Suppofing, in reference to the above well-known lines, that originally other beings, befides men, had difobeyed the commands of the Almighty, and that the circumftance were well known to us, there would fall an emphafis upon the word man's in the fint line, and hence it would be read thus ;

Of man's firt difobedience, and the fruit, scc.
But if it were a notorious truth, that mankind had tranfgreffed in a peculiar manner more than once, the emphafis would fall on firff, and the line be read,

Of man's frif difobedience, \&e.
Again, admitting death (as was really the cafe) to

20 R R E A
have been an nabeard-of and dreadful punifthment Reading. brought upon man in confequence of his tranfgrefion; on that fuppolition the third line would be read,

Brought diath into the world, see.
But if we were to fuppofe mankind knew there was fuch an evil as death in other regions, though the place they inhabited lad been free from it till their tranfgreftion; the line would run thus,

Brought death into the quor'd, sec.
Now from a proper delivery of the above lines, with regard to any one of the lippofitions we have cholen, out of feveral others that might in the fame manner have been imagined, it will appear that the emphofis they iflultrate is effected by a manifett delay in the promanciation, and at tone fonsthing fuller and louder than is ufed in ordinary; and that its office is fulely to determine the meaning of a fentence with reference to fomething faid betore, prefuppofed by the author as general knowledge, or in order to remove an ambiguity where a pallage is capable of having more fenfes given it than one.

But, fuppofing in the above example, that none of the fenfes there pointed out were precifely the true one, and that the meaning of the lines were no other than what is obviouly fuggefled by their fimple conflruction; in that cate it may be afked, if in reading them there fhould be no word dignified with the emphatical accompanyments above defcribed :- The anfwer is, Not one with an emphafis of the fame kind as that we have jult been illuftrating; yet it is neverthelefs true, that on hearing thefe lines well read, we fhall find fome words diftinguifhed from the relt by a manner of delivery bordering a little upon it (A). And thefe words will in general be fuch as feem the molt important in the fentence, or on other accounts to merit this diftinction. But as at beit it only enforces, graces, or enlivens, and not fixes the meaning of any palfage, and even eaprice and falhion (в) have often a hand in determining its place and magnitude, it cannot properly be reckoned an effenial of delivery. However, it is of too much moment to be neglected by thofe who wrould wilh to be good readers ; and, for the fake of diftinction, we may not
(s) The following lines will illu\{trate both thefe kinds of Areffes: For, to convey their right meaning, the rord anv is evidently to be pronounced louder and fuller than thofe with the accents over them. Get wéalth and pláce, if penlible with gráce; If not, by any meáns get weath and pláce. Pope.
This eouplet is aecented in the manner we find it in the EJIy on Elocution by Mafon. And if, aecording to the judgment of this author, the words thus difinguifhed are to have an emphatical frefs, it mult be of the inferior kind abovementioned, and which a little farther on we call cmphafis of force; while the word anv in a different type alune pollefles the other fort of energy, and which is there contradittingufted by the term emphafis of fenfe.
(is) A mong a number of people who have had proper opportunities of learning to read in the beft manner it is now taught, it would be difficilt in find two, who, in a given initance, would ufe the emphofis of foree alike, cither as tu place or quantity. Niry fome fearce ufe any at all : and others will not feruple to earry it much beyond any thing we have a precedent fur in common difeonfe; and even now and then throw it upon words fo very triftiry in themfelves, that it is evident they do it with no othor view, than for the fake of the variety it grives to the modnlation. - This prastice, like the introdution of difcords into mufic, may witheut doubt be indu'ged row and then; but were it too frequent, the capital intert of thefe energies would manifefly either be dettroyed or rendered dubions.
$\underbrace{\text { Keading. }}$ $\underbrace{(N)}$ not unaptly denominate both the kinds of energies in queftion, by the terms cmptriyis of fonfe, and cmplafis of force (c).

Now from the above account of thefe two fpecies of emphatis it will appear, " that in reading, as in feaking, the firlt of them muft be determined entirely by the fenfe of the paffige, and always made alike: But as to the other, tafle alone fecms to have a right of fixing its fituation and quantity."-lrather : Since the more elfential of thefe two energies is filely the work of nature (as anpears by its being conflantly found in the common conserfation of people of all kinds of capacities and degrees of knowledge), and the moft ignorant perfon never fails of ufing it right!y in the cffulions of his own heart, it happens very luekily, and ought always to be remembered, that provided we undertiand what we read, and give way to the dictates of our own feling, the emphafis of fonfe can fearce ever avoid falling fontaneoully upon its proper place.

Here it will be necefliary to lay fomething by way of reply to a queltion which will naturally necur to the mind of every one. As the rule for the emphifis of fenfe requires we thould underltand what we read before it can be properl) ufed, is it incumbent upon us never to attempt to read what we have not previcully fludied for that purpofe ? In anfwer to this, it mut be obferved, that though fuch a ftep will not be without its advantiges; yer, as from the fairnefs of printed types, the well-known paufes of punctuation, and a long acquaintance with the phrafeology and confruction of our language, \&c. experience tells us it is poffible to comprehend the fenfe at the firft reading, a previous perufal of what is to be read does not feem neceflary to all, though, if they would wilh to appear to advantage, it may be expedient to many; and it is this circumitance
which makes us venture upon extemporary reading, and give it a place among our amufements.-Similar remarks might be made with regard to modulation, expref. fion, \&c. did not what is here obferved naturally anticipate them.

IIT. Moclulaticn (D). Every perfon mut have obier- Modula. ved, thar, in Speaking, the voice is subject in an altera- tiou. tion of found, which in fome meafure sefembles the movement of a tunc. Thefe founds, however, are evidently rothing like fo much varied as thofe that are fhityly mufical ; and we have attempted to fhow in the preceding chapter, that, belides this, they have an effential difference in themfelves. Neverthe.efs, from the general fimilitude of thefe two atticles, they pofficis feveral ternis in common; and the particuar we have now to examine is in both of them called modulation. This affection of the voice, being totally arbitrary, is differently characterized in different parts of the world ; and, through the power of cuftom, every phace is inclined to think their own the only one natural and agrecabie, and the reft affected with fome barbarous twang or unfeemly variation ( E ). It may be obferved, however, that though there is a general uniform calt or fathion of modulation peculiar to every country, yet it by no means follows, that there is or can be any thing fixed in its application to particnlar paffiges ; and thercfore we find different people will, in any given infance, ufe modulations fonething different, and neverthelefs be each of them equally agreeable.

But, quitting thefe general remarks, we fhall (as our purpofe requires it) confider the properties of modulation a little more minutels.

Firf, then, we may obferve, that, in fpeaking, there is a particular found (or key-note, as it is often called) in which the modulation for the moft part runs, and in which
(c) The firft of thefe terms anfwers to the fimple emphafis defcribed in the Zeefures on Eloculion, and the ficcond nearly to what is there called complex. The difference lies in this. Under complex emphanfis the author feems (for he is far from being clear in this article) to include the tones fimply confidered of all the emotions of the mind; as well the render and languid, as the forcible and cauling. Our term is intended to be confined to fuch modes of expreflion alonc as are marked with an apparent firefs or increafe of the voice.
(D) The author of the IntroduEion to the Art of Reading, not allowing that there is any variation of tone, as to bigh and !ow, in the delivery of a complete period or fentence, places modulation folely in the diverfification of the key-note and the varicty of fyllables, as to long or fort, fruift or four, frong or revenk, and loud or foft. As we are of a diffcrent opinion, our idea of modulation is confined purely to barmonious inflexians of voice. Thefe qualities of word, it is true, add greatly both to the force and beanty of delivery; yet, fince fome of them are fixed and not arbitrary (as long and flort), and the others (of fwift and flow, flrong and weeak, loud and fofi), may be conlidered as modes of exprellion which do not affect the modulation as to tore, it will agree beft with our plan to efeem thefe properties as refpectively belonging to the eftablilhed l.aws of promuniation and the imitative branch of expreffion mentioned in the end of the enfuing head.
(E) From what accomnts we have remaining of the modulation of the ancients, it appears to have been highly ormamented, and apparently fomething not unlike our modern recitative; particularly that of their theatric declamation was mufic in the ftrifelt fenfe, and accompanied with inftruments. In the courfe of time and the piogrefs of refinement, this modulation become gradually more and mere fimple, till it has now lof the genins of mufic, and is entirely regulated by tatte. At home here, every one has heard the fing-fong cant, as it is called, of

## Ti ti dum dum, ti ti dum ti dum de,

Ti dum ti dum, ti dum ti dum dum de;
which, theugh difgulful now to all but mere ruftics on account of its being out of faftion, was very pro. bably the favourite modulation in which heroic verfes were recited by our aneeftors. So flusiuating are the tafte and practices of mankind! But whether the power of language over the pafions has receiscd any advantage from the change jult mentioncd, will appear at leaft very doubtful, when we reculleat the ltories of its former triumphs, and the inherent charms of mufical feunds.
rッ1inz． いーバ
muy in iome refpeits be conce ved to have a refersice， like that which commen matic lats to its key－note． Iet thare is this dfference between the two kinds of ra whation，that whesen，thec tirll always concludes in the K．s－note，the other frequently corcludes a little telow it（r）．＇lais ke）－mote，in fpeahing，is generally the found gisen at the nutien of eruy complete En－ tone er pariud：and i：maj le cblerved nn fome veca－ linus to vary its fich thons the dimits of a mutical jutersill ef a conlid．rable mashitude．The tones，thit tal a litt！e lower that the kicy at the ciole of afentence wr perio＇，ate calld canemes．Thele calences，il we are accurate in our diftinctions，will，with ref cef to their nfices，be found of two linds；though they meet in ficytand；$t$ gether，that it may be bett on enaceive thein only as mivering a double purpo．e．One of thefe effices is to atlit the lomle，ard the other to decorate the modu＇aticn．In account of the firlt maty be feen int the fextion on Pates；and the latter will be found 1．）How itfe！pretly tietuenty in ceory thing grave ard plairtive，or in poetic delciption and ot？cer hemly ornamented languare，wherc the mind is by its intlu－ ence brouglit to feel a placid hind of dignity and f．tis－ faction．Thefe two cadences，therefore，may be con－ venimaly dithmpuiflad by applying to them refpective－ ly the epiheis fignfican and ornamentul．

IV：have already obferved，that reading fhould in fome things differ from fpaking ；and the particular under contideration feems to be one which ought to va－ r）a little in thete arts．For，

Modulation in teading dirves a ：wofold purpofe．At the fane time that it gives pleafure to the ear on the pinciples of larmony，it contributes through that me． diura to preferve the attention．And fince written lan－ suage（\％hen not purely dramatical）is in general more clegant in its conflruction，and mulical in its periods， than the oral one ；and fince many interciting particu－ lars are watiting in seading，which are prefent in fpeak－ ing，that contibute greatly to fix the regard of the licarer；it feems reafonable，in order to do juftice to the language，and in part to fupply the incitements of at－ tention jut alluded to，that in the former of thefe two articles a modulation mould be uled fomething more liarmonious and artificial than in the latter．Agreeably to this reatoning，it is believed，we thall find every rea－ der，on a narrow examination，adopt more or lefs a mo－ dalation thus ornamented：though，after all，it muft be actinow！edged there are better grounds to believe，that the practice has been hitherto direeted intuitively by nature，than hat it was difesvered by the inductions of reafon．We thall conclude this head with a rule for mo－ dulation in reading．＂In cvery thing dramatic，collo－ quial，or of fimple narrative，let your modulation be the lame as in focaking；but when the fubject is flowery， lolemm，or dignificd，add fomething to its harmony，
diverlify the key－n te，and increafe the frequency of Reading cadences in propotion to the merit of the compofs tion．＂

It will readily be feen，that the procep：s here drawn from a conprotion between fpeaking ind reading， wonld be very inadequate，were they left dentitute of the alliftance of $f$ afle，and the opportun ty of fierueraly learires and insitwines maghery realers．And indecd， （1）theic twa great ausilimies we might very properly howe rffermed the whole matter at once，as capabie of giving finficient directions，had we not rencmbered that our plan requised us to found feveral of our rules as much on the principles of a philolophical analyfis， is on thofe more bamilise ones which will be fund of greater efficacy in real practice．

IV．Expreftin．1．There is no compofition in mufic，Expreflion however perted as to key and melody，but，in mder as to the to do jultice to the dibject and iveas of the author， will requisc，in the performing，fomething more than an exat adlicrence to turec and time．This fomething is of a nature，ton，which perhaps can never be ade－ quaticly pomted out by any thing graphic，and refults entirely from the tatte and feeling of the performer： It is that which chicfly gives mutic its power over the pafions，and characterifes its notes with what we mean by the words fued，larifb，dul，livel＇，flamive，joy－ ous，\＆e．lor it is evident every lound，confidered ab． ftractedly，without any regard to the movement，or high and low，may be thus modified．In praclical mulic， this commanding particular is called Expreffor：and as we find certain tones analogous to it frequently coar－ lefcing with the modulation of the voice，which indi－ cate our pallions and affections（thereby more particu－ lasly pointing out the meaning of what we lay），the term is uftally applied in the dame fenfe to fpeaking and reading．
＇Thefe tones are not altogether pcculiar to man．－ Escry animal，that is not dumb，has a power of ma－ king feveral of thens．And from their being able，un－ affilted by words，to manifett and raife their kindred emotions，they conftitute a kind of language of them－ felves．In the limguage of the harart matn is eminently converfant ；for we not only underlland it in one ano． ther，but alfo in many of the inferior creatures fubject－ ed by providence to our fervice．

The expreflion here illuftrated is one of the mont ef－ fential articles in good reading，fince it not only gives a finifing to the fenfe，but，on the principles of fympa－ thy and antipathy，has alfo a peculiar eflicacy in inte－ relling the heant．It is likewife an article of molt dif． ficult attainment；as it appears from what follows，that a mafterly seader ought not only to be able to incor－ porate it with the modulation properly as to quality， but in any degrec as to quantity．

Every thing written being a proper imitation of fpeech，exprellive reding nufl oceafonally partate of
（r）As muficil founds have alw：tys an harmonical reference to a key or fundamental note，and to which the mind is fill fecretly attending，no picee of mufic would appear perfect，that did not clofe in it，and fo naturally put an chd to expectation．But as the tones ufed in feechare mot mulical，and therefore cammet refer harino－ nitally to any other found，there can be no neceflity that this terminating lound（and which we immediately be． low term the cadence）thould cither be ufed at all，or follow any paticulat hwas to form，Ec．farther than what so impoled by tafle and cultom．

## R E $A$

$\underbrace{\text { Readiug. }}$
all its tones. Bnt from what was faid above, of the difference between reading and fpeaking, it follows, that th:fe figns of the emotions thould be lefs Arongly characterifed in the former article than in the latter. Again, as feveral of thefe tones of espreffion are in themfelves agrecable to the mind, and raife in us agreeable emotions (as thofe of pily, bencerolence, or whatever indicates liappinefs, and gooduefs of heart), and others difagrecable (as thofe of a loiflerons, malevolent, and depraved nature, \&c.) it farther appear:, fince reading is an art improving and not imi ating nature, that, in whatever degree we abate the exprellions of the tones above alluded to in the firf cale, it would be eligible to m.ke a greater abatement in the latter. liut as to the quantities and proportional magnitudes of thefe abatements, they, like many other particulars of the fame nature, mut be lelt folely to the safle and juderment of the reader.

To add one more renark, which may be of fervice on more accounts than in fuggefting anther reafon for the donarine above. Let it be remembered, that thu' in order to acquit himfelf agreeably in this anticle of expreffion, it will be neceffary every reader thould fial his fubject as well as underfland it; yet, that he may preferve a proper eafe and malterlinefs of delivery, it is alfo necellary he fhould guard againft difiovering too much emntion and perturbation.

From this reafoning we deduce the following rule, for the tones which indicate the paffions and emotions.
"In reading, let all your tones of expreffion be berrowed from thofe of common fpeech, but fomething more faindly characterifed. Let thofe tones which fignify any diliagrecable pafion of the mind, be fill more faint than thofe which indicate their contrary; and preferve yourfelf io far from being affected with the lubjeet, as to be able to proceed through it with that peculiar kind of eafe and nafterlinefs, which has its charms in this as well as every other art."

We fhall conclude this fection with the following obfervation, which relates to fpeaking as well as reading. When words fall in our way, whofe "founds feem an echo to the fenfe," asfouirr, liuzz, bumt, ratte, bifs, jar, \&c. we ought not to pronnunce them in fuch a aranner as to heighten the imitation, except in light and ludicrous fubjects. For intlance, they fhould not in any other cafe be founded fquir.r.r-buzz. $\approx . z-h$ hum,m.mr.r.ralle, \&e. On the contrary, when the imitation lies in the moverment, or fow and flructure of a auhole pafCage (which frequenty happens in poetry), the delivery may always be allowed to give a heighicning to it with the greatelt propriety; as in the following inflances, out of a number more which every experienced reader will quickly recollect.

In thefe decp folitudes and awful cells,
Where heav'nly-penfive Contemflution davells, And ever-mufing Melancholy rcigns-

2. Befides the particular tones and modificati-ns of Expyrefinn voice above defcribed, which allways acompany and as to the expiefs our inward agitations, nature has in thefe cafes fa e e and endowed us with another language, which, inllead of befure. the ear, addrecles itfelf to the ele, thereby giving the communications of the heart a double advantage over thefe of the underfanding, and us a double clanese to preferve fo ineitimalle a blelling. This language is what arifes from the different, almolt incoluntary novements and conlguratiors of the face and bndy in our cmotions and partions, and which, like that of tones, every one is tormed to underfand by a kind of intuition.

When men are in any violent agitation of mind, this cooperating expreffion (as it is called) of face and grefture is very itrongls marked, and rotally free from the mixture of any thing which has a regard to gracefulnefs, or what appearance they may make in the eyes of others. But in ordinary convelfation, and wheie the emotions are not fowarm, faflionable people are perpetudlly infinuating, into their countenance and action, whatever they imagine will add to the eafe and elegance of their deportment, or impref's on the fpeetitor an idea of their amiablenefs and breeding. Now, though the abovementioned natural organical figns of the emotions fhould accompany every thing fpoken, yet from what was obferved in the introduciory part of this article (like the tones we have joft treated upon), they fhould in reading be much lefs frongly expreffed, and thole fuffer the greatelt diminution that are in themfelves the moftungainly. And as it was in the laft fection recommended to the reader to preferve himfelf as far from being affected in all paffionate fubjects as to be able to keepatemperate command over the various affections of the voice, \&c. fo under the fanction of this fubordinate feeling he may accompany his delivery more frequently with any cafy adion or change of fac:, which will contribute to fet off his manner, and make it agreeable on the principles of art.

As theie calm decorations of aetion (as we may call them) are not altogether natural, but have their rife from a kind of inltitution, they muft be modelled by the pratices of the polite. And though mankind differ from one another fearee more in ally particular than in that of taleuts for adopting the graceful actions of the budy, and herce nothing determinate can be faid of their nature and frequericy, yet even thofe, moft happily calculated to acquit themfelves well in their ufe, might prosit by confidering that it is better grcatly to abridge the difplay, than to over-do it ever fo little. For the peculiar modefty of deportment with which the tmon amiable charaters are endowed, minkes them in common endeavour to fupprefs many figus of an agitated mind; and in fuch cafes the bodily ones in particular are very fpaingls ufed. They have alfo a natural and rooted difilik to any kind of affeation; and to no
fpecies,

Ppecies, that ere can recoilen, a greater, than to that which is feen in a ferton who pretends to mimicry .and en whty geflure, withont polfilling the advantages and tolents they require ; and of which not many poople, compataively tpeating, have any remakible thare.

The inference of this is to cbrious to need drawing out, and we we uld particulaty recommend it to $41^{\circ} \mathrm{c}$ cumideruion of thofe reaticrs who thenk the comm on - conerence of a newfaper, ic. cannot be properly delivered without as o d de.l cliblw-runm.

Ahhme ${ }^{\text {h }}$ it is impalible to come to particuiars in any directio ns of this hind, yet there is one anticle of our pre ent fubjex on whi ha fervice.ble remak may he now le. In ordinary diferurte, when we are particu'arly prefing and canctl in what we fay, the eye is noturally thre whinn the: to whom we adret's onrfives: Aad in reading, at tha of this organ now and then upmen the heare:s, when any thing icry remarkabl: of intercfing falls in the waly, 1 as a gocd cftect in gaining it is froper attentien, sic. Dut this thonla Tout be two frequently ufed; for if fi, Leflues its having a tendency to confound the natural importance of dittocent pail. ges, it may not be altogether agreeable to fome to have their own reffestons braken in upon by a fignal, which might be interpreted to hime at their wather regulation.

Orec obfervation more, and then we fhall attempt to recapituldte the tubllance of this fcetion in the form If a precept. Though it is, when ftictly examined, inconfitent, both in fpeaking and reading, to imitate with antion what we ate defcrbing, yet as in any thing comic fich a prasuice may furgeft ideas that will acoord with thofe of the fulject, it may there be now and then indulged in eilher of thefe articles.
"In a mamer fimilar to that direfied with regard to tones, moderate yrur bodily expreffion of the figns of the emotions. And in order to fupply, as it were, this deficiency; introduce into your carriage fuch an cafy gracefulnefs, as may the confifent with your acquirements in thefe particulars, ard the neceffary dread which fould ever be prefent of falling into any kind of affefation or grimace."
V. Paufes. Speech confifting of a fucceffion of difine words, mut naturally be liable (botls from a kind of accident, and a difficulty there may be in beginning certain founds or portions of phrafes immediately on the ending of certain others) to feveral fmall intermilions of wice; of whieh, as they can have no meaning, nothing farther need here be find. There are, lowever, fome paufes, which the fenie neceltarily demands; and to thele the fubftance of this festion is direfted.

The paufes are in part to diftinguith the members of fentences from one another, the terminations of comphete periols, and to atlord an opportunity for taking breath. belides this, they have a very graceful effect in the modulation, on the fame account they are fo effential in mulie. - In both arricles, like blank fpaces in piftures, they fer ofl :and render more confpicuous whathover they cinjoin or terminate.

Were langlage made up of nothing bit fhort colloqui.ll fentences, thefe paufes, though they might do no h.irm, and would generally be graceful, would howerer be fuporicued as to whe by the completenets and mer$r$ ranef, as we may fay, of the meaniag. But in more d.ffuse language, compofed of feveral detached fertences, and which require fome dergree of attention in order to take in the fenfe, the intermiliens of voice under confideration are of the greatelt fervice, by fignifying to the mind the progrdis and completion of the whule paflige. Now, though in extenfive and differently formed periods there may be menbers whofe completenefs of fenfo might be conccived of various degrees, and hence might feem to requ:ire a fet of paufes etqually numerons; yet, fince the fenfe does not altogether depend upon thefe intermifions, and their rathos to one another, if capable of being properly defined, conld not be accurately obferved, grammarians have ventured to conceive the whole clafs of paufes as reducible to the four or five kinds now in ufe, and whofe marks and ratios are well knowa (c); prefuming thal under the eye of tafte; and with the affillance of a particular to be next mentioned, they would not fail in all cafes to fuggeft intermifions of voice fuitable to the fenfe. But in many of thefe extenfive and complex periods, sounded with a kind of redundancy of matter, where the full fenfe is long fufpended, and tie final words are not very important, there would be fome hazard of a mifapprehenfion of the termination, had we not more evident and infallible notice of it than that which is given by the paufe. This notice is the cadince, referred to in the fection on Modulation; which, as is there cbferved, befides the ornamental variety it affords, appaars from thefe remarks to be a very neceflary and ferviceable article in perfpicuous delivery.

As this cadence ra'urally accompanies the end of every entirc fenfe, cireumftanced as abovementioned, it may fometimes fall before the fenicolon, but more generally before the color, as well as the period: For thefe marks are often found to terminate a complete fenfe; and in thefecafes, the relation what follows has to what went before, is figrificd to the mind by the relative florthefs of the fop, and the form of introdincing the additional matter. Nor can any bad confe
quence
(c) Suppofing the comma (,) one time, the femicolon (;) will be two ; the colons (:) three, and the period (.) as alfo thic marks of intcrrogation (!) and admiration (!) four of thefe times. The blank line ( - or $-\cdots$ ), and the Lreal's between paragrafhs, intimate fill greater times; and by the fame analogy may be reck med a double and quadruple peried refpectively. Now and then thefe blank lines are placed immediately afore the ordinary points, and then they are conceived only as feparating for the eje the different natures of the matter;-as a guedtion from an anfwer,-precept from example,-premifes from inferences, \&c. in whicl, cafe their import is evident. But of late fome authors have not ferupled to confound thefe diftinctions; and to make a blank ferve for all the paufes univerfally, or the mark of an indefinite refl, the quantity of which is left to the determination of the reader's talte. A practice, it is imagined, too deftruative of che intended precilion of thefe typical notices to be much lenger adopted.

## R E A

Teading.
quence arife from thus founding diftintions on ratios of time, which it may be faid are toa nice to be offen righty hit upon: for if a confufion fhoul: harpea between that of the colons and period, there is perhaps fo trifing, a difference between the nature of the palfiges they fuecced, as to make a fmall inaccuracy of no confequence. And as to the relts of the femienion and period, it will not be eafy to millake aboui them, as their ratio is that of two to one. Add to this the power which the matter and introduction of the fubfequent pallages have to renify any dight error bere made, and tie flall be fully fatisfied, that the piufes as ufually explained, with the cadence above defcribed, and a proper knowledge of the language, will convey fulficient information to the undertanding of the co:fruative nature of the paffiges atter which they are found.

It may be obferved, that in natural fpeech, according to the warmth and agitation of the fpe:aker, the relts are often thortand injudicioully proportioned, and lience that every thing thus delivered cannot be fo graceful as it might have been from a proper attention to their magnitude and effers.

Paufes then, though chiefly fubjected to the ferfe, are, as was renauked at the cutfet, ferviceable in beautifying the modulation, sec.-And fince bnoks, are often inaccurately printed as to points, and people's taltes differ fome litile about their place and value, it appears, that, "although in reading great attention thould be paid to the llops, yet a greater thould be given to the fenfe, and their correfpondent times occafionally lengthened beyond what is uital in common fpeech ;" which obfervation contains all that we fhall pretend to lay down by way of rule for the managcment of paufes in the delivery of written language.

As there are two or three fpecies of writing, which have fomething fingular in them, and with regard to the manner in which they fhould be read, a few parsicular remarks feem neceflarily required, we thall conclude this article with laying them before the reader:
3. Of Plays, and fuch like conversation-pieces. Writings of this kind may be confidered as intended for t:wo different purpoles ; one to unfold fubjeat matter for the exercife of theatric puwers; and the other to convey amufement, merely as lable repletc with pleafing incidents and characterific manners. Hence there appears to be great latiude for the difplay of a conj,ffent delivery of thef: pertormances: for while, on one hand, a good reader of very inferior talents for minicry may be heard with a tolerable degree of pleature; on the other, if any perfon is qualified to give a higher degree of life and force to the dialorue and charaters by delivering them as an actor, he mult be fully at liberts to fart fiom the confinement of a chair to a poflure and area more fuited to his abilities; and, it he be no: deceived in himfelf, his hearers will be confiderable gainers by the changc.The next article is,
2. Sermons orother orations, which in like manner may be conceived intended for a double purpofe. Firf, as matter for the difplay of oratorical powers; and, fecondly, as perfinalive difenurfes, sic. which may be read like any other bnok. Therefore it appears (for seafons timilar to thote abore) that accordinys as clergymen are poffelfed of the talents of clocution, they may confifently either rehearic their fermons, in the Vol. XVI.

25 J R E A
manacr of an extemporary baraufue, or deliver them R.adine in ha more hamble capacity of une vilo is comtent to entertain and inftust his heerers i.ith reading to them his own or fome other perfon's witten ciliould.

Tiat cither of thefe manners of delivery (or a mix. ture of them), in either of the caff:s abovenentic.net, is arrecable, we finat on a carcful examimation. Ir r this will thow us how frequently they run into nne atnotiser ; and that we are fo far from thinking fuch tranfitions wrong, that, without a particular atteation that way, we fearce ever perceive them at all.
3. Poetry is the next and lalt cluje of of our prefent retnarks. This is a very poculiar kind of writing,and as much diferent from the language of ordinary difcourfe as the movements of the dance are frem common walking. To ornament and improve whatever is fubfervient to the pleafures:and amufements of life, is the delight o: human nature. We are alfo pleafed wih a lind of excefs in any thing which has a power to amufe we fancy, infpire us with enthutisfm, or awaken the foul to: confcioufi:efs of its own importance and dignity. Hence one p!cafure, at leaft, takes its rife, that we fecl in contemplating the performances of every art ; ard hence the language of poetry, confifting of a meafured ryihmats, harmonious cadences, and an elevated pinturefque diction, has been Rudiad by the ingenious, and found to have a powerful inflaence nver the human breaft is every age and region. There is fuch an affinity beween this language and mufic, that they were inthe earlier ages never leparated; and thougli modern refineme:it has in a great meafure defroyed this union, yet it is with fome degree of difficulty in rehe.rfing thefe divine compofitions we can forget the finging of the mufe.

From the fe confiderations (and fome hindred ones mentioned in fect. iii.) in repeating verfes, they are gencrally accompanied with a modulation rather more ornamented and mufical than is ufed in any other hind o? writing. And accordingly, as there feems to be the greatelt propriety in the practice, the rule for this particular in the festion juft referred to, will allow any latitude in it that can gain the fanction of tafte and pleature.

Rhymes in the lighter and more foothing provinces of poetry are found to have.a good cffect ; and hence (for reafons like thofe juft fuggented) it is certainly ablurd to endeavour to frocther them by a feeble pronunciation, and running one line precipitately into another, as is often affceted to be done by many of our modern rcaders and feakers. By this method they not only deflroy one fource of pletfiure intended by the ecm. pofer (which though not great is neverthelut' genuine), but even ofen fupply its place with what is really difagrecable, by making the rhymes, as they are interrupt. edly perceived, appear accidental blemidties of a difierent Ayle, ariling from an unmeaning recurrence of fimilar founds. With regard then to reading verfesterminated with thyme, the common rule, which direats to pronounce the final words full, and to dillinguith them by a fight paufe even where there is nons required by the fenfe, feems the molt rational, and confequently nioit worthy, of being followed. Sce Declamation, Narration, and Oratory.

Reanisg, a town of Berkthire in England, pleafantly feated on the river Kenneth, near the confluence with the Thames. It had once a fine tilh monaftery, of which there are large ruins remaining. It had alfo it

## KEA | 2h J REA

Featire: calic buith by king Hemy I. but it was afterwards level!ed with the ground. It is a corpuration, enjoys feveral privileses, and fends two members to parliment. The :wo navig.able rivers render it a fit place for tade. IV. Long. 1.O. N. Lat 5 : 25.

Reading, a poftown of lennflwania, and capital of Berks county; fituated on the N. E.. fide of the river sichuylkill. It is regulaly laid out, and contains alout 1,o houles, a fone jail, court-houfe, a church for Germ.m Lutherans, one for Calvinills, one for Quahers, and one $i, r$ R $\rightarrow$ man Catholics : alfo a large buildag for the rublic offices. It is chicfly iuh.dsited by Gernans. This town is remarkable for tice manufachure of wool hat's, which is carried on largely by individuals. Contignens to the cown is a remarkable spring, which is the hundred feet fquare, and to feet deep, with a ftream of water iffuing from it large enough to turn a reill, and affording an abundance of fifh : the water is cicar and tranfparent. A court of quarter feffinns and common pleas is held here the frif Morday in Jannary, April, and November. It is $5+$ miles N. W. of Philddelphis. W. Lout. 75. 54. N. Lat. fo. 21.

READINGS, or Farious Reainngs, in citicifm, are the different manner of seading the texts of authors in ancient manuferifts, where a diverfity has arifen from the corruption of time, or the ignorance of copyifts. A great part of the tufinefs of crities lies in fettling the readings by confionting the rarinus readings of the feveral manuicripts, and conlidering the agreement of the words and fenfe.

Revings are alfo ufed fer a fort of commentary or glofs on a law, text, palfage, or the like, to thow the fenfe an author takes it in, and the application he conceives to be made of it.

RE-AGGRAVATION, in the Romifh scclefiaftieal haw, the laft monitory, publifhed after three admo1.itions, and before the laft excommunication. Before they proceed to fulminate the laft excommunication, they publith an aggravation, and a re-aggravation. Fevret obferves, that in France the minifer is not allowed to come to re-aggravation, without the permiffion of the hiflhop or official, as well as that of the lay-judge. See Eacommuncatiox.

REAL (Cafar Vichard de St), a polite French witer, fon of a counfellor to the fonate of Chamberry in Savny. He came young to France, difinguifhed !imifelfat Paris by feveral ingenious productions, and rificed there a long time without title or dignity, intent upon litertry purfuits. He died at Chamberry in 1692 , advanced in years, though not in circumftances. He was a inan of great parts and penetration, a lover if th: iciences, and particularly fond of hifory. A completcectition of his works was printed at Paris, in 3 vols $+14,8+5$, and another in 6 vols 12 mo .

Ralal Pref ace. Se Transubstantiation.
REALGAR. See Chemistey, no 1279.
REDLIIY, in the fehools, a diminutive of res, " thine," firt ufed by the Scotifts, to denote a thing whinhmaly ex'fe fiffelf; or which has a full and abfo. luce leing of itfelf, and is not confidered as a pait of ally orlicer.

REA IM, a country which gives its head or governer the denomination of a king.

RE-ANIM $\backslash T I O N$ means the reviving or reftoring to Life thole who are apparently dead. Sudden death is
dreaded by every human being, and it is one of thofe evils againf which the Church of England prays in her litany. Accidents, however, cannot always be prevented; but, after they have happened, it is often poffible to prevent their effects. This, by the eftablifhment of what with great propriety has been called the $/ / s$ mane: Society, has been abundantly proved: for, in the courfe of 12 years immediately after their inflitution, they were the means of faving the lives of 850 perfons, who otherwife would in all human probability have been loft to the community. Since that period, they have faved many more; and various perfons, in different conntrics of the world, by following their dircetions, have done the fame. To preferve one human loing from premature death, we mult confider as of the ntmolt confequence both as citizens and Chriftians; how much more the prefervation of thoufands. It appears from the writings of Doctors Mend, Winflow, Bruhier, Fothergill, Haller, Lecat, Tiffot, Van Engelen, Gummer, and others, that they had prepared the way for infieutions fimilar to the Humane Society: for in their works they have elucidated the principles on which they gn, and furnified directions for the practice they favour. See Dr.arh, Premature Intirment, and Droivning.

REAR, a term frequen-ly ufed in compofition, to denote fomething behind, or backwards, in refject of another; in oppofition to van.
$R_{\text {EAR }}$ of an ARAsr, fignifies, in general, the hindermoft part of an army, battalion, regiment, or fquadron; alfo the ground behind either.

ReAR-Guard, is that body of an army which marches after the main-body; for the march of an army is always compofed of an advance-guard, a main-boly, and a rear-guard: the firft and laft commanded by a general. 'The old grand-guists of the camp always form the rear-guard of the army, and are to fee that every thing come fafe to the new camp.

REAR Half-fles, are the three hindmof ranks of the battalion, when it is drawn up fix deep:

Rear-Line, of an army encamped, is always 1200 fcet at leaft from the centre line ; both of which run parallel to the front line, as alfo to the referve.

Rear-Rank, is the laft rank of a batalion, when drawn up, and generally 16 or 18 feet from the centreline when drawn in open order.

REASON, a faculy or power of the mind, whereby it diftinguifles good from evil, truth from fallchood. See Metaphysics.

REASONiNG, ratincination, the exercife of that faculty of the mind called reafon; or it is an act or operation of the mind, deducing fome unknown propofition from other previous ones that are evident and known. See Logic, Part Ill.

REAUMUR (Rene Antoine Ferchanlt, Sicur de), a perfon diflinguifhed for his laberinus refearches into natural knowledge, was born at Ruchelle in 1683 , of a family belonging to the law. Afier having finifhel his early fudies in the place of his birth, he began a ceurfe of Philofophy at Poiters, and of civil law at Jourges; but foon relinquifhed the latter, to apply himflt, according to his tafte, to mathematics, phy fics, and natural hiftory. Being come to Paris, he was reccived into the Academy of Sciences in 1708. From that hour the was wholly employed in natwal hifory, to which his inclination

## R E A

Reamur. clination particularly led him, and his inquiries were not $\sim$ confined to any one part of it. Ilis memoirs, his obfervations, his difcoveries on the formation of thells, fpiders, mufcles, the marine flea, the berry which aff reds the purple culour, and ou the caule of the mumbretis of the torpedo, excited the curicfity of the public, and early procured our authr the characher of an able, curious, and entertaining natural f . Filled with zeal for the welfare and advantage of fociety, and the prougrefs and perlection of arts, he endeavoured in all his refearches to promote the public groad. We were in éebsed to him lor the difcovely of the Turquois mines in Langucdoc. $\mathrm{H}=$ alio found out a fubitance, which is ufed io give falfe nones: cclour, which is obtained

- See Fe -
lon, 314 .; and dicnH2atis Zoology, vol. iii.
work contains a defcription of valt numbers of caterpiilirs, moths, gall infects, flies with two and four win:gi, lady-uirds, and thofe ephemeron tlies which live orly in that fornia few hours; and lattly, of thote fingular and womderful infects which are called polyree, which baing cut into feveral pieces, caclı tisce lives, grows, and bje. comes an inf: a , and affords io nur eyes a great number of prodisics*. The worl's of M. de Reamur are exaf, curious, interefting, and very ingenious. They are written with much candour, clearnets, and elenance; but it mult be acknowledged his manner is fomewhat too dit:fute. But we matt not deccive the reader; he often raifes our expectations, ani does not five u.s all the fatistaction we promite curfelves from his writinss. His method of raifing poul:ry, in particular, rather difippaints us. He fpared ncither care, time, nor expence, to render it practicable: he fattered himfelf and his countrymen with the greatell hepas; but notwithitanding his alliduous induftry, and valt charges, it proved abortive. The l.ute M. l'Advocat recommended him t. obtain better information frem Esfpt on the fubje? ; and if pollible to procure a perfon verfed in the art to inftuct him in it ; but his deuth prevented the completion of the fcheme. If the native of Egypt had arrived, flowed M. de Reaumar a better method than his own, and prastifed it with fuccefs, as in his coutitry , the community would have been benefied; on the: other hand he would have feen, had it failed, that th: climate of France was not proper for fuch experiments. M. Maillet, conful at Cairo, to whom Monfieur the regent had written to obtain the art, offered to fend over a native of Egypt, if the government would pay the expence of his voyage, and allow him a penfion of 1500 livres. M. Maillet rightly judged, when he preferred this method of proceeding. N. de Reaumar was not ignorant of the delign; but he flattered himfelf, that his efforts would be fuccefsful without further aid, and thought he fhould acquire fome honeur. He certainly had great talents, induftry, 「agacity, and every other requilite which are neceffary in fuch attempts; but it is morally impoffible that a ingle man, in a different climate, can attain fuch knowledge in an art as chofe who live in a more favourable country, and have liad the experience of many ages to profit by: however M. de Reauniur may have been unfucceffful, polterity is i::debted to him for his repeated trials. He has removed fome difficultics in the road, and thofe that iravel it may difcover what he only faw at a diflance.

REAUMURIA, it botany: A genus of the pentagynia order, belonging to the peatandria clats of planes; and in the natural method ranking under the $13^{\text {th o o der, Suculenta. The calyx is hexaphyllous, and }}$ there are five petals; the capfule is unilocular, quinçuevalved, and polyfpermon:.

REBATE, or Rebatement, in commerce, a term mucla ufed at Amfterdam for an abatement in the price ot feveral commodities, when the buyer, infead uf taking time, advances ready moncy.

Rebatement, in haraldry, a diminution or abatement, of the bearings in a coat of armis. See Abate. ment.

REBELEION, Reselio, annng the Romans, was where there who had beer. furmerly overenme in batthe, and yiclded to cheir fubjeation, ma de a fecond refi.tance: but in Eng! wad it is generally ufed for the taking
$\mathrm{REB} \quad[2 \mathrm{~S}$
 tural tubjeds, or others when once fubdued; and the word roth is fometimes :apphid to him who wifuily breaks al lise ; alfo to a vil.cin difiberying his lurd.
there is a drerence between encmies and rabels. E-- - - 'is ate thote who an . ut of the hing's allegnance: terchirs fubjeqs of the hing, either in open watr, or reheli, 1 , are not the king's enemies but traitors. And 1) wid lrance wi Whe; who heved war agant Edw. I. I ceatif: le was withen the alle itance of the king, had ientenic pronvinced againft him at a trator and rebel. livate promen may am themelves to tupplets rebels, cl:aruies, sic.

REBELLIOLS Assmabze, is a grthering toge. Rher of twelveperions or mote, intending or going abant to punfe or put in ufe ualawilly, of their own :unthaty, any that to changs the law or fatutes of the realm ; or to dellroy the iaclofures of any ground, or tantis of any mint.pond, pool, $u$ conduit, to the intent the lame alall hie watte and void; or to deflroy the dect ia any [ark, or any warren of conies, dove-houtes, or fith in ponds; or any houfe, barns, mills, or bays; or to burn dacks of com; or abite rents, or prices of vint: 1s, \&c.

KL:BC'S, an enisnatical reprefentation of fome name, \&ic. by ufing figures or pietures initead of words, or gatis of words. Camden mentions an inflance of this : Litad kind of wit in a gallatit who expreffed his love to at woman named Rofe Ifill, by painting in the borcier of his gown a rofe, a hill, an cye, a loal, and a well; which, in the fylce of the rebus, reads, "R-fe Hill $I$ lowe sucll." This kind of wit was long practifed by the great, who took the pains to find devices for their names. It was, however, happily ridiculed by Ben Johnfon, in the humourous defeription of Abel Dug:ser's device in the Alchemitt ; by the Spectator, in the device of Jack of Newberry; at which time the rebus, being ralfed to fign-pofts, was grown out of fathion at court.

Rebus is alfo ufed by the chemical writers fometimes to fignify four milk, and fometimes for what they call the ultimate matter of which all hodies are compofed.

Rebus, in heraldry, at coat of arms which bears an allufion to the name of the perfon; as three caftes, for Calleton; three cups, for Butler; three conies, for Conilby; a kind of bearings which are of great antiquity.

REBUTTER (from the Fr. bonter i. e. repelere, to put back or bar), is the anfiwer of delendant to plaintiff's furrejoinder ; and plaintiff's anfwer to the rebutter is called a furrebuter: but it is very rare the partics go io far in pleading.

Rebuter is allo where a man by decd or fine grants to warranty :ny land or hereditament to another; and the perfon making the warranty, or his heir, fues him to whom the watrimty is made, or his heir or affignec, for the fume thing; if he who is fo fued play the deed or fine with wartanty, and pray judgnont, if the plaintiff thill be received to denand the thing which he ought to warrant to the party againt the warranty in the deed, \&e, this is called : rebutter. And if I grant to a tenant to hold without inpe:chment of walle, and afterwards implead him for watte done, he may debar me of this adiun by fhewing my grant, which is a rebutter.

RECAPITCLATION, is a funmary, or a con. cite and trament enmmeration of the principal things infilled on in the preceding difcourfe, whercby the force of the whole is cullefted imto one view. Sice Orators,

RECELPT, or Rectit, in commacre, an acquittanes, o: dfelarge, in writing, intimating that the pariy has icesived : certain fum of money, either in full for the whole debt, or in part, or on ascount.

RECLIDER, in preumatics, a glafs veffel for conthining the thing on which an experiment in the air. pump is to be made.
liecenver, receplor or receptator, in Englifh law, is commonly undertood in at bad fenfe, and ufed for fuch as knowingly reccive folengoods from thieves, and conceal them. This crime is felony, and the punillment is tranfportation for $1+$ years.

RECENSIO was an account taken by the cenfers, every luftrum, of all the Roman feople. It was a general furvey, at which the equites as well as the rett of the people, were to appear. Nuw names were now put upon thic cenfor's lift, and old ones cancelled. The recenfio, in fhot, wis a more folemn and accurate fore of probatio, ard anfreed the purpofe of a revicw, by fhowing who were fit for military fervice.

RECEPTACULUN, in botany, ne of the feven parts of fruelification, defined by Linnæus to be the bafe which comeets of fupports the other parts.

Recfitaculc's Chyli, ur Pecquet's R.jervatory, the refervoir or receptacle for the chyle, fituated in theleft fide of the upper vertebra of the loins, under the aorta and the veffels of the left kidncy.

RECHABITES, a kind of religious order among the ancient Jews, inftituted by Jonadab the fon of Rechab, compreherding only his own family and poterity. Their founder preferibed them three things: firl, not to drink any wine ; fecondly, not to build any houfes, but to dwell in tents; and thirdly, not to fow any corn, or plant vines.

The Rechabites obferved thefe rules with great Aristnefs, as appears from Jer. xxxy. 6. \&c. Whence St Jerome, in his $3^{\text {th }}$ epiftle to Paulinus calls them morachi, monks, Jonadab, their founder, lived under Jehoafh, king of Judah, contemporary with Jehu king of 1 frael; his father Rechab, from whom his poterity were denominated defeer ded from Raguel or Jethro, father-inlaw to Moles, who was a Kente, or of the race of Ken: whence Kenite and Rechabite are ufed as fynonymous in Scripture.

RECLIEA't', in hunting, a leffon which the huntiman plays on the horn, when the hounds have loft their game, to call them back from purfuing a counter icent.

RECIPE, in medicine, a prefeription, or remedy, to be taken by a patient : fo called bec.mife always beginning with the word recipe, i. e. take; which is gencrally denoted by the abbreviathre Bo.

RECIPROCAL, in general, fomething that is mutual, or which is returned equally on both lides, or that :uffe?ts both parties alikc.

Recipkocal Tems, anong logicians, are thofe which have the lime lignification ; and confeguently are convertible, or may be ufed for each other.

Reciprocal, in :nathematics, is applied to quanti-

Rcciprocal tics which multiplied together produce unity. Thus $\underbrace{\text { Kecelufe. }} \frac{1}{x}$ and $x, y$ and $\frac{1}{y}$, are reciprocal quantities. Likewife $\frac{1}{1}$ is faid to be the reciprocal of $x$, which is again the reciprocal of $\frac{1}{x}$.

Rectrrocal Fizures, in geometry, thofe which hitve the antecedents and confequents of the rame ratio ia both tigures.

Rectrrocal I'ropertion, is when in four numbers the fourth is lefs than the feenned by fo much as the thiral is greater than thic firft, and wice verfi. Sce Proportion and Arithmetic, ciad. vi. Gieat ule is made of this reciprocal proportion by Sir If.activewton and others, in demonilrating the laws of motion.

RECITAL, in law, means che relearlat or making mention in : deed or writiag of warathing which has been done before.

RECITATIVO, or Rrcirarive, in natic, a hind of tinging, that differs but little from ordinary pronunciation; fuch as that in which the feveral parts of the liturgy are reliearfed in cathedrals; or that wherein the adors commonly deliver themelves at the theatre or the opera, when they are to exprefs fime action or pation; to relate fomcevent ; or reve.ll fome detign.

RECLENHAUSEN, a Atong town of Cologne, in Germany, in the midule territory of that name. The abbefs of its nunnery has power of penifhing offenders with death, and fhe alone is obliged to the vow of chattity.

RECIKONING, or a Ship's Recronisg, in navigation, is that account whereby at any time it may be known where the fhip is, and on what ccurfe or courfes The is to fteer, itio order to gain lier port; and that account taken from the lng-board is called the dead recioning. See Narigation.

RECLAiming, or Reclaming, in the ancient cuftoms, a lord's puriuing, proiecuting, and recalling, his valkl. who had gonc to live in another place without his pernu.Ifion.

Reclaiming is alfo ufed for the demanding of a perfon, or thing, to be delivered up to the prince or flate to which it properly belongs : when, by any irregular mean:, it is ce me nto unuther's poffelion.

Reclaimivg, infalcomry, is caming at hawk, se. and making her ge itle and tanaitiar.

A partridge is faid to reclaim, when the calls her young ones i gether, upon their fattering too much frem her.

RECLINATION of a plane in dialling. See - Dialiong.

RECLUSE, among the Papifts, a perfon thut up in a fmall cell of an hernitage, or monalfery, and cut off, not only from all converfition with the world but even with the houfe. This is a kind of voluntary imprifonment, from a motive either of devotion or penance.

The word is alfo applied to incontinent wives, whonn their hufands procure to be thus kept in perpetual im. prifonment in fome religious houfe.

Reclufes were anciently very numerous. They took an oath never to ftir nut of their retreat: and having entered it, the bifhop fer his feal upon the door; and the reclufe was to hive every thing necelfary for the lupport of life conveyed to him throigh a window. If
winas a prieft, he was alowed a fmail osatery, with a window, which lookal into the elnirah, through which he might make bis offenings at the mat's, hear the finging, and anfwer thofe who fonke to him; but this winduw had curtains before it, in that he could net be feen. He was allowed a litule garden, aujeinieng io his ce!l, in whicl: he might plane a few herbs, and breathe a litt!e freth air. It he liad difciples, their cells were contignous to his, with only at window of commanication, thru.' Which they conseyal necellaries to him, and received his infructions. If a reclufe fell fick, 1 is door mighe be opened for perfons to come in and affitt !eim, but he limfe!f was not to Rir out.

RECOGNITLON, in liw, an acknowledgement; : word particularly ufed in the law-books for the lirf chapter of the fattute I J.ic. I. by which the parli:1ment acknowled gal, that, after the death of grueen Elifibeth, the crown hatid rightiully defeended to king Jume.

RECOGNIZ,ANCE, i: law, is an obligation of record, whith a man eniers inco before fome court of record or magill ra:e duiy authocifed, with condition to do fome particular aft ; as to appear at the allizes, to keep the peace, to pary a debt, or the like. It is in mit refieats like another bond: the difference bsing chiefly this, that the bond is the creation of a frefh debt or obligation de nosio, the recognizance is an ackinowledyement of a former lebt upon record; the form whereof is, "that A. 13. doth acknowledge to owe to our lord the king, to the plaintiff, to C. D. or the like, the fum of ten pounds," with condition to be void on performance of the thing nipulated: in which cafe the king, the plaintiff, C.D. \&c. is called the engnizce, is cui coynofciiur ; as he that enters into the recognizance is called the cognizor, is qui cognofit, This being certified to, or takien by the officer of fome court, is witneffed only by the record of that court, and not by the party's feal: fo that it is not in frict propriety a deed, though the effects of it are gieater than a common obligation; being allowed a prionity in point of payment, and binding the lands of the cognizor from the time of enrolment on rccord.

RECOIL, or Rebound, the farting backward of a fire-arm after an explofion. Merfennus tells us, that at cannon 12 fect in length, weighing $6 ; 00 \mathrm{lb}$. gives a ball of 24 lb . an uniform velocity of 6 to feet per fecond. Putting, therefore, $\mathrm{W}=6 \neq 0, \varepsilon^{\circ}=1+, \mathrm{V}=$ $6+0$, and $v=$ the velocity with which the cannon recoils; we thall have (becaufe the momentums of the cannon and ball are equal) $\mathrm{W} v=s v \mathrm{~V}$; and fo $v=\frac{\varepsilon v \mathrm{~V}}{\mathrm{~W}}=$ $\frac{2+\times 6+}{6+00}=2,+$; that is, it would recoil at the rate of $2 \frac{1}{1}$ feet per fecond, if free to move.

RECOLLECTION, a mode of thinking, by which ideas fought after by the mind are found and brought to view.

RECONNOITRE, in military afiairs, implics to view and examine the fatc of things in order to make a report thereof.

Parties ordered to reconnoitre are to obferve the country and the enemy; to renark the routes, conveniences, and isconveniences of the firit; the pofition, march, or forcss of the fecond. In either cafe, they should have an expert gengrapher, capable of taking
plans.

## R E C

plans readily : lie frould be the beit mounted of the w ole, in ate the enem! hippen to fcatiol the efcorte, tha he may lu\% his works and indeas. Sice War.

1:LLOR1), at atuthemic tettmony in vating, contheed in wois ol phellmen:, and pleferved in a court of record. Sic Courr.

Traz! ly Racove, a fipcies of trial which is ufed mily in che particular intlance: and that is where a matiar of secom is pleaded in any atton, ats a fiue, a juclgment, or the like; and the oppofice purty pleads, rall tiel recorl, that there is mo foch matter of record exillines. Upoin this, illue is tendered and joinad in the thlowing tom, "and this he prates may be inquired If by the record, and the other doih the like;" and lacreapon the paty pleading the record has a day given lim to being it in, ind pruclamation is made in court in him $0^{\circ}$. bring forth the record by him in pleading all: fid, or eqie he thall be comdemed;" and, on his failure, his antagenill !!all havo judgment to recover. 'lhe tial, theretoe, of this ifite, is merely by the record: for, a, Sir Lidward Coke obferves, a record or enrolnicut is a mumment of io high at mature, and inmpatcth in ittelf fuch aboluse vetity, that it it be plead. ed that there is no fiech record, it thall not reccive any thial by witneti, jury, or atherwite, but only by itfelf. 'Ihus titles at mobility, is ribecher earl or not eirl, bilzotl or wot baron, thall be tried by the king's writ or paient only, which is mater of record. Alfo in cafe if an alien, whether alien friend orenemy, thall te tried by the league or treaty between his fovereign and ours; for every laggue or treaty is of record. And alto, whether a manor be held in ancient demefne or not, 1'hall be tried by the record of domerday in the king's exchequer.

IEECORDER, a perfon whom the mayor and ather masillates of a city or corporation affociate to then, for their better direction in matters of juftice :nd procecdings in law ; on which account this perfon is generally a counfllor, or other perion well killed in the law.
'rhe recorder of London is chofen by the lord mayir and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and cettities the city-cultoms. See Lovmon, $n^{\circ} 38$.

RECOVEIRY, or Common Recorenx, in Englifh law, at fyecies of alfurance by matter of record ; concerning the origian of which it mult be remarked, that common recorcries were invented by the ecclefalites to clude the llatutes of mortmain (fee Tash) ; and afterviards encouratged by the lineffe of the cousts of law in $1=$ Ldward 1 V. in order to put an end to all fettered inheritances, and bar not onl; eltates-tail, but alfo all remainders and revertions expectant thereon. We lave leere, therefore, enly to ecnlider, firf, the nature of a conmon recovery; and, fecondly, its force and effect.
Hackn.
Conament. tual or fistitious: and in it the lands are recovered agaialt the tenant of the lieehold; which recovery, being a fuppofed abjudication of the right, binds all perfons, and vells a free and ablolute iec-fimple in the recoverer. 'Lo explain this as clearly and concifely as polible, let us, in the firlt place, luppofe David Edwards to be tenant of the frechold, and defrous to fuffer a common recovery, in order to bar all cutai!s, remain-
ders, and reverfions, and to convey the fame in fee fimple, Recovery. to lrancis Golding. 'lo elfert this, Golding is to britig an action againlt him for the lands; and he accordingly tues out a writ called a pracipe quod reduat, lecaufe thefe were ats initial or molt opetative words when the lawprocecdings were in Latin. In this writ the demandant Golding alleges, that the delendant Elwards (here called the tenant) has no legal title to t?:e land; but that he came into prif:fion of it after one Hugh IInnt had turned the demandant ont of it. The fulsequent procecdings atre made up into a record or recovery roll, in which the writ and complaint of the demandant are firt recied: whereupen the tenant appeats, and calls up in one Jacob Morland, who is fuppotis, at the osigraal purchate, to have warranted the title to the tenamt; and thereupon he prays, that the faid Jacob Morland may be called in to defond the title which lee fo warranted. "This is called the soost!er, "vocatio," or calling of Jacob Morland to warranty ; and Morland is called the voucher. Upon this Jacob Morland, the vouchec, appears, is impleaded, and defends the title. Whereupon Gulding the demandant defires leave of the court to imparl, or confer with the vouchee in private ; which is (as uftal) allowed him. And foon afterwands the demandant Golding returns to court ; but Morland the vouchee difappcars, or makes delault. Whercupon judgment is given for the demandant Golding, now cail. ed the recoverer, to recover the lands in queltion again』 the tenant Edwards, who is now the recoverec: and Ldwards has judgment to recover of Jacob Morland lands of equal value, in recompenfe for the lands fo warranted by him, and now loft by his default; which is agreeable to the doetrine of warranty mentioned in the preceding chapter. This is called the recomponfe, or recovery in va!ue. But Jacob Morland having no lands of his own, being ufually the crier of the conrt, who, from being frequently thus vouched, is cilled the common vouchec, it is plain that Edwards has ouly a nominal recompenfe for the lands fo recovered agrainft him by Golding; which lands are now abrolutels velted in the filid recoverer by judgment of law, and feifin thereof is delivered by the theriff of the cunnty. So that this collufive recovery operates merely in th: nature of a conveyance in fec-fimple, from Edw:rds the tonant in tail to Golding the purchafer.

The recovery here defcribed, is with a fingle vousher only ; but fometimes it is with a double, treble, or farther voucher, as the exigency of the cafe maly require. Ard indeed it is now nfual always whare a recovery with double voucher at the lealt : by firlt conveying an eftate of freehold to any indifferent perfon, againt whom the procipe is brought; and then he vouches the tenant in tail, who vouches over the common vouclice. For, if a recovery be had immediately againtt tenant in tail, it bars only fuch eftate in the premifes of which he is then actually feifed; whereas if the recovery be lad agraint another perfon, and the tenant in tail he vouch. ed, it bears every latent right and interen which he may have in the limds recovered. If Edwards therefore be tenant of the frcelold in poffeftion, and John Barker be tenant in tail in remainder, here Edurards doth lirft vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the laft perfon vouched, and always males defauit; whereby the demandant Golding recovers the land againtt the tenant

Edwards

Recovery. Edwards, and Edwards recovers a recompenfe of equal value againt Barker the firt vouchee; who recovers the like again Morland the common vouchee, againी whom fuch ideal recovery in value is always ultimately awarded.

This fuppofed recompenfe in value is the reafon why the iffue in tail is held to be barred by a common recovery. For, if the recoveree thould obtain a recompenfe in lands from the enmmon rouchee (which there is a pollibility in contemplation of law, though a very improbable one, of his doing), thefe lands would fupply the place of thofe fo recovered from him by collufion, and would defcend to the iflue in tail. The reafon will alfo holl 1 with equal force as to mon remaindermen and reverfioners, to whon the poffibility will remain and revert, as a fuil reconepenfe for the reality which they were otherwife entisled to: but it will not always hold; and therefore, $2 s$ Pigott fays, he judges lave been cven afoti, in inventing other reafuns to mantann the authoity of recoverics. And, in particular, it hath been faid, that though the eftate-tail is gone from the recovcrec; yet it is not de!loyed, but only transferred, and nill fubfits; and will ever continue to fubfit (by confruction of law) in the recoveror, his heirs and afligns: and as the eflate-tail fo enntinues to fubfilt for ever, the remainders or reverions expectant on the determination of fuch eftate-tail can never take place.

To fuch aukward fhifts, fuch fubtile refinements, and fuch frange reafoning, were our anceftors obliged to have recourfe, in order to get the better of that nubborn ftatute de donis. The delign for which thefe contrivances were fet on foot, was certainly laudable; the unrivetting the fetters of eftates-tail, which were attended wi:1 a legion of mifchicfs to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of juftice have indeed adopred a more manly way of treating the fubject ; by conlidering common recoveries in no other light than as the formal mode of conveyance by which tenant in tail is enabled to aliene his lands. But, fince the ill confequences of fettered inheritances are now generally feen and allowed, and of courfe the utility and expedience of fetting them at liberty are apparent, it hath often been withed that the procefs of this conveyance was thortened, and rendered lefs fubject to nicesties, by either totally repcaling the nature de doris; which perhaps, by revising the old doarine of conditional fees, might give birth to many litigations: or by velling in every tenant in tail, of full age, the fame abfolute fec-fimple at once, which now he may obtain whenever he pleaties, by the collutive fition of a common recuvery; though this might pullibly bear hard upon thofe in remainder or reverfion, by abridging the chances they would otherwife frequently have, as no recovery can be fuffered in the intervals between term and term, which fornctime continue for near five months together: or, lally, hy empowering the tenant in tail to bar the eftate-tail by a folemn deed, to be made in term-time, and curolled in fome coust of record; which is liable to neither of the other objeations, and is warsanted not only by the ufage of our Amcrican colunies, but by the precedent of the flatute 21 Jac. I. c. 19. which, in the cale of a bnnkrupt tenant in tail, empowers his commifioners to fell the eflate at any time, by deed indented and enrolled. And if, in fo rational
a concern, the emoluments of the officers conecrned in Recovery, pating recoveries are thought to be worthy attention, Recremest thofe might be provided for in the fees to be paid upon cach erirol:ment.
2. The force and effert of common recoveries may appear, from what has been faid, to be an ablolute bar not only of all eftates tail, hut of remainders and reverfions expedant on the determination of fuch eftateSo that a tenant in tail may, by this mothnd of affisrance, convey the lands held in tail th the recoverer, his heirs and alligns, abfolutely frec and difcharged of all conditions and limitations in tail, and of all remainders and reverfiens. But, by fatute 34 \& 35 H . VItI. c. 20. no recovery had agsinft tename in tail of the king's gift, whercof the remainder or reverfion is in the king, fhall bar fuch eftate tail, or the remainder or teverlion of the crown. And by the flature is H. VIt. c. 20. no woman, atier her fuibind's death, thall fuffer a recovery of lands fettled on her by her hubind, or fettled on her humand and her by any of his anceftors. And by fatute 1+Eliz. c. 8. no tenant for life, of any fort, can fuffer a recovery fo as to bind them in remainder or reverfion. For which reaf, on, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is defirons to futfer a valid recovery, cither he, or the tenant to the precife by him made, mull vouch the remainder-man in tail, otherwife the recovery is void: but if he dees vouch fuch remainder-man, and be appears and vonches the common vouchec, $i$ i is then gnod; for if a man be vouched and appears, and fuffers the recovery to be had, it is as effectual to bar the eftate-tail as if he himfelf were the recoveree.

In all recoveries, it is neceflary that the recoveree, or tenant to the precipe, as he is ufually called, be actually feifed of the Ireehold, elfe the recovery is void. For all actions to recover the feifin of lands mult be brought againt the actual tenant of the freelold, elfe the fuit will lofe its effeet; fince the frceholl cannot be recovered of him who has it not. And, though thefe recoveries are in themfelves fallulous and fintitious, yet it is neceffary that theze be afores falutie properly qualified. But the nicety thought by fome mindern practitioners to be requifite in conveying the legal free. hold, in order to make a good tenant to the presife, is removed by the provifinns of the datuie $t+$ Geo. II. c. 20. which cnacts, with a retrofpect and conforinity to the antient rule of law, that, though the legal freehold be velled in leffees, yet thofe who are entitled to the next freelold ellate in remainder, or reverfion, may make a good tenant to the precipe; and that, though the deed or fine which creates fuch tenant b: fubfequent to the judgment of recovery, yct if it be in the fame term, the recovery fhall be valid in law : and that though the recovery itfelf do not appear to be entered, or be not regularly entercd on record, yet the decd to make a tenant to the pracife, and declane the ufes of the recovery, fhall after a poffellion of 20 years be fufficient evidence on behalio of a purchafer for valuablo confideration, that fuch recovery was duly fuffered.

Recovery of perfons drowned, or apparently dead. See Kr-animatins, and the artiles there referred to.

RECREANT, Cowarmiy, Fuint.bearled; formerly a word very reproachful. See Battle.

RECREMENT, in chemiltry, fome fuperfluous matter feparated from fome other that is ufful; in which

RECIUM, in anatomy, the third and laft of the large inteftines or guts. See $\Lambda$ мatoas, $n^{\circ} 93$.
RECTUS, in anatomy a name common to feveral pairs of raufl:s, fo called on account of the תraightnefs of their fibres.

RECUPERATORES, among the R-mane, were commiffoners appointed to take cognizance of private matters in difpute, between the fri'jefts of the thate and foreigners, and to take care that the former had jufice done them. It came at lalt to be ufed for commilioners, to whom the prator referred the determ:nation of any afmir betacen one fubject and another.

RECURRENTS, in anatomy, a mame given to feveral large brancles of nerves fent out by the par vagum from the upper pant of the thorax to the hirnx.

RECL゙RVIROSTRA, in ornithology; a genus belonging to the order of gralle of Iinaw, and that of palmipedes of Pennamt and Latham. The bill is long, fubulated, bent back, tharp and flexible at the point. The fect are webbed, and furnifhed with three toes forwards, and afhort one bel:ind. Mr Latham notes of this genus three fpecies, viz. the Avofetta, or the one commonly known, the Americana, and the Allua. This laft, it is probable has fome affinity to the Americana. The recurviroftravofetta is about the fize of a lapwing in body, but has very long legs. The fubfance of the bill is foft, and almof membranous at its tip; it is thin, weak, fender, comprelled horizontally, and incapable of defence or effort. Thefe birds are variegated with black and white, and during the winter are frequent on the eaftern fhores of Great Britair. They vifit alfo the Severn, and fometimes the pools of Shropfhire. They feed on worms and infęts, which they fcoop out of the fand with their bills. They lay two eggs, white, with a greenifh hue, and large fpots of black; thefe eggs are about the fize of a pigeon's.They are found alfo in tarious parts of the continent of Europe, in Ruffia, Deamarik, and Sweden, but they are not numerous. They are aifo fomad in Siberia, hut oftener about the falt lakes of tie Chartarian defert, and about the Cafpian fea. They are found likerrife on the coaft of Picardy in France in April and November, and at Orleans, but rarels. In breeding-lime they are very plentiful on the coalts of Bas Poictou. They do not appear to wander farther fouth in Europe than Italy. Whether from timidity or addels, the avofet thuns fnares, and is not carily take:1. 'The American avofet is rather larger and longer than the laft. The bill is fimilar, and its colour black : the forehead is durky white: the hend, noek, and upper part of the brealt, are of a deep cream-colour : the lower parts of the neck behind white: the back is black, and the under parts from the brealt pure white: the wings are partly black, partly white, and partly afh-coloured. Thele birds inhabit North America, and were found by Dampier in Shark's Bay, on the coalt of New Holland. Sce llate CCCCXXXV.

The recurviroftra, or folopax allua, is about i4 inclies and a quarter long, its culour white, the inferior coverts of its wings dukill, its bill orange, its lcgs brown. Edwards remarks, that the bill of this bird is bent upwards, as in the avofet; its bill black at the tip, and orange the reft of its length; all the plunage is white,

Mr Bruce has mace many cbervations on ilis f:.., which are worlhy of notice.-With regard to the rame, he firys it was costainly derived froni Edom or Efau the fon of Jacob; though in another plaee he liys, l. 2 wonders that whiters have not rather fippoted is it hiwe grot the epithet of Red, from the colour of ti. fand on its coalts, than for cther reations they have theleged. With regard to any reducts in the water itful, or in the bottom, which fime have afferted, our trave!. ler affures us that there is unfuch ching. It is more di:ficult to allign a reafon for the Hebrew name of it, which lignities the Sea if lifeds; as he never fiew a wed thronghout the whele extent of it. " Indeed, (tays he) upon the flighteft confideration, it will cocur in any cre, that anatrow gniph, under the manedia: influence of the menfuons, blowing trem contrary poil ts fix menths cath jear, would have too much agitation to produce fuch vegctables, fildom found bat in flagnant waters, and feldom, if ever, found in fillt once. My opinion then is, that it is from the large erees or plants of white coral, ijprad evary wherc over the bottom of the Red Sea, periealy in imitation of plants on land, that the fa has obtained this rame.-I faw one of thete, which, from a root nearly central, threw out ramifications of an almolt circulas form, meaturing 26 feet every way."

Our author has alfo made many ufeful cbfervaticns on the navigation of this tea. "All the wellent there (he fays) is bold, and has morc depth of water than the eaft; but on this tide there is neither anchoring ground nor floals. It is rochy, with a conliderable depth of water cverywhere; and there are a number of finken rocks, which, thongh not vifible, are fufficiently. near the furface to deftroy a large flip." The caule of this, in Mr Bruce's opinion, is, that the mountains in the fide of Abyffrial and Legpt are all of hatal Itwen, porphyry, many diflerent kinds of marble, granite, al... bafter, and balialies. Thete Leing a!l cumprict of tohid materials, thercione, cinn part with very lotte dult or fand, which might athes wife be buwn from them into the fal. On the oppoli:e cialt, viz, that of Hejarand Tanamali, on the Arabion fide, the whole cor.fifts of moving fands; a hange quantaty of whice, is blown from the fonth catt by the dry wimter monzions.s: whicla being lodged among the rowk on that lide, athe confined there by the noith walt or fuer rece montion... which is in a contray direcilo:s, hinderstiena fiom co. ming over to the Egyptian fide. Hence the wedto. coalt is full of tunk rochs for warte of fiand to ecrer them, with which they would cthervie. become illand. They are naked and bare all round, with Tharp poian, like focurs; while, on the enft-lid: cir:y :ock burtm:シ

 I nownt：buile whes for holsing water， 1 suppote $\therefore$ aht their weight，after navigating their fortion of th．：hat mel in the du－time，come tarely and quately to ot wur wellech in the attemonn ；ird in the lietle har－ itats patis the night，to fall into the channel again next m ri．ing．＂

Il．e re？ern chanal of the Red Sea was chofen，in th：diysef the l＇zelemies，for the track of the Indian ：ad Alican．Theie minnurchs ereted a great number of citics all ：lherg the wellem conle ；and notwithtand－ ing tha dangers of the navigation，we do not hear that：it waserer abandnod on aecourt of them．

From the officrations made by nur author on the ravig ti nof the Red Ses，he undertakes to poirt nut a fife p．．flage for large fhips to the gulph of Suez，to that they may be able to judge of the propriety of their （wn courfe hembelves，without rrufting implicity to the pilotsthey meet with，who are often very ignerant of tleer protetlion．This fea，according 10 Mr bruce， may he divided into four parts，of which the channel oce ip cs two，till near the latitude of $26^{\circ}$ ，or that of Colfair．On the welt it is deep water，with many rocks ；and on the eatt it is full of illands，as has been already mentioned．Between thefe illands there are chamels and harbours of deep water，where fhips may be protedted in any wind ：but a pilot is necelfary in failing an org thele from．Muchn to Suez，and the voy－ age befides can be continued only during part of the day．Ships bound to Suez withont the confent of the fheriffe of Mece：s，that is，without any intention of fell－ ing their cargonat Jidda，or paying cuftem there，ought to take in their freth water at Mochat；or if there be any reafon againft this，a few hours will earry them to Azab or Saba on the Abyfinian coaft，where they may he plentifully fupplied：but it mult be remembered， ＂that the people hereare Galia，the moft treacherous atal villanous wretches on earth．＂

Here not only …se：may be procured，but plenty of hicep，goats， with fome myrrh，and incenfe in the proper feafon．－－ fe－e．t cautinn，however，mult be ufd in dealing with the people，as even thofe of Mocla，who are abtolutely necelfiry to them in then commercial dealings，cannot truft thein without harety or hoftages．Not mans years x50，the firgenis and mate of the Elgin Ealt India－ man，if：th fever．l other h．illors，were murdered by thefe fis．gees as they went athore to purchafe my rrh，though thev h ed a letter oi safe condtict from the fhekh．

To fueb as do nt want to be known，our anthor recommends a low black innind en thee co．ft of Arabia， namal Cararan，ia latitude $15^{\circ}=0^{\prime}$ ．It is diftinguifh－ c．l by whi．e hellfer fortrets on the welt end of it ； where water is the had in till greaier plenty than at Acab；bue no provilinns，of fuch only as are very bad， canb：；rocureth．If i：is necelfary not to be feen at －11 on the entl，the iflatad of Foollh is ree mmended by our author a，having excellent water，with a faint no mon＇t，whole rfitec is to keep the wells clean．This is one of the chain of iflands which fretehes almof verofs the gylph from Loheia to Maruah，and from ac－
tual obrenvation by Mr Bruce，is found to be fituated Red Sca． is N：Lat． $15^{\circ} 59^{\prime} 43^{\prime \prime}$ ．E．Long． $42^{\circ}+7^{\prime}$ ．Fiom thas to Yambo there is a faje watering．place；and there is an abtolute neceflity for having a pilot before you conte to Ras Mahomet ；becaufe，over the Elanitic gulph，the mountains of Aucha，and the Cape itfelt． there is often a hick haze which latts for many ditys ingrether，and a number of thips are loft by miftaking the caltern biy or Nilanitic gulph for the entrance of the gulph of sue\％；the former has ：ridge of anchs nearly acrofs it．After teachints Sheduan，a large illand，about three leagues farther in a north by weit direcion，there is a bare rock dittinguithed by no par－ ticular name；but folluated that thips ought not to come whith three leargues of it．This rock is to be left to the weftward at he dillance jutt montioned；at－ ter paffing which you meet with floals forming a pretty broad channel，with foundings from 15 to 30 fathoms；and again，on danding direstly for＇Tor，there are two other oval fands with funk rocks in the chan－ nel，between which you are to Ater．Thor may he known at a diftance by two dills that ftand near the water fide；which，in clear weather，may be feen fis： leagues off．Juft to the fouth－call of theic is the towan and harbour，where there are fome palun－trees ab ut the houfes，the more remarkable，as being the firth that are feen on the coaft．The fuusdings in the way to Tor harbour are clean and regular；＂and，loy giving the beacon a fimall birth on the larboard liand，you may haul in a little to the northward，and anchors in five or fix fathom．＂In fpring－tides，it is high water at Tor nearly about $120^{\prime}$ clock：in the middle of the gulph there is no perceptible tide，but at the fides it runs at the rate of more than two knots in the hour．Tor it－ felf is but a fmall village，with a convent of monks be－ longing to thofe of Mount Sinai．It was taken by Don John de Caftro，and fortified foon after its difeo－ very by the Portuguefe；but has never fince been a place of any confideration；lerving now only for a wa－ tering plate to the fhips trading to or from Suez．－ From this place there is a dillint view of mounts Ho－ reb and Sinai，which appea：above and behind the others，with their tops frequenty covered wills fnow in the winter．

Mr bruce next proceeds to confider fome queftions which may be reckened matters of curiolity rather than any thing elfe．One of thefe is concerning the level of the water of this fed ittelf，which has been fuppofed fe－ verai feet above that of the Meditenanean．＂To this （fays our author）I alfwer，that the fact has been fup－ poled to be fo by $: n$ iquity，and alleged as a reafinn why Ptolemy＇s canal was made from the botiom of the He oopolitic crulph rather then brougtt dae noth acto＇s the inthmus of Sue\％；in which latt cafe it was feared it would fubmerge a great part of Alia Minor． 13a：who has ever attempted to verify the by experi－ ment ？or who is capoble of fett！ing the ditference of le－ vels，amoming，as fuppofed，to fome feet and inches， between iwo proints 120 milcs diffant from cach other， over a defert that has no fetted furfaee，but is chan－ ging its height every day？Befides，fince all feas are in fate but one，what is it that hinders the Indian ocean to How to its level？What is it that heeeps the Indian ocean up？Till this late branch of the queftion is refol－ red，I thall take it for granted that no fuch difference

## R E J

Red Sea of level exifts, whiterer fitolemy's engineers might have pretended to him ; becaufe, to fuppofe it fat, is to fuppofe the violation of one very naterial law of maturc."

The next thing confidered by our author is the pal:fige of the Ifraclites through the leed Sea. At the place where he fuppofes the pafitge to have been, the lea is not quite four leagues broad, fo that it nificht eafily have been croffed in one night without any miracle.

There is about if fathom water in the channel, and 9 at the fides, with grood anchonage everywhe:c ; the farthelt fide is a low fandy coalt, and a very caly landing place. "The draught of the bottom of the gulph (fays he) giren by Dr. Pococke, is very erroneous in every part of it. It was propoled to Mr Nicbular, when in Egypt, in inquire upon the fpot, whether there were not forne ridges of rocks where the water was fhallow, fo that an army at particular times might pafs over ? Bicondly, whether the Etefian winds, which blow frongly all fimmer from the north-wett, could not blow fo violently againft the fea, ans to keep it back on a heap, fo that the Ifraelites might have patied without a miracle? And a copy of thefe queries was left for me to join my inquiries likewite. But I muft ecnfefs, howevel learned the gentlemen were who propofed thefe doubts, I did not think they merited any attention to folve them. If the Etefian winds, blowing from the north-wef in fummer, conld heap up the fea as a wall on the right or to the fouth, of 50 feet high, flill the difieulty would remain of building the wall on the left hand or to the north. Beftes, water ftanding in that pofition for a day, mut have lof the nature of a Huid. Whence came that cohefion of particles that hindered that wall to efcape at the fides? This is as great a miracle as that of Mofes. If the Etefian winds had done this once, they muf have repeated it many a time before and fince, from the fame caules. I'et Diodorus Siculus fays, the Troglodytes, the indigenous in. habitants of that very fpot, had a tradition from father to fon, from their very earlieft and remoteft ages, that once this divifion of the fea did happen there; and that, after leaving the buttom fome time dry, the fea again came back and covered it with great fury. The words of this author are of the moft remarkable kind. We cannot think this heathen is writing in favour of revelation. He knew not Mofes, ner fays a word about Pharmah and his hof ; but records the miracle of the divifion of the fea in words nearly as ftrong as thofe of Mofes, fiom the mouths of unbiaffed undefigning praçans."

Red-Shank, in ornithology. See Scolopax.
Rfo-Start, a fpecies of Motacilla.
Rfolling. Se Turnus.
REDANS, in field fortification. See the article Redens.

REDENDUM, in latr, is ufed fubftantively for the claufe in a leafe wherein the rent is referved to the ictior. 'the proper place for it is next after the limitation of eqlate.

REDDI'CIO, was the third part of the facrifice of the heathens, and confitted of the folemn act of putting in again the entrails of the victims, atter they had been seliginully infpected. See Sacrifice.

REDDLE, a foft, heavy, red marle, of great ufe in colouring; and being walhed and freed from fand

is often fild by the druggits under the name of loce kede: urnienic.

REDEMPTION, in l.w, a faculiy or right of $\because=$ entering upon lands, Ac. that have been fo dand affigned, upon reinburling the purchati-money wi:a legal colts.

Revemption, in theology, denotes the recotery of mankiad from fin and death, by the obcdience and fitcriftee of Chrilt, whon on this account is called tlac $R:-$ demer of the acrild. See Theologr:

REDENS, Redans, or Redan, in furtifacaion, is kind of work indented in form of the teeth of a faw, with falient and re-entering angles; to the end that onec part may flank or defend another. It is likewife called facu-work and indeuted work. The lines or filces in this Atank one another.

Redens are ufed in fortifying walls, where it is not necellary to be at the expence of building baftions; as when they fand on the fide of a river running through a garrifon town, marfh, the fea, \&c. But the fault of fuch fortification is, that the befiegers from one battery may ruin both the fides of the tenaille or front of a place, and make an affanlt without fear of being enfiladed, fince the defences are mined. The parapet of the corridor is likewife often redented or carried on by the way of redens. The redens was ufed before baftions were invented, and fome people think them preferable.

REDI (Francis), an Italian phyfician and polite fcholar, was born at Arezzo in Tufeany in 1626. His ingenuity and learning recommended him to the office of firft phyfician to Ferdinand II. duke of Tufcany ; and ree contributed not a little toward the compiling of the Dictionary of La Crufca. He wrote upon vipers, upon the generation of infects, and compofed a good deal of poetry. All lis writings, are in Italian; and his language is fo fine and pure, that the autbors of the Dictionary of La Crufea have often cited them as Italudards of perfection. He died in 1697.

REDOUBT, in fortification, a fmall fquare fort, without any defence but in front; ufed in trenches, lines of circumvallation, contravallation, and approach; as alfo for the lodgings of rorps-de-guard, and to defend paffages.

REDUCTION, in the fehools, a manner of bring. ing a term or propofition, which was before oppofite to fome other, to be equivalent to it.

Revuction, in arithmetic, that rule whereby numbers of different denominations are brought into one dcromination. Sce Arithmetic.

Renuction of Eqsations, in algebra, is the clearing them from all fuperfluous quantities, bringing them to their loweit terms, and feparating the kiown from the unknown, till at length only the unknown quantity is found on one fide, and known ones on the orlier. The reduction of an equation is the laft fart of the refolution of the problem. See $\triangle$ lgebra.

Reduction of a figu:e, defign, or draught, is the making a copy thereot, either larger or fmaller thay the original; ftill preferving the form and proportion. The great ufe of the proportional compafies is :he reduction of figures, sic. whence they are called contoffes of reducion. See the article Compass.
'lhere are various methods of reducing figutes, \&c.

REFINING, in gereral, is the art of purifying a thing ; including not only the effying or refining of met ils, but likewife the depuration or clarification of liquors. See Metallurgy, PartIl. Clakification; and Pharancy.

Gold and filver may be refined by feveral methods, which are all founded on the cllential properties of thete inetals, and acquire different names according to their kinds. Thus, for inttance, gold having the property which no ot' er metal, not even filver, has of refilting the aation of fulphur, of antimony, of nitrous acid, of marine acid, may be porified by thefe agents from all other metallic fubiturces, and coniequently may be refined. Thefe operations are diftinguilhed by proper names, as purification of gold by an'imony, parting, concenliiver has the pr. perty, which the imperfea metals have not, of refiting the action of nitre, it may be refined by this falt: but the term refining is chielly applied to the purfication of gold and filver by lead in the cupel.

This is performed by the defrution, vitrification, and forification, of all the extraneous and defructible metallic fubfances with which they are allayed.

As none but the periest metals can retift the combined action of air and fire, without lofing their inflammable principle, and being changed into earthy or vitreous matters, incapable of remaining at: l , nger united with fubftances in a metallic fate, there is then a pofibility of purifying gold and filver from ail allay of imperfict metals merely by the action of fire and air ; only by keeping them fufed till all the allay be deftriyed : but this purification would be very expenlite, from the great confumption of fuel, and would be excee dingly tedions. Silver allayed with copper has been expofed longer than 60 hours to a glafs-houfe fire without being perfecily refined: the reafin of which is, that when a finall quantity only of imperfe? metal remains united with gold or filver, it is covered and protefted from the ataion of the air, which is necelfiry for tie combuftion of the imperfed met.lis, as of all combuitible matters.

This refining of gold and filver merely by the action of fire, which was the only method anciently known, was very long, difficult, expenfive, and imperfect ; but a much florter and inore advan.ageous n ethed has been diforered. This meehnd confills in adding to the allayed gold and filver a certain quantity of lead, and in expofing afterwards this misture to the action of the fire. Lead is one of the metals which lofes mon quickl ${ }_{j}$ and eafily a fufficient quantity of its inflammable principle to ccafe to be in a moctallic flate ; but, at the
fime tiane, this metal has the remarkable property of Refinisg. retaining, notwithfanding the attion of the E:se, enough of this fame inflammable principle to be very eatily melted into a vitrefied and poweffaliy viritying anatier, called libarze.

The lad then which is to be adiled to the gold and filver to be relined, or which happens naturally to be mixcd with thele netals, froduces in their rctising the followiag advartares: 1. By iacreatheg the proportion of imperfeit metals, it prevents then from beirg io well coverel and protected by the peltect metals. 2. By uniting with thele imperfect metals, it commannicates to them a preperis it has of luling very ealily :t great fart of its inflimmable principie. 3 By its witrifying and fufing property which it exercites with ail its force upon the calcined and naturally refratiory pasts of the other metals, it facilitates and accelerates the fution, the fco:ification, and the feparation of thefe metals. 'Thefe are the advantages procured by lead in the refining of gold and fitver.

The lead, which in this operation is fcorified, and fcorifies along with it the imperfect met:als, feparates from the metallic mafs, with which it is then incapable of remaining united. It floats upon the furface of the melted mals; beraufe, by lofing part of its phlogif. ton, it lofes alfo part of its fecific gravity, and lathy it vitrifies.

Thefe vitrified and melted matters accumulating more and more upon the furface of the met.al while the eperation advances, would protect this furface from the contact of air which is fo abfolutely neceffary for the ferification of the relt, and would thus ftop the progrefs of the operation, which could never be finithed, it a methos had not been contrived for their removal. This removal of the vituificd matter is procured either by the nature of the veffel in which the melted matter is conntained, and which being porous, abforbs and imbites the fecrified matter as fait as it is formed, or by a channel cut in the edge of the veffel through which the matter flows out.

The reffel in which the refining is performed is flat and fhallow, that the matter which it contains may prefent to the air the greatelt furface pofible. This form refembles that of a cup, and hence it has been called cupcl. The furnace ought to be vaulted, that the heat may be applied upon the fufface of the metal during the whole time of the operation. Upon this fiuffice it cruft of dark-coloured pellicle is contirually forming. In the inftant when all the imperfect metill is deftroyed, and confequently the forification ce:res, the furface of the perfect metals is fecn, and appeats clean and brilliant. Thus forms a hind of fulguration or corsication. By this mark the metal is lnown to be reiseed. If the operation be fo conducted that the ractal ful: tains only the precife degree of heat neceliary to keep it fufed before it be gerfegily refined, we moy nt ferve that it fixes or becomes fulid all at nure in the very inAtint of the corufcation; becaufe a freater heat is required to keep filver or gold in lufion when they are pure than when allayed with lead.

The operation of refining may be periormal in imall or in large quantities, upon the fanc principles, but only with fone differences in the mand arment. As the refining of fmall quantities of perfect me:als is rerfirn)ed in the fame manner as thecic motals are ciflyed, thes
P. Renion oflay isins conly a rery accu-ate retinn wo reitr to the article Lios tr of the Chinc of Silter.
Large quatitics of filuer are al us purited, after the operations by which that metal is obtained low its ores. 'This ther, being always mueh allayw, is to be nised with a fitheinat quatitity of le.d to corrplate its puritication, unlef lead hat, been added in its firit fulion from the ere, or untct, it has been extrated from an ore whichali) e ont.ins lani ; ia which lattere care, it is alleyed natuatly wish a fulli actit quataty, w more than fubtient. fir the refione, fit.

REFALCTION, be retath of progrolive mation of a moriny body, ncentimel by fumie coblacle which hinderal it from purfing its fo: mer direction.
 formentiring a: le, onat very great degree nt aceuracy. It was invented by the celcbrated allion naer Mr Toobias hiolyer of Gottineca, primcipall! with a view to do away the corors of the divifions of the limb; and lis firie been mach improved by the Chevaher de Bord, and M. J. H. de Alagellas. This inftument is part cularly anplicable to the mafuring of the ditances of the beaverly badies, and wats ufed by the French in the'r part of the operation for determining the difference of oneridians of Paris and Greenwich. For the de:cription. reqification, and ufo of this infrument, fee the article Nivigation, and Mackay on the Longitude, voi. i. p. 44.

Reilevtiov of the Rigs of Light, in catoptrics, is their return, after approaching to near the furface of Wedies as to be thereby acpelled or driven backwards. For the cautcs of reflection, fee Optics, Index at R.zys of Light and Roff.cition of Light, \&c. For the appliatain of the doetrine of reflestion to mirrors, fee Detics, f. 34-3-349. See alfo Mirror, BurningGlafies, and Glajs-Grinning ; and for the coating or follialing of mirrors, fee the article Follating of Looling\#afs, \&ic. Sce alfi) T'elescope.

Retlection is alfo ufed, figuratively, for an operation of the mind, whereby it tums its view backwards :Is it were upon itfelf, and makes iffelf and its own operations the olject of its difquifition; and by contemphating the manner, order, and laws, which it obferves ill percciving ideas, comparing them together, reafoning, sec. it frames new ideas of the relations difcovered therein. Sie Metaphysics.
?2EFLEX, in painting, means thofe places in a pifture Which are fuppofed to be illuminated by light refiected from fome other body in the finic piece. See Paintwice Part I. fect. 2, and 5 .

REFLTX, the backward courfe of water, has the fomemeationg as the ebbing of the fea, and is nppofed to flond, flux, or the fluwing of the fea. See T'ides.

REFORM me:ns a change from worfe to better, a re-cllablithment or reviral nt former neglected difipline, or a colreation of abutes therein. The term is much ufed in a monaflic fenfe for the relucing an order or songregation of religious in the ancient teverity of the rule from which it had graduzlly fiverved, or even for improving oa the ancient rule and inftitution itfelf, and volmarily making it more feverc. In this fenfe the order of $S:$ Bernard is fidd to be only a veiorm of that of St Benedict. In this country it is applied both to polities and religion, and may innocently be applied to any endeavours to change an cflablifhment from worfe
to betier. Bat it appears at prefent to here teche keform. chiefly inade a pretence for deliyms whicia could not - timly or fufely be avowal.

Areform in elegion and in panliament (fec Partam: : T) h.1., in Eingland been alleged to be mont loudly calted for by men whole religious notinas are immenicly different from what has been geenerally reckoned Chrif. tianity, and whole defigns, as has teen tuggelted, went in the overthrow of all civil order. For inidicus purpofes like thefe, the word reform is a good cloak, elpsci.ally if any thingrom be fixed upon, cither in the relicgion or govemnent of the flate, which, with the leclp of exar. geration and diftortion, can be reprefented to the weak and unthinking as extremely defettive and erromeous.

The gencral erere of thete men is faid to be, that hatving picked up a fet of fpeculative netions whela fatter ther own pride and the pride of thofe who litens to then, they will allow nothing to the arguntenes of their opponents or the experience of mankind. They think to oten and fo much upon their ideal reforms, that while they imagine their notions are lberal and extenfive, they become contrusted beyond imagination ; while their judgments, of courfe, are warped with the mont inveterate projudices (fee Prejudice.) They fec, or think they fee, the propriety of their fchemes; but it is faid they foldom, perlaps never refect, that that may be true in fpeculation or in theory which cannot poffibly be reduced to practice. They will not take the world as it is, and allow it to profit by the wifdom and exprience of ages; but they will reform it according to thofe ideas of right which they have learned from their own Speculations and airy theories; feldom confidering whit may be done, they are determined in do what they think ought to be done. Libetty of confeience, and liberty of attion, have been claimed by them as the unalienable rights of man ; and fo we ourfelves are difpofed to think them: and it has been urged that in this country they have not been denied to any man, or fet of men, fo Ear as has been thonght confiltent wit? the fafety of the fate, and that of the other individuals who compofe it. At the fame time, the very fame men hefitate not to blame, with acrimony the moft violent, and to the utmoft of their power to reftrain, the aations and opinions of thofe who with equal ennviction, often on different grounds, and generaliy with much modelty, differ from them.

Amidit that exceffive ardour, too, with which they propagate their opinions, they forget the extreme danger of withdrawing the attention of that part of the community, who mult earn their bread by the fweat of their brow, from their proper occupations, to the tempelluous fea of political debate, for which their education and mode of life cannot poffibly have qualified them. It requires but very little penctration, however, to be able to fee, that it can be of no real fervice either to the individuals themfelves, or to the community at large, in whatever light we look upon it. Indeed, to make thofe the judges of the law, and the relormers of the legitlature, who lawe all their lives been employed in manual labour, is the extreme of folly; and yet it is what fome men of confiderable abilities, have judged highly proper and have more than once attempted. The effeet of fuch a mode of fedustion (if is deferves that name), when it thall become general, inftead of ferving the purpofes of a real reform, muft be to annilhilate all civil order. Diffitisfaction

Keform, tisfaction is the moft powerfin check to honef induftry; Reforma- and dilfitistaction and idlenslis mut be the elfest of the tion. $\underbrace{\text { lion. }}$ wanderings of fuch men in the labyrinths of politics; which, for uncultivated minds cipecially, pives the way for every fuscies of vice, and gradually ripens them for any wickeduels, however atrocicus. For the trull of thefe remarks, appeals are made to the hiftory of man. kind from the Cieation to the prefent time : however, the foler friends of reform, ar:d many fuch, we doubt not, there are, will undoubtedly retlea, that in the prefent day we have as much to fear from licentioufref's as froum defpotifm : from reform carried to an cxtreme as mucly as from the pretended attempts of magiftrates to :mmihilate real liberty (See Revoiution).

It may alfo be worth their while to conlider, that times of public danger are not generally the belt ad:upted to attempt clanges of government; becauti what might fatisfy one party: would probably be thought too little by another, and divifons at fuch a period are molt dingerous. When, therefore, attempts are mide for reform whicb appear to be inconfiftent with the fafety of the ftate, reftrictions muft be ufed, which may by feculative men be thought fevere and unneceifary, but of which they themfelves are the caufes. Thefe refrictions too will be patiently fubmitted io by the wifer part of the community, when in more peaceabic times they would neither have been thought of nor al. lowed.

Speculative reafoners may fpeak as much as they will of enlightening the minds of men, and of reforming government by the distates of a refined and dif. paflionate philofophy; but when they come to apply their notions to practice, they will either find their reprefentations little better than empty founds, and therefore ineffectual ; or, as is more generally found to be the cafe, thofe fehemes which in theory appeared to be perfect, will in practice, when combined with the malignant and ambitious paffinns of men, lead to ruin and diforder. The firf inititution of government, except among the Jews, was unquentionably the effect of paffion and intereft combined; and this palion and this intereft, reftrained within due bounds, is prodnctive of much happinefs. That government, we believe, too, will be belt fupported and mof productive of happinef3, in which the mutu.1] patlions and interelts of the individuals who compofe it are fo equally poifed as to fipport ons another, and to promote each the ends and fuccefs of the other: and this by the ableft reafoners and the bet menl las been thought to be the cafe with the Britifh conttitution. If the modern favourers of reform fhould think this an unfable fupport, if they will confider the wold as it ever has been, and as it is, they will find it the conly one we lave, except religion; and they will thence be inclined to make the beff of it. If, after all, however, they thould be difpofed to doubt the pofition, we have only further to requef them, uith the fincerity of men and of Clirifians, to confult their own breafts, and ferioully io confider the probable motives of thofe who act with them. They will then perhaps fee, and they furely ought to acknowledge, that few men have afted more according to the impulfe of paffion, intereit, and ambition, than thofe who have for fome time paf founded the toczin of reform.

REFORMATION, in general, an act of reforming or correcting an error er abufe in religion, difci-
phine, or the like. By way of cminarce the word is ufed for that great alcerstion and reforreation in the corrupted fyflem of Chrifianity, begum by Luther in the jear 1517.

Under the article History (fcet. ii.), the various corrup:ions in religion, the oppraflioss and ufurpations of the clergy, and the extreme infulence of the popes, hivebsen fos fully treated of, that any further detail hare is unnecefiaty. It is fufficient to oufer ve, that, beforc the peicd of the Reformation, the Pope had in afinure the mof atudacious mannerdeclaredhimfelfolh= fovereign difootal of of the whole world. All the farts of it which were tine whole inlabited b; thofe who were not Chriaians, le account- world. ed to be in habited by no-body; ar.d if Chrintians took it into their heads to ponefs any of thote countrics, lie gave them full liberty to make war upon the inhabirants without any provocation, and to tratat them with no more humanity than they would luwe treated wild bealts. The countries, if conquered, were to be parcelled out according to the pope's pleafure ; and dread. ful was the fituation of that priace who refufed to obey the will of the holy pontiff, of which many inflances will occur to the reader in the various hiftorical articles of this work. In confequence of this extratordinary anthority which the pope had affumed, be at laf granted to the king of Portigal all the countries to the eatlward of Cape Non in A:rica, and to the king of Spain all the countries to the weftward of it. In this, according to the opinions of fome, was completed in his perfon the charadter of Antichrif fiting in the temple of God, and peruing bimflf as Gcd*. He had long before, : 2 Thers. fay they, allumed the fupremacy bslonging to the Dei-ii. 4 . ty himfelf in firitnal matters; and now he aftumed the fame fupremacy in wordly matters alfo, giving the extreme regions of the earth to whom he pleafed. Tlie Reformation, therefore, they confider as the immediate effect of divinc power taking vengeance on this and all other deviations from the fydem of truth; whle otlees confider it merely as an cffect of natural caufes, nud which might have been forefeen and prevented, without abridging the papal power in any confiderable degree.

Be this as it will, however, the abovementioned parLition was the lalt piece of infolence which the pope ever had, or in all probability ever will have, in his power to exercife, in the way of parcelling out the globe to his adherents. Every thing was quier, every beretic exterminated, and the whole Chriftian world fupinely acquiefeed in the enormous abfurdities which were inculcated upon them; when, in 1517, the cmpire of fuperAition began to decline, and has continusd to do fo ever fince. The perfon who made the firit attack on the Reformaextravagant finpertitions then prevailing was Martin tion bequa Luther; the occafion of which is fully related under by Luther. the article Luther. By fome it is pretended, that the only motive which Luther dad in beginaing the Rc formation was his enmity to the Dominican friars, who had excluded his order (the Augultins) from all fhate in the gainful traffic of indulgences. But this does not fcem at all probable, if we confider that finch a motive would not naturally have led him to deny the vistue of indulgences, as fucb conduct could not but exclude him for ever from any chance of a thare in the traffic, which otherwife penhaps he might have chtained. Belides, the extreme contrariety of this traffic to the common principles of reafon and boneffy was fo great, that we

## REF [ 4i ] REF

for he, convinced that Luther's dofrine muft foon le totally deftroyed and fuppreffed unlefs it received a fpeedy and effectual fapport, ordered Luther and Nílancthon to draw up a-body of laws relating to the form of ecclefiafical geverrment, the methicd of public woinhir, Ece. which was to be proclaimed by heralds throughout his dominions. This example was followed by ali the frinces and fates of Gcimaty who renounced the papal fupremacy; and a like form of worflip, difcipline, and government, was thus introduced into all the churches which difented from that of Rome. This open remunciation of the Romith juriddiation foon charged the face of iffairs: : and the patrons of Popery foon intimated, in a mannecr not at all ambigu us, that they intended to make war on the Lutheran party; which would cotainly have been put in execution, had not the trouthes that took place in Europe difonecrted their meafures. On the other hand, the Lutherans, apprifed of thefe hoftile intentions, began alfo to del:berate on a proper plan of defence againat that fuperltitious violence with which they werc in danger of being afluiled. The diet of the empire affembled at Spire, in the year 1526; where the emperor's ambafiadors were defired to ufe - their utmon eadeavours to fupprefs all difputes about religion, and to infift upon the rigorous cxecution of the fentence which had been pronoenced againit Luther and his followers at Worms. The greatclt part of the German prinecs oppofed this motion with the utmott refolution, declaring that they could not execute that fentence, nor come to any determination with regard to the doetrines by which it had been occalioned, befnre the whole matte- was fubmited to the decifion of a council lawfully afembled; alleging farther, that the decifion of controverfies of this nature belonged properly to it, and to it alone. This opin:on, after long and very warm debates, was adopted by a great majority, and at lengtla confented to by the whole atembly: for it was unanimoully agreed to prefent a folemn addrefs to the emperor, intteating him to affemble, without delay, a free and general council; whle in the mean time it was alfo agreed, that the princes of the empire Thould, in their refpective dominions, be at liberty to manage ceclefiaftical affairs in the manner they fhould think moft proper ; yct fo as to be able to give to God and the emperor a proper account of their adminittration when it thould be required of them.

Thefe refolntions proved extremely favourable to the caufe of reformation ; neither had the emperor any leifure for fome time to give difurbance to the reformed. The war, which at this time enfucd between him and the pope, g.ve the greatelt advantage to the friends of the relo:med, and confiderably augmented their number. Several princes, whom the fear of perfecution and puniflment had hitherto prevented from lending their alaiftance, publicly remounced the Romilh fupertition, and introduced amoner their fubjects the fame forms of religious wo:thip, and the fame fytem of doatrine, that had been received in Saxong. Others, though placed in fuch circumflances as difcouraged them from acting in an open manuer againft the interefts of the Roman pontift, were, however, far from difcovering the fnallef oppofition to thofe who withdrew the people from his defpotic yoke ; nor did they molet the private affemblies of thofe who had feparated themfelves from the Vol. XVI.

Ferdinand the emperor's brot?er, who prefided in the diet, Charles himfelf being then at Barcelona, they entered a fulemn protelt againgt this decree on the igth of April, and appealed to the eniperor and a future council. Hence arofe the denomination of Protelant's, Origin of which from this period has been given to thofe who fe- the name parate from the communion of the church of Rome. l'sotetauts The princes of the cmpire who entered this proteft were, John elector of Saxony ; Gcorge elector of Bran:denburg ; Erneft and Francis dukes of Lmmenburgh; the landgrave of Hefie; and the prince of Anhalt. Thefe rere feconded by 13 imperial towrs, viz. Strafburg, Ulm, Nuremberg, Contance, Rottingen, Wind. feim, Memingen, Nortlingen, Lindaw, Kcmpton, Heilbron, Wiffemburg ; and St Gall.

The diffenting princes, who were the protectors and heads of the reformed churches, had no fooner entered their proteft, than they fent proper perfons to the embperor, who was then upon his palfage fiom Spain to Italy, to acquaint him with their proceedings in this matter. The miniters employed in this commiffion executed it with the greatef intrepidity and prefence of mind ; but the emperor, exafperated at the atudacity of thofe who prefumed to differ from him, catued the ambaffadors to be arrelted. The news ot this violent ttep made the Proteftant princes comclude, that their perforal fafety, and the fuccefs of their caule, depended entirely upon their own courage and union. They determinod, therefore, to enter into a folcmn confeicracy : for which purpole they held feveral meetings at Rot, Nuremberg, Smitcald, and other places: but fo different were their opinions and vicws, that they could determine upon nothing.

One great obfacle to the intended confederacy was Conference the difpute which had arifen between Luther and Zuin- between glius concerning the real prefence of Chrift in the Lutherand Lord's Supper. To terminate this difpute, if pollible, Zuinglius. Mhilip, landgrave of Heffe, invited, in the year I529, to

Rcforma. his dominions. Dut with his fuccefor it was otherwife;

ciuch of Rnms. And in general, all the Germans who, before taefe refolutions of the diet of Spire, litd rejected the papal difcipline and dectrine, were now, in confequence (1 lle literty they enjoyed, wholly employed in bringing their fomemes and plans to a certain degace of confifence, and in adding vigour and firmercis to the caufe in which they were engaged. But t! is tranquility and liberty was of no long duration. In 1529, a new diet was aflen:bled at the fame place by the emperor, after he had quieted the troubles in varicus patts of his dominions, and concluded a reace w th the pope. The power which had been armted to puin pevo 10 ces of manazing ecclefraftical affairs till the meetinc of ene
 a general courcil, was now revoked by a majori:y of ror.
votes; and every change declared unlawful that thould be iniroduced into the doctrine, dicipline, or worthip of the eftablifhed religion, before the determination ot the approaching council was known. This decree wa; confidered as iniquitous and intoleabla by the elector of Suxony, the landgrave of Heff, and other members of the diet, who were perfinaded of the neceflity of a reformation. The promife of focedily at?embling a general council, they looked upon to be an artifice of the church of Rome; well knowing, that a free and lawful council would be the laft thing to which the pope trouls confent. When, therefore, they fuund that all their arguments and remonflances made no impreflion upon

 whered on the refotixe paties of thete ent nding chieis: bat thas necatime wisn tationded wit! the fahatary eriects which were expeited irom it. Thice divines difuited for four dyys in prelenes ut the lindgrave. Lontherattachod Oec lamp dius, and Zuing liu, wits attacked by Mclatcolait. Zuing! ins was :lecticat of te cfy, notorife on atcoumt of his cxplantion a the hature and deitgraif the Lord's Su prat but almo in confeguence of the falfe notions he was teppoled wh hate adeperad concesnieg the divinity of Chtith, the efticacy of the disine wird, original fin, and tome other purs of the Clis:liin de derite. This illultious reformer, however, cocared himbell in m the gicatelt patt of thele charges with the moll triumphant evidence, and in fuch a mastner as appeared fatistactory even to Lather hmfelt: but their difention concermin the mamer of Chrat's prefence in the encharitt flall renamed; nor could either of the contending parties be pertiaded to abandon, or even to modity, their opinious on that matter. The (aly advan:age, theretore, which refulted from the meetins was, that the jarring doctors formed a kind ot truce, by agreeing to a mutual toleration of their fentiments, and lewving to the difpofal of l'rovidence the eure cf their divilions.

In the mean time news were received that the emperor defigned to come into Germany, with a view to terminate all relogious differences at the approaching diet of Augburer. Having forcfeen tome of the confequences of thole difputes, and, befides, taken the advice of men of wiflum, fagacity, and experience, he beeame at certain times more cool in his proceedings, and more impartial in his opinions both of the contending parties and the merits of the caufe. He, therefore, in an interview with the pope at Bologna, infifted, in the noft ferious and urgent manner on the neceflity of a greneral council. His remonftrances and expo. fulations, however, could not move the pontiff; who maintained with \%eal the papal prerogatives, reproached the emperor with an ill-judged clemency, and alleged that it was the duty of that pronce to dupport the church, and to exerute lpeedy vengeance upon that obfinate heretical faction who dared to call in queltion the authority of Rome and its pontiff. To this difourfe the emperor paid no regard; looking upon it as a moft inisulutus thing, and a meafure ditcitly oppofite to the liws of the empire, to condemn unheard a fet of men who had aluays ajproved themfelves good citizens, and
deferved well of their country in feveral refpects. Hitherio indeed it was not eafy for the emperor to form a clear icea of the matters in debate, fince there was no regular fyllem as ytt compofed, by which it might be Lnown whith centanty what were the true canfes of Luther's oppofition to the pope. The elector of Saxony, therefore, ordered Luhter, and other eminent divines, in commit to writing the chief artieles of their religions fyitem, and the principal points in which they diflered from the charch of Rome. Lather, in comptiance with this order, delivered to the clector at Torgaw 17 articles which had been agreed upon in a conference at Sultzbach in 1529; fiom whence thefe received the name of the artisles of Torgaze. But though thete were decmed by Luther a fufficient declaration of the fentisnents of the refurmers yet it was judged proper to en-
large them, in order to give perfuicuity to their arma.
ments, and Hength to their caufe. In this wert Me. hanchon was en ployed; in which he foowed a proper delerence to the conncils of Luther, and expreffid lis fentiments and doctrine with the greatell clegance and Fertpicaity; and thus came forth to view the famous Confegion of Augsburg.

Oin the 15 th of June is 50 , Charles arived at Augiburg, and the diet was opened five dilys after. 'Ilhe Protellants reccived a formal permiltion to prefent am acenumt of their tenets to the diet on the 25 th of the fime mon'h ; in confequence of which, at the time afpuinted, Clmintian Bayer, chancellor of Sixany, read, in the Cerman langurge, belore the emperor and the pitaces anlembled, the contetion of Augburg abovementioned. It consaned $25^{\prime}$ chapters, of which 21 were employed in reptefen:ing the religions opinions of the Pretellants, and the other feven in pointing out the crrors and fuperllitions of the church of Romic. The pinces heard it with the deepel attention and recollection of mind: it contirmed some in the principles they had embraced; furprifed others; and many, who before this time had little or no idea of the religinus fentiments of Luther, were now not only convinced of their innocence, but delighted with their purity and limplicity. The copies of this Confefion, which atter being read were delivered to the emperor, were ligned by John elector of Saxony, George marquis of Bran the empedenburg, Erneft duke of Lumenbuig, Ihilijs landgrave for. of Helfe, Wullgang prince of Anhalt, and by the Imperal cities of Nuremberg and Reutlingen.

The creatures of the church of Rome who were pre- a refutafent at this diet employed Johm Faber, afterwards bilhop tion of it, of Vienna, together with Eckius, and another doctor in which named Cocklezs, to draw up a relutation of the Piotef the Protetant confellion: which refutation having been publicly read, the cmperor required the Protellant members to acquiefce in it, and put an end to the religious difputes by an unlinited fubmiffion to the opinions and doctrines contained in this anlwer. But this demand was far from being complied with. The Proteltants declared on the contrary, that they were by no means fatisfied with the reply of their adverfarics; and earnefly delired a copy of it, that they might more fully demonltrate its extreme infufficiency and weaknefs. But this reatimable requeft was refufed by the emperor; who interpofed his fupreme authority to prevent any fartier proceedings in this matter, and folemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out thefe religious debates. This, however, did not reduce the Protellants to filence. The divines of that communion, who had been prefent at the diet, endeavoured to recollect the arguments and objections employed by Faber, and had again recourfe to the pen of Melancthon, who refuted them in an anıple and fatisfactory manner in a piece which was prefented to the emperor on the $22 d$ of September, but which Charles refufed to receive. This aniwer was afterwards enlarged by Melanethon, when he had obtained a copy of liaber's reply; and was publuthed in the ycar 1531, with the oher pieces that related to the duetrine and difcipline of the Lutheran chusch, under the title of $A$ Defence of the Confeflion of Augsburg.

Matters now began to draw towards a crifis. There were only three ways of bringing to a conclufion thefe seligious

toleration and privilege of ferving God as they thought preper: 2 . T'o compel them to return to the church of Rome by the violent mathods of perfecution: or, 3. That a reconciliatir n thould be made, upon fair, candid, and equitabie terms, by engaging each of the parties to temper their zeal with moderation, to abate reciprocally the rigour of their pietenlions, and remit firmething of their refpeetive clainis. The third expedicut was mot gererally approved of, being peculialy agreeable to all who had at heart the welfare of the empire; nor did the pope feem to look upon it either with averfion or contempt. Various conferences therefore were held between perfons eminent fur piety and leaving on both fides; and nothing was omitted that might have the leaft tendency to calm the animofities and heal the divifions which reigned between the contending parties. But the differences were too great to admit of a reconcilition; and therefore the votaries of Rome had recourfe to the pnwerful arguments of imperial edicts, and the force of the fecular arm. On the $19^{\text {th }}$ of November, a fevere decree was iffued out by the exprefs order of the emperor (during the abfence of the Heflian and Saxon princes, who were the chief fupporters of the proteltant caufe), in which every thing was manilettly adapted to deject the friends of religious liberty, excepting only a faint and dubious promife of engaging the pope to affemble a general council about fix months after the feparation of the diet. In this decree the dignity and excellence of the Popifh religion were extolled beyond meafure, a new degree of feverity and force was added to that which had been publilhed at Worms againft Luther and his adherents, the changes which had been introduced into the doctrine and difcipline of the Proteftant churches were feverely cenfured, and a folemnorder wasaddreffed to the princes, cities, and ttates, who had thrown off the Papal yoke, to return to their allegiance to Rome, on pain of incurring the indignation and vengeance of the emperor as the patron and protector of the church. Of this formidable decree the elector of Saxony and confederated princes were no fooner intormed, than they affembled in order to deliberate on the meafures proper to be taken in fuch a crifis. In the years $153^{\circ}$ and 1531 they met, firlt at Smalcald, and afterwards at Francfort, where they formed a folemnalliance and confederacy, with the intention of defending vigorounly their religion and liberties againft the dingers and encroachments with which they were threatened by the edse of Augburg, without attempting, however, any thing offenfive againt the votaries of Rome; and into this confederacy they invited the kings of England, France, Denmark, \&c. leaving no means unemployed that might corroborate and cement this important alliance.
This confederacy was at firft oppofed by Luther, from an apprechention of the calamities and troubles which it nieght produce ; but at laft, perceiving the neceffity of it, hie confented; though he uncharitably, as well as imprudently, refuted to comprelend in it the followers of Zuinglius among the Swifis, together with the German fates and cities who had adopted the fen. timents and confeffion of Bucer. In the invitation addreffed to Henry VIII. of Enelland, whom the confederate princes were willing to declare the head and - protector of their league, the following things, among
others, vierc exprefly nipulated: That the kirg floojai encourace, promete, and maintain, the unte doctrine of Chrith as it was enntained in the confufion of Aur:burg, and defend the fime the the next gereral conncit: that he fliould not agrec to an; council dimmoned by the bifhop of Rome, but protelt arsinat it; and reci. ther fubmit to its decrees, nol fuffer them to be refpec. ted in his dominions: that he thould nover allow the Roman pontiff to have any pre-eminence or jurifdition in his dominions; that he fheuld adrance 100,00 o crowns for the ufe of the confederacy, and double that fum it it became neceffary : all which articles the confederate princes were equally obliged to obferve on their part. To there demands the king replied, he would mantain and promote the true doctrine of Chrilt; but, at the fime time, as the true ground of that dofirine liay only in the holy Scriptures, he would not accept at any cne's hand what fhould be his own failh, or that of his kingdom; and therefore defired that they would feud over two learned men to confer with him, in order to promote a religious union between him and the confederates. However, lie declared himelf of their opinion with regard to the meeting of a free general council, and promifed to join with them in all luch councils for the defence of the true doctrine ; but thought the regulation of the ceremonial part of religion, being a matter of indifference, ought to be lfft to the choice of each fovereign for his own dominions. Afier this the kirg gave them a fecond anfwer more full and fatisfactory; but after the execution of queen Anne, this negociation came to nothing. On the one hand, the king grew cold when he perceived that the confederates were no longer of ufe to lim in fupporting tl:e validity of his marriage ; and, on the other hand, the German princes became fenfible that they could never fucceed with Henry unlefs they allowed him an abfolute distatcrmip in matters of religion.

While every thing thus tended to an open war between the two oppolite parties, the elector Palatine, and the elector of Mentz, offered their mediation, and endcavoured to procure a reconciliation. The emperor himielf, for various reafons, was at this time inclinced to peace: for, on the one hand, he food in need of fuccours againft the Turks, which the Proteltant princes refufed to grant as long as the edicts of Worms and Augburg remained, in force ; and, on the otleer, the election of his brother Ferdinand to the dignity of King of the Romans, which had been caried by a majority of votes at the diet of Cologne in 1531, was by the fame princes contefted, as being contrary to the fundamental laws of the empire. In confequence of all this, after many negociations and piojefts of reconciliation, a treaty of peace was concluded dt Nuremberg in 1532 , $\mathrm{d} \boldsymbol{r}$ : betwen between the emperor and the protettant princes, on the following conditions; viz. That the latter fhould furnifh a fulfidy for carrying on the war againft the Turks, and acknowledge Ferdinand lawful king of the Romans; and that the emperor on his part thould abrogate and aunul the edicts of Worms and Augfourg, and allow the Lutherans the free and unditurbed exercife of their:eligious doctrine and difcipline, until a rule of faith was fixed either in the free general council that was to be affembled in the fpace of fix months, or in a cliet of the empire.

O:2 the other hand, as the emperor had now no other hope of terminating the religions difputes bat by the meating of a general ccunc l, f:e re. peated lis requets to the pope for that purpofe. The pontif (Clement 111.), whom the hithory of patt councils filled with the greateft uneafinels, endeavoured to A genceal retard what he could net with decencr refure. At lath, in 1533, he made a propofal hy his legate to atfemble Pr meil at Mansua, Piacentia, or Bologna; but the Protelants refured thair confent to the nomination of an Italian council, and inlifed that a contoverif which had its rife in the heart of Germany, finold be determined within the limits of the empire. The pope, by his ufurd anttices, cluded the performance of his owia promife: and, in 153t, was cit ofll by death, in the midft of his ftratagems. His fucceffor l'anl III. feem. ed to thow lefs reluctance to the affembling a general courcil, and in the year 1535 expreffed his inclination to convole one at Mantua; and, the year following, antully fent circular letters for that purpofe through all the fates and kingdoms under his jurifdiction. This council was fummoned by a bull iftlued out on the 2 d of June 1536 , to meet at Mantua the following year: but feveral obitacles prevented its meeting; one of the molt material of which was, that Frederic duke of Mantua had no ircelination to receive at once fo many gucts, fome of them very turbulent, into the place of his relidence. On the o:her hand, the Protiftants were firmly perfuaded that, as the council was aflembled in Italy, and by the authority of the pope alone, he lattor mult have had an undue influence in that afembly; of confuquence, that all things muft have been carried by the votaries of Rome. For this reafon they afiemhided at Smalcald in the ycar 1537 , where they folemn-Proteno- 1y proteted againtt this partial and corrupt council, -iou aganf and, at the fame time, had of new fummary of their
$\qquad$
dotitine drawn up by Lather, in order to prefent it th the alfembled bifhops if it thould be requited of thens. Tlifis fummary, which had the tille of The Arthiles of Smalial!!, is commonly jnined with the creeds and confeffions of the Lutheran church.

After the meetirg of the general council in Mantil was thas preventel, many fchemes of accommo. dation were propoled both by the eniperne and the Pretefanes; but, by the artifices of the chutch of 1R.me, all of them came to nothing. In 1541, the emperor appointed a confermee at Worms on the fubjea of rel ginn, between perfons of piety and learning thofen from the contenzing patics. This confcrence, however, wat, for certain realins, removed to the dict which was to be held is Rulibon that fame jear, and in which the frimeipal fubject of deliberation was a meriorial prefented by a perion unknown, containing a projest of pace. But the conference produced no other effect than a mutual agreement of the contending parcies wofer their matters to a gencral council, or, if
the meeting of tixh a council thould be pievented, to Reforma. the nest Carman diet.

This refolution was rendered ineffequall by a varicty of incidents, which widened the breach, and put off to a farthor lisy the deliterations which were defigned to heal is. The pope ordered his legate to dechue to the dist of Spire, alfembled in $154^{2}$, that he would, aceorsing to the promite he had already Council of made, affemble a general council, and that Trent I'rent prothould be the place of its meeting, if the diet had roo pofel. objeftion to that city. Ferdinand, and the princes who adkered to the caufe of the pope, gave the:r coalfent to thes propofal; but it was wemently objefed to by the Yroteltants, beth becaufe the council was fumnoned by the authority of the pope only, and $: 1-$ fo beenufe the place was within the jurifdiction of the Pope; whereas thacy defired a free counctl, which thould not be biaffed by the difates, nor awed by the proximity, of the pontiff. But this protefation p:oduced no effeet. Paul Ill. perfilled in his purpufe. and ifliued out his circularletters for the convecation of the council, with the approbation of the emper. $r$. In juftice to this pontiff, however, it muft be obferved, that he fhowed himfelf not to be averfe to every ief. rmation. He appointed four cardiaals, and three other by hed pertions eminent for their learning, to draw up a phe the for the reformation of the church in general, and of the chureh of Rome in particular. The retormation propofed in this plan was indeed extremely fupericial and partial, yet it contained fome particulars which could fcarcely have been expeeted from thofe who compofed it. They complamed of the pride and ignorance of the bifhops, and propofed that ne ne flould receive onders but learned and pious men; and that therefore care fhould be taken to have proper mafters for the inftruxtion of youth. They confemed tranlations from one bencfice to another, grauts of refervation, non-refidence, and pluratities. They propofed that fome convents fhould be abolifhed; that the liberty of the prefs thould be refrained and linited; that the coll quies of Erafmus thould be fuppreffed: that no coclefialtic Chould enjoy a benefice out of his own country; that no cardinal fhuuld have a bifhopric ; that the queftors of St Anthony and feveral ither finints fould be abolifhed; and, which was the beft of all their propofals, that the ctfects and perfonal ellates of ceclefialtics thould be given th the poor. They corcluded with complaining of the prodigions number of indigent and ragged prietts who frequented St Peter's church ; and declacel, that it was a great cancal to fee the whores lodged fo matrnificently at R me, and riding through the ftreets on fine mules, whife the cardinals and other ecclefiaftics accompanied them in the molt contenus manner. This plan of reformation was turned into ridicule by Lather :m. 1 Surmius; and indeed it left unredrelled the m-ll intolerable grievances of which the Proteftants complained.

All this time the emperor had beon labouring to war be porfurade the Prubeltants to eonfent to the meeting of twecu the the courcil at T'rent ; but when he found them fixed in their opportition to this menfure, he began to liften to the fanguinary meafures of the pope, and refulved to terminate the difputes by force of arms. The clector of Saxony and landgrave of Heffe, who were the chief fupportcrs of the Proteftant caufe, upon this took

 REFReforma- proper mesiures to prevent their being furptifed and tion. overwhelmed by a fuperior forse ; but, before the horrors of war comimenced, the great reformer Luther died in peace at Ayfellene, the place of his nativity, in 1546.

The emperor and the pope had mutually refolved on the deltruction of all who flivnid dare to oppofe the council of Trent. The meeting of it was to ferve as a fignal for taking up arms ; and accordingly its deliberations were fartely begun in 1546, when the Proteflants perceived undoubted figns of the approaching florm, and a formidable union betwixt the emperor and pope, which threatened to crufh and overwhelm them at once. This year indeed there hid heen a new conference at Ratibon upon the old fubject of accommodating differences in religion; but fiom the manner in which the debates were carried on, it phamly ap. pared that thefe differences could cnly be decided in the field of battle. The culuncil of Trent, in the mean time, promulgated their decrees; while the reformed princes, in the diet of Ratifon, protefted againft their authority, and were on that account preferibed by the emperor, who raifed an army to reduce them to obedience. See Father Paul's Hiffory of the Ciouncil of Trent, and our articles Paul (Fither), and Trent.

The elector of Saxuny and the landgrave if Helfe led their forces into Bavaria againft the emperor, atd camonaded his camp at Ingolditalt. It was fuppued that this would bring on an engagement, which would probably have been advantageous to the caufe of the reformed; but this was prevenied, chiefly by the perfidy of Maurice duke of Saxony, who invaded the dominions of his uncle. Divitions were alfo fomented among the confederate princes, by the diflimulation of the emperor ; and France failed in paying the fubfidy which had been prumifed by its monarch: all which fo difcouraged the heads of the Proteflant party, that their army foon difperfed, and the elector of Saxony was obliged to direct his march homewards. But he was purfued by the emperor, who made feveral forced - marches, with a view to deltroy his enemy before he flould have time to recover his vigour. The two armies met near Muhlberg, on the Elbe, on the 24th of April 1547; and, after a bloody athion, the elector was entirely defeated, and himfelf taken prifoner.Maurice, who had fo bafely betrayed him, was now declared elefor of Saxony ; and by his intreaties Philip landgrave of Heffe, the other chief of the Proteflants, was perfuaded th throw himelf on the mercy of the emperor, and to implore his pardon. 'I'o this he confented, relying on the promife of Charles for obtaining forgivenefs, and being rellored to liberty ; but, notwithftaiding thefe expectations, he was unjuftly detained prifiner, by at featdalous violation of the moft folemin convention. It 1 . laid that the emperor ratracted tis promile, and deluded this unhappy prince by the ambiguity of two German words. Hiftory indeed can fcurce afford a parallel to the perfidious, mean-fpirited, and defpotic behaviour of the emperor in the prefent cale. Afier having received in pub. lic the humble fubmifion of the prince on his bnecs, and after having fet him at liberty by a folemn treaty, he had him arrefted anew without any reafon, nay, without any pretence, and kept him clofe prifoner for fever.l years. When Haurice remonftrated againlt this new confinement, the emperor aufwered,
that hel not be imprifoned anew, but only that he fhould be exemped from perperual impriforment ; and, to fupport this afiertion, he produced the treaty, in which his minilters had peridioully foilted eavger gefangnis, which liguifies a " perpctual prifon," intiead of cinigir gefangnis, which fignifies "any prifon." This, howcver, is contelled by fome hiftorians.

The affair of the Proteftants now feemed to Le def. perate. In the diei of Augtburg, which was focn after called, the emperor required the Proteftants 10 leave the decifion of thefe religious difputes to the wiflom of the council which was to meet at Trent. The greatelt part of the members confented to this propofal, being convinced by the powe:ful argumerit of an imperial army, which was at hand to dilpel the darknefs from the eyes of fuch as might otherwife have been blind to the force of Charles's reafoning. However this general fubm.ffion did not produce the effen which was expected frum it. A plague which broke out, or was faid to do fo, in the city, caufed the greatelf part of the bifhops to retire to Bologna; by which means the council was in effe? diflolved, nor could all the intreaties and remonftrances of the emperor prevail upon the pope to re-afemble it without delay. During this interval therefore, the emperor judged it neceffary to fail upon fome method c.f accommodating the religions differences, and maintaining peace uncil the council folong expected thould be finally obtained. With this view be ordered Julius Pelugius bifhop of Naumberg, Michael Sidonius, a creature of the pope, and John Agricola, a native of Ayselben, to draw up a formulaty which might ferve as a rule of faith and worthip, till the council thould be affembled : but as this was only a temporary expedient, and had not the force of a permanent or perpetual infitution, it thence obtained the name of the Interim.

This project of Charles was formed partly with a delign to vent his refentment againft the pope, and partly to anfwer other political purpofes. It contained all the effential doatrines of the church of Rome, though confiderably foftened by the artful terms which were employed, and which were quite different from thofe employed before and after this period by the council of Trent. There was even an affected ambiguity in many of the expreflions, which made them fufceptible of differcnt fenfes, and applicable to the fentiments of both communions. The confequence of all this was, that the imperial creed was reprcbated by b th parties. However, it was promulgated with tics.
great lolennity by the emperor at Aughurg. The elector of Mentz, without even afking the cpinion of the princes, prefent, gave a fanstion to this formula, as if he had been comnilioned to reprefent the whole dict. Many kept filence through fear, and that filence was interpreted as a tacit confent. Some had the conrage to oppele it, and thefe were reduced by force of arms; and the molt deplorable fcenes of bloodfhed and violence were acted throughout the whole empire. Maurice, clenter of Saxony, who had hitherto kept neutral, now affembled the whole of his nobility and clergy, in order to deliberate on this critical atlair. At the head of the latter was Melanohon, whofe word was refpected as a law among the Proteftants. But

H．e ？rnu－ 11 is rean lad not the couraze of Iuther；and was t u：
h．er． il．crefore on all oecations ready to matre costcettions， and io propore filiences of accommociation．In the prote：：chio，theref te，he gase it as his opinion，that

 in．lic da duc．．，that he faw nuration why this book ni：lit not be approwed，adopied，and received，as an authonitaive rale in things that did not teate to the cllemtial puts of rugion，and which he accounted indifferent．But this felemes，inltead of cementing the differences，made them math worle thanever；and paduced a divilion among the Potelants themfives， val：h migint have ovethoum the Retormation en－ tir ly，if the empetor and pore hid feized the oppor－ tutity．

In the year $15+9$ ，the pope（Paul III．）died；and Wh：liceceded by Julius IJI．who，at the repeated fo－ licitations of the emperor，coniened to the reatlem－ biar of a council at 「rent．A diet was agaia held at Anglourg under the camnon of an imperial amm，and Charles latid the matter before the pinces of the em－ pire．Mofl of thore prefent gave their confent to it， itnal among the reft Murice elector of Saxony；who confentel in the following conditions：1．That the foints of doctrine which had already been decided liece，fhould be re－examined．2．That this exami－ nution thould be made in prefence of the Proteftant divines．3．That the Saxon Proteftants thould have a liberty of voting as well as of deliberating in the council．4．That the pope fhould not pretend to pre－ fide in that affembly，either in perfon or by his legates． Thlis declaration of Maurice was read in the diet，and his deputics infited upon its being entered into the re－ gillers which the archbilhep of Mentz obetinately re－ fulect．＇The diet was concluded in the year 1551； and，at its breaking up，the emperor defired the af－ fembled princes and fates to prepare all things for the approaching council，and promifed to ufe his ut－ mof endeavours to procure moderation and harmons， inparatality and charity，in the tranfactions of that af． fermbl）：

On the breaking $u_{p}$ of the diet，the Poteftants took fuch Iteps as they thought moft proper for their own fifety．The Sasons employed Melanction，and the Wurtembergers Brengius，to draw up Confeffions of Faith to be laid before the new council．The Saxon di－ vines，however，proceeded no farther than Nuremberg， howing received fecret orders from Maurice to ftop there：For the elector，petceiving that Charles had formed defigns againt the liberties of the German princes，refolved to take the mof effectual meafures for crufling his ambition at once．He therefore entered with the utmof fecrecy and expedition into an alliance with the king of France，and feverill of the German princes，for the fecurity of the rights and liberties of the empire ；after wlich，affembling a powerful army in 1552，he marched ag．tinf the emperor，who lay with a handful of troops at lufpruck，and erpected no fuch thing．By this fudden and uuforefeen accident Charles was io much difpirited，that he was willing to make peace ：llmoft on any terms．＇The confequence of this was，that he concluded a treaty at lantiau，which by the Proteftants is confidered as the bafis of their religi－ ous liberty．By the firft three articles of this treaty it
wate afrecd，that Matuice and the corifederates fhould Reforma． lay dewn their arms，and lend their tronps to F＂urdinand m：tion． （1）atfill him ：ugaint the Turks；and that the landgrave $\underbrace{\text { amition．}}$ of IIell thould be let at liberty．liy the fourth $i=$ was agreed，that the Rule of Fodith called thee Interim flonuld be ernlidered as nuil and void：that the con－ tonding parties thunict enjoy the free and unditurbed exercife of their religion，until a diet fhould be affem－ bled to determine annicably the prefent difputes（which diet wis to mect in the fpace of（fix montlis）；and that this religions liberty fhould continue always，in cafe it llould be found impollible to come to an uniformity in dotrine and worthip．It was allo determined，that all thofe who hat futfered banilhment，or any other cala－ mits，on account of their having been concerned in the le：grue or watr of Smalcald，fhould be reinltated in their privileges，polleilions，and employments；that the im－ perial chamber at Spire thould be open to the Prote． Itants as well as to the Catholics ；and that there Aould always be a certain number of Lutherans in that high court．－T＇o this peace Albert，marquis of Branden－ burg，refuled to fubfrribe；and continued the war againt the Roman－catholics，committing fuch ravages in the empire，that a confederacy was at laft formed againt him．At the head of this confederacy was Maturice elector of Saxony，who died of a mound he received in a battle fought on the occafion in 1553.

The affembling of the diet promifed by Charles was prevented by various incidents；however it met at Augfourg in 1555，where it was opened by Ferdi－ nand in name of the emperor，and terminated thofe deplorable calamities whicli had fo long defolated the empire．After various debates，the following atts were palled，on the 25 th of September：That the Prote－ Ptants who followed the Confefion of Aughurg fhould Traty of ants who followed the Confention of Aughourg fhould Augtburg．
be for the future confidered as entirely free from the ju－ rifdiction of the Roman pontiff，and from the authority and fuperintendance of the bilhops；that they were left at perfect liberty to enact laws for themfelves relating to their religious fentiments，difcipline，and worfhip； that all the inhabitants of the German empire fhould be allowed to judge for themfelves in religious matters， and to join themfelves to that church whofe doetrine and workhip they thought the molt pure and confonant to the fpirit of true Chriftianity；and that all thofe who fhould injure or perfecute any perfon under reli－ gious pretences，and on account of their opinions， thould be declared and proceeded againt as public ene－ mies of the cmpire，invaders of its liberty，and difturbers of its peace．

Thus was the Reformation eftablifhed in many parts of the German empirc，where it continues to this day ； nor have the efforts of the Popifh powers at any time been able to lupprefs it，or even 10 prevent it from gaining ground．It was not，however，in Germany Aeconnt alone that a relormation of religion took place．Al－the Refor－ moft all the kingdoms of Europe began to open their mation in eyes to the truth about the farne time．The reformed Sweden． religion was propagated in Sweden，foon after Ltu－ ther＇s rupture with the church of Rome，by one of his difciples named Olaus Petri．The zcalous efforts of this miflionary were feconded by Gultavus Varfi， whom the Swedes had raifed to the throne in place of Chiftiern king of Denmark，whofe horrid barbarity lofl lim the crown．This prince，however，was as
prudent．

## R E F

Reforma- prodent as he was zcalous; and, as the minds of the tion.
$\qquad$ Swedes were in a fluctuating late, he wifely avoided all kind of rehemence and precipitation in fpreading the new doctrine. Accordingly, the firt object of his attertion was the influction of his people in the iatcred duetrines of the Holy Scriptures: for which purpofe he invited into his dominions feveral learned Germans, and fpread abroud through the kingdom the Swedifh tranfation of the Bible that had been made by Olaus Petri. Some time after this, in 1526 , he appointed a confercnce at Upfal, between this I eformer and Peter Gallius, a zealous defender of the ancient fuperftition, in which each of the champions was to bring forth his arguments, that it might be feen on which ficle the trath lay. In this difpure Olaus obtained a fignal viftory; which contributed much to confirm Guftavus in his perfuafion of the truith of Luther's doctrine, and to promote its progrefs in Sweden. The following year another event gave the finithing froke to its propagation and fuccefs. This was the affembly of the flates at Wentaas, where Guftavus recoinmended the ductrine of the reformers with fuch zeal, that, after warm debates fomented by the clergy in general, it was unanimoufly refolved that the reformation introduced by Luther fhould have place in Sweden. This refolution was principally owing to the firmnefs and magranimity of Gullavus, who declared publicly, that he would lay down the feeptre and retire from the lingdom, rather than rule a people enflaved by the orders ind authority of the pope, and more controuled by the tyranny of their bifhops than by the laws of their monarch. From this time the papal empire in Sweden was entirely overthrown, and Guitavus declared head of the church.

In Denmark, the reformation was introduced as early as the year 152 I , in confequence of the ardent defire difoovered by Chriftiern II. ot having his fubjects in. ftructed in the doctrines of Luther. This monarch, notwithftanding his cruelty, for which his name has been rendered odious, was neverthelefs defirous of delivering his dominions from the tyranny of the church of Rome. For this purprfe, in the year 1520 , he fent for Martin Reinard, one of the difciples of Carloftadt, out of Saxony, and appointed him profeffor of divinity at Hafnia; and after his death, which happened in 1521, he invited Carloftadt himfelf to all that important place. Carloftadt accepted of this office indeed, but in a fhort time returned to Germany; upon which Chriltiern ufed his utmoft endeav urs to engage Luther to vifit his dominions, l,ut in vain. However, the progrefs of Chriftiern, in reforming the religion of his fubjects, or rather of advancing his own power above that of the clurch, was chocked, in the year 1523 , by a confpiracy, by which he was depofed and banifh. ed; his uncle Frederic, duke of Holftein and Slefwic, being appointed his fucceffor.

Frederic conducted the reformation with much greater purdence than his predeceffor. He permitted the Protellant dictors to preach publicly the fentiments of Luther, but did not venture to change the ellablifhed government and difcipline of the church. However, he contributed greatly to the progrefs of the reforma. tion, by his fuccefsful attempts in favour of religious liberty in an affembly of the itates held at Odenfee in 1527. Here he procured the publication of a famous
ediet, by which every fubjeet of Denmark was decla. Refurmared free either to adhere to the tenets of the church of $\underbrace{\text { tion. }}$ Rome, or to the doctrine of Luther. The papal tyranny was totally deftroyed by his fuccellor Chriflienn III. He began by fupprefling the defpotic authority of the bifhops, and rettoring to their lawful owners a great part of the wealth and poffefions which the church had acquired by various tratagens. This was followed by a plan of religious docीrine, worfhip, and difcipline, laid down by Eugenhagius, whom the king had lent for from Wittemberg for that purpofe; and in 1539 an allembly of the ftates at Odenice gave a folemn findtion to all thefe trandations.

In France alfo, the reformation begatin to make fime In France. progrefs very early. Margarct queen of Navarre, fifter to Francis I. the perpetual rival of Charles V. was a great friend to the new doctrine; and it appears that, as early as the year 1523 , there were in feveral of the provinces of France great numbers of people who had conceived the greateit averfion both to the doctrine and tyranny of the church of Rome; among whom were many of the firft rank and dignity, and even fume of the epifcopal order. But as their number increafed daily, and troubles and commotions were excited in feveral places on account of the religions differences, the authority of the king intervened, and many perfons eminent for their virtue and piety were put to death in the molt barbarous manner. Indeed Francis, who had either no religion at all, or, at beft, no fixed and confiftent fyftem of religions principles, conducted himfelf towards the Protelt.ints in fuch a manner as belt anfwered his private views. Sometimes he relolved to invite Melancthon into France, probably with a view to pleafe his fifter the queen of Navarre, whom he loved tenderly, and who had ftrongly imbibed the Proteftant principles. At other times he exercifed the molt infernal ciuelty towards the reformed; and once made the following mad declaration, That it he thought the blood in his arm was tainted by the Lutheran herefy, he would have it cut off; and that he would not fpare even his own children, if they entertained fentiments contrary to thofe of the Catholic church.

About this time the famous Calvin began to draw the attention of the public, but more efpecially of the queen of Navarre. His zeal expofed him to danger ; and the friends of the reformation, whom Francis was daily committing to the flames, placed him more than once in the molt periluus fituation, from which he was delivered by the interpofition of the queen of Navarre. He therefore retired out of France to Bafil in Swifferland; where he publifhed his Chriftian Inftitutions, and became afterwards fo famous.

Thofe among the French who firf renounced the jurifdisten of the Romith church, are commonly called Lutherans by the writers of thofe early times. Hence it has been fuppofed that they had all imbibed the peculiar fentiments of Luther. But this appears by no means to have been the cafe : for the vicinity of the cities of Geneva, Laufanne, Esc. which had adopted the doctrines of Calvin, produced a remarkable effect upon the French Proteflant churches; infomuch that, about the misdle of this century, they all entered into communion with the church of Geneva. The French Proteltants were called Huguenots* by their ad. *See Huverfaries, guenoto.

一18. fevere, being perfecuted with unparalleled fory ; and though many princes of the blood, and of the fillt noblity, lad embracod ilecir fertinents, yet in no part of the werlld did the relornaces linier fomach $t$. At lat a'l commetions were quelled by the fortitut: and magnanimity of Llenry $\mathbf{1 V}$. Who in tha year 1595 granted all his lubjess full libery of confeience by the fumous ledin of Nomtes, and feemed to have thoroughly cit.rblishad the thermation throughont his dominons. Duding the nimurity of I, ruis XIV. however, his edtet wist rev hed by Cardinal Nazatine, lince which time lac l'rotelant, lawe often been crueily pufecuied; nor wots the frotion of the reformed religion in France at any time do fute as in moth other cuntrics of Europe. kevolution.
In the othe: parts of Earope the opprlition to the clareh of Rome was but fant and amhiguous before tlee diet of Augfonrg. liefore hat deriod, however, it appears from undoubted teftmony, that the dofrine ri Luther had made a contiderable, thongh probably dectet, proglefs through Spain, Hungary, Bohemia, Britain, l'oland, and the Netherlands; and had in all th. fe counties many friends, of whom feveral repaired to Witwmberg, in order to enlarge their knowledge by means of Lather's converiation. Some of thele "untries threw oil the Romifh yoke cnticly, and in rhers a prodigions number of families embraced the prisciples of the reformed religion. It is certair, indeed, and the Roman-catholics them?elres acknowledge it without hefitation, that the Papal doefrines and au. thoricy would have fallen into ruin in all parts of the world at once, had not the force of the fecular arm been employed to fupport the ottering edifice. In the Netherlands particularly, the moft gricvous perfecutions wok place, fo that by the emperor Charles V. upwards of 100,000 were deftroyed, while fill greater cruelties were excrcifed upon the people by his on Ihilip Il. The revolt of the United Provinces, however, and motives of real policy, at laft put a ftop to thefe fusious proseedings; and, though in many provinces of the Netheriands, the eftablihment of the Popifh religion was ftill continued, the Proteftants have been long free of the danger of perfecution on account of their principles.
'Ithe reformation made a confiderable progrefs in Spain and lialy foon after the rupture between Luther and the Roman pontiff. In all the provinces of Italy, but more efpecially in the territories of Venice, Tufamy, and Niples, the fupertition of Rome loft gromm, and great numbers of people of all ranks exprefied an averion to the Papal yoke. 'I'his oecafionch viulent and dangerous conmotions in the kingdom of Naples in the year $15+6$; which, however, were at laft quelled by the united efforts of Charles $V$. and his viceroy Don l'edro di Toledo. In feveral places the pope put a llp to the progrefs of the reformation, by letting loofe the inquifitors; who fpread dreadiul marks of their basburity through the greateft part of Italy. Thefe formidable minifters of fupertition put fo many to death, and perpetrated fuch horrid acts of crwelty and oppreffion, that moft of the reformed confulted their fafety by a voluntary exile, while others returned to the religion of Nome, at leaft in external appearance. But the inquilition, which frighted into the profefion of Popery feveral Proteftants in other parts of Italy,
embld never makic its way intn the kingcom of Naples; Refornanor could cither the authority or intreaties of the pope cngage the Neapolitass to admit even viliting in. quilitors.

In Spain, fever.1 people cmbraced the Proteftant in Spais. religion, no: on'y from the controverlies of Luther, but even from thofe divines whom Charles V. had brought with linn into Germany in order to refute the doctrines of Luther. For thefe doctors im ibed the preiended herefy intead of refiting it, and propaŗated it more or lets on their return home. But the inquilition, which could notain no fooing in Naples, reizncd tiumphant in Spain, and by the molt dreadful methods frightened the people back iato Popery, and Supprefled the defir= of cxchanging their fuperfiti-n for a more rational p!an of religion. It was indeed prefumed that Climles himfel died a proteftant; and it feenas to be certain, that, when the approach of death had difipated thofe fchemes of ambition and grandeur which had fo long blinded him, his fentiments became much more rational and agrceable to Chriftianity than they had ever been. All the eccleflallics who had attended him, as foon as he expired, were fent to the inquifition, and committed to the flames, or put to dealh by fome other method equall rerrible. Such was the fate of Auguftine Cafal, the emperor's preacher; of Conftantine Pontinc, his confefor; of Egidius, whom he hed named to the bifopric of Tortofa ; fi Bartholomew de Caranza, a Dominican, who had been confeffor to King Philip and Queen Mary; with 20 others of lefs note.

In England, the principles of the reformation be- In $1: 40$ gan to be adopted as foon as an account of Luther's land. dostrines could be eonveyed thither. In that kingdom there were ftill great remains of the feet called Lollirds, whofe doctrine refembled that of Iuther ; and among whom, of confequence, the fentiments of our reformer gained grear credit. Henry VIII. king of England at that lime was a vinlent partifan of the church of Rome, and liad a particular seneration for the writings of Thomas Aquinas. Being informed that Luther fooke of his favourite author with contempt, he conceived a violent prejudice againft the reformer, and cven wrote ngaint him, as we have already obferved. Luther did not licfitate at writing againft his majefly, overcame him in argument, and treated him with very little ceremony. The firf Itep towards public reformiti $n$, however, was not taken till :he year 1529. Great complaints had been made in England, and of at very ancient date, of the ulurpations of the clergy; and liy the prevalence of the Lutheran opinions, thefe complaints were now become more general than before. 'The Houfe of Commons, finding the nccalion favourable, palled feveral bills, reftraining the impolitions of the clergy: but what threatened the ecclefianical order with the greateft danger were the fevere reproaches thrown out almoft without oppofition in the houfe agraint the diffolute lives, ambition, and avarice of the prieft, and their continual encroachments on the privileges of the laity. 'I'he bills for regulating the clergy niet with oppofition in the Houfe of Yords; and bifhep Fifher imputed them to want of faith in the Commons, and to a formed defign, proceeding frem heretical and Lutheran principles, of robbing the charel of her patrimony, and overturning the national religion. The Commons, however, complain-

## R E F

R form3- ed to the king, by their fpeaker Sir Thomas Audley, tion. of thefe reflections thrown out againft them; and the
bifhop was nbliged to retract his words.

Though Heary had nnt the bea! idea of rejceting any, even of the noolt abfurd Ronith fuperititions, $y c t$ as the oppreffions of the clergy fuited very ill with the violence of his own temper, he was pleafed with every opportunity of leflening their power. In the parliament of 1531 , he thowed his defign of humbling the clergy in the noft effectual marner. An obfolete ftatute was revived, from which it was pretended that it was criminal to fubnit to the legatine power which had been excrcifed by cardinal Woliey. By this ftroke the whole body of clergy was declared guilty at once. They were to, well acquainted with Hemy's dilpofition, however, to reply, that their ruin would have Leen the certain confequence of their not fubmitting to Wolfey's commifion which had been given by royal authority. Inftead of making any defence of this kind, they chofe to throw themelves on the mercy of their fovcreign; which, however, it colt them is 8,801 . to procure. A confelfion was likewife extorted from them, that the king was protector and fupreme head of the church of England; though fome of them had the dexterity to get a claufe inferted, which invalidated the whole fubmiliion, viz. in fo firr as is permitted by the law of Chrij?.

The king, having thus begun to reduce the power of the clergy, kept no bounds with them alter wards. He did not indeed attempt any reformation in religious matters; nay, he perfecuted molt violently fuch as did attempt this in the leaft. Indeed, the molt elfential article of his creed feems to have been his own fiupremacy; for whoever denied this, was fure to fuffer the moft fevere penalties, whether Proteftant or Papilt. But an account of the abfurd and cruel conduct of this prince, and of his final quarrel with the pope on account of his refufing a dilipenfation to marry Anne Boleyn, is given under the article England, $n^{6} 253$ 292.

He died in 1547, and was fucceeded by his only fon Edward VI. This amiable prince, whofe early youth swas crowned with that wifdom, fagacity, and virtuc, that would have done honnur to advanced years, gave new fpirit and vigour to the Proteftant caufe, and was its brightef crnament, as well as its molt effectual fupport. He encouraged learned and pious men of foreign countries to fettle in England, and addreffed a particular invitation to Martin Bucer and Panl Fagius, whofe moderation added a luftre to their other sirtues, that, by the minifry and labours of thefe eminent ment, in concert with thofe of the friends of the Reformation in England, he might purge his dominions from the fordid fitions of popery, and eftablifh the pure doctrines of Chriftianity in their place. For this purpufe, he iffued our the wifelt orders for the refloration of true re'igion; but his reign was too fhort to accompl:fh fully fuch a glorious purpofe. In the year 1553 , he w:as taken from his loving and afficted fubjects, whofe forrow was incapreflible, and fuited to their lofs. His filler Mary (the daughter of Catharine of Arragon, from whom Henry had been feparated by the famous divorce), a furious bigot to the church of Rome, and a princefs whofe natural character, like the fpirit of her religion, was defpotic and cruel, fucceeded him on the Britilh throne, and impofed anew the arbilint. XVI. itfelf, or tempered by any fentiments of equity or con:paftion. Batbarnus tortures and death, in the $m \cdot l l$ thocking forms, awaited thofe who oppofed ler will, n: made the lealt fand againft the relloration of Popery. And among many cther vilime, the learned and pious Crimmer, archbilhop of Canterbury, who had been ore of the motl illuftious inftruments of the Reformation in E:igland, fell a facrifice to her fury. This odious fcene of perfecution was happily concluded in the year 1558, by the death of the queen, who left no ifiue; and, as foon as her fucceffor the lady Elizabeth afcended the throne, all things allumsd a new and a pleatiorf afpert. This illultrious princets, whofe fentiments, counfels, and projects, breathed a fpirit fuperior to the natural foftnefs and delicacy of her fex, exerted this vigorous and manly fpirit in the defence of opprefled canfience and expiring liberty, breke anew the defpotic yoke of Papal authority and fuperfition, and, delivering her people from the bondage of Rome, eftablithed that form of religious doctrine and ecclefialtical government which ftill lubfifts in England. This religious ellablifhment differs, in fome refpeets, frum the plan that liad been formed by thore whom Edward VI. had employed for promuting the caufe of the Reformation, and approaches nearer to the rites and difipline in former times; thoagh it is widely different, and, in the mof important points, entircly uppofite to the prin. ciples of the Romantierarchy. Sce Encland, $\mathrm{n}^{\circ} 293$, \&c.
The caufe of the reformation underwent in Ireland the fame viciffrudes and revolutions that had attended it in England. When Henry VIII, after the abolition of the Papal authority, was declared fupreme head upona earth of the church of England, George Brown, a native of England, and a monk of the Augultine order, whom that monarch had created, in the year 1535, archbilhop of Dublin, began to act with the utnoit vigour in confequence of this change in the hierarchy. He purged the churches of his diocefe from fupertition in all its various forms, pulled down images, deftroyed relics, abolifhed abfurd and idolatrous rites, and, by the influeace as well as authority he had in Ireland, caufed the king's fupremacy to be acknowledged in that nation. Henry mowed, foon after, that this fupremacy was not a vain title; for he banifhed the monks out of that kingdom, confifcated their revenues, and deftroyed their convents. In the reisn of Edward VI. $11 i l l$ farther progrefs was made in the removal of Popifh fuperititions, by the zealous labours of bilhop Brown, and the aufpicious encouragement he granted to all who exerted themielves in the caufe of the Reformation. But the de:th of this excellent prince, and the acceffion of queen Mary, had like to have changed the face of affairs in Ineland as much as in England; but her defigns were difappointed by a very curious adventure, of which the following account has been copied from the papers of Richard eal nf Corke. "Queen Mary having dealt feverely with the Protefrants in England, about the latter end of her reign figned a commifion for to take the fatme courfe with them in Ireland; and to execute the fame with greater force, the nominates Dr Cole one of the commidioners. This Doctor coming, with the commifion, to Chefter

difappuin:ment of a lopilh dece tor in Irelasd
on his journey, the mayor of that city healing that her majefty was fending a meffenger into lreland, and he being a churchman, waited on the Doenur, who in dif: courif with the mavor taketh rut of a choke bag a leather hos, fayiag urto him, hlere is a conmem $i n$ that
 by that thle. The g wed weman of the lomfe being well alfeted to the P'r it innt religinn, and alfo having a brcher mamed Fo!n Jilucon ls ot the fame, then a cidisen in Dablin, wals mach troubled at the Doenor's wods; lut wathing her convenient time while the mayar twol: his lewe, and the Donor complimented $\because$ in wown the ftaire, the npens the burs, tates the commi: ©on ont, and phaces in lien thereof a meet of p.per with a pack of cerds wrapt up thatein, the knave of a labs being faced uppe:mott. 'lhe doctor coming up whas chan der fapeating nothing of what had been (ante $\rho$ ti up the lons an formerly. The next day going in the vater-fide, wind and weather ferving him, le jat's :owas's Ireland and landed on the gth of Oc ctober $155^{8}$ at Dubin. Then coming to the calle, the L,crd Fitz-IV, iters being lord-deputy, fent for him to come before him and the privy-council; who, conimg in, after he had made a pecech relating upon what account he came over, he jrefents the box unto the lord-deputs; who cauling it to be opened, that the fecretary might read the commiffion, there was nothing lise a pack of cards with the knare of clubs upper. mont ; which not only farted the lorddeputy and council, but the Doctor, who affured them he had a commillion, but knew not how it was gone. Then the lord-depury made anfwer: Let us have another commilion, and we thall thuffe the cards in the meanwhile. The Dofor being troubled in his mind, went away, and returned into England, and coming to the court obtained another commition; but flaying for a wind on the water-fide, news came to him that the queen was dead: and thus God preferved the Proteltants of Ireland." Queen Elivabeth was fo delighted with this fory, which wats relited to her by lord litz-Walter on his return to England, that the fent for Elizabeth Edmonds, whofe hufband's name was Muttcrfod, and gave her a penfion of $\$ 0$ l. during her life.

In Scotland, the feeds of reformation were very carly fown, by feveral noblemen who hadrefided in Germany during the religions difputes there. But fir many years it was fuppreffed by the power of the pope, feconded by inhuman laws and barbarous executions. The mott eminent oppofer of the 1ªpal Juriftiction was John Kinox, 4 dificiple of Calvin, a man of great zeal and invincible surtitase. On atl occalions he raifed the drooping fpilits of the reformers, and encouraged them to go on with their work notwithtanding the oppofition and :reachery of the queen-regent; till at laft in 15 GT , by the affiltance of an Eirglith arny fent by Elizabeth, Popery was in a manner totally extirpated throughout the kingdom. From this period the form of doatrine, worfhip, and difcipline eftablifhed by Calvinat Gereva, has had the afcendancy in Scolland. But for an account of the difficulties which the Scottifh reformers had to Atuggle with, and the manner in which thefe were overcome, \&ec. fec Scotlano.

For further information on the fubject of the reformation in general, we refer our renders to the works of Burnet and Brandt, to Beaufubre's Jiffoire de las Refornation dans t'Emfire, ales L'ats de la Confegion
 1-55, and Mudncim's liccleliallical Hillors. bice alfo Sicidan $D_{i}$ Siulu Relivenis EG Jegallico Ciarolo IF.; Cerfiris Commentarii; :mad father I'atul's hiliory of the Council of 'Trent.

REFRRACTION, in general, is the deviation of a moving bedy from its diseat courfe, nccalioned by the differcnt denlity of the medinm in which it moves; or it i.: a change of direction eccalioned by a hody's falling obliquely out of one medium into another. The word is chiclly made wife of with regard to the rays of light. Sec Optics (Index) at Refration.

REFRANGIBILITY OF Laght, the difpofition of rays to be refracted. The term is: chiefty applied to the difpofition of zay, to produce difieremt colours, according to their different degrecs of efrangibility. Sce Chromiticsam Uptics pajefor.

REFRIGERATIVL, in nocdisine, a remedy which refrethes the inward parts by conling them ; as clytters, ptilans, \&ic.

REFRIGERATORY, in cheminty, a veficl filled with cold water, through whin the worm palfes in diNillation ; the ufe of which is to condenfe the vapours as they pars through the worm.

Cities of REFUGE, were places provided as Afyla, for fuch as againlt thcir will fould happen to kill a man. Of thefe cities there were three on each fide Jordan: on this fide were Kedefh of Naphtali, Hebron, and Schechem ; beyond Jırdan were Bezer, Golan, and Ramoth-Gilead. When any of the Hebrews, or ftrangers that dwelt in their country, happened to fpill the blood of a man, they might retire thither to be out of the reach of the violent attempts of the relations of the deceafed, and to prepare for their defence and jullification before the judges. The manflayer underwent two trials: firf before the judges of the city of refuge to which he had fled; and fecondly before the judges of his own city. If found guilty, he was put to death with all the feverity of the law. If he was acguitted, he was not immediately fet at liberty; but, to infpire a degree of horror againtt even involuntary homicide, he was recondueted to the place of refuge, and obliged to continue there in a fort of banifhment till the death of the high-prieft. If, before this time, he ventured out, the revenger of blood might freely kill him ; but after the high-prief's death he was at liberty to go where he pleafed without molcfation. It was neceffary that the perfon who fled to any of the cities of refuge fhould underfand fome tade or calling that he might not be burthenfome to the imhabitants. The cities of refuge were required to be well fupplied with water and neceffary provifions. They were alfo to be of eafy accefs to have good roads leading to them, with commodious bridges where there was occation. The width of the roads was to be 32 cubits or 48 feet at leaft. It was further requirell, that at all crofs-ways direction-polts thould be erefted, with an infcription poirting out the road to the cities of refuge. The 1 th of Adar, which anfwers to our Felruary moon, was appointed for the city magifrates to fee that the roads were in good condition. No perfon in any of thefe cities was allowed to makc weapons, left the rclations of the deceafed fhould be funniflicd with the means of gratifying their revenge. Deut. xix. 3. iv. 41. 43.; Joth. xx. 7. Three other citics of refuge were conditionally promifed, but never granted. Sce Asvlum.

REGU.

REFUGEES, a term at frit applied to the French Protefants, who, by the revocition of the edict of Nantz, were confrained to fly from perfecution, and take refuye in foreign countries. Since that time, however, it has been cxtended to all fuch as leave their country in times of danger or dittrefs; and hence, fince the American Revolution, the Englifl fiequently heard of American icfugces.

REGALE, a magnificent entertainment or treat, given to ambafidors and other perfons of diltinction, to entertain or do them honour.

It is ufual in Italy, at the arrival of a traveller of eminence, to fend him a regale, that is, a prefent of fweetmeats, frtits, \&ic. by way of refrethment.

REGALI $\Lambda$, in law, the rights and prerogatives of a king. See Prerogative.

Regalia is alfo ufed for the apparatus of a coronation; as the crown, the feeptre with the crofs, that with the dove, St Edward's faff, the globe, and the orb with the crofs, four feveral fivords, \&c. - The regalia of Scotland were depofited in the catlle of Edinburgh in the year 1707, in what is called the Fewol Office. This room was lately opened by fome commiffioners appointed by the king, when the large chelt in which it is fuppofed they were placed was found; but as it has not, that we have heard of, been opened, it is impoffible to fay whether they be there or not. It is very generally thought they were carried to the Tower of London in the reign of Queen Anne; and a crown is there thewn which is called the Scotch crown. We do not believe, however, that that is the real crown of Scotlund; and think it probable that the Scotch regalia are in the chent which was lately found. If they are not there, they mut have been taken away by flealth, and either deftrojed or melted down, for we do not believe that they are in the Tower of London.

Lord of REGALITY, in Scots law. See Law, $n^{\circ}$ clviii. 4 .

Court of REGARD. See Forest-Courts.
REGARDANT, in heraldry, fignifies looking behind; and it is ufed for a lion, or other beaft, with his face turned towards his tail.

REGARDER, an ancient officer of the king's foreft, fworn to make the regard of the foreft every year ; that is, to take a view of its limits, to inquire into all offences and def:ults committed by the forefters within the forell, and to obferve whether all the officers exceuted their refpeslive duties. See ForestLaws.

REGATA, or ReGatta, a fpecies of amufement peculiar to the republie of Verice. This feectacle has the power of exciting the greatelt emotions of the heart, admiration, cathufinim, and fenfe of glory, and the who: train of our beft feelings. The grand regata is only crhibited on particular occafions, as the vilits of foreign princes and kings at Venice.

It is difficult to give a jut idea of the ardnur that the notice of a regata freads among all clatles of the inhabitants of Venice. Proud of the exclufive privilege of giving fuch a fpetacle, through the wonderful local circumltances of their city, they are highly delighted with making preparations a long time before, in order to coniribute ell they can towards the perfection and enjoyment of the feectacle. A thoufand interefts are formed and augmented every day; parties in favour of the different ampetitors who are known; the protection of young
nublemerb given to the gondoliers in wis furvice ; the delire of lionours and rewards in the afpitants : ard, in $\underbrace{\text { Rezata. }}$ the midf of all this, that ingenicus national indully, which awakes the Venetians from th er labitual insulence, to derive advantage from the bufincis and agitation of the monent: all thefe circumftances united give to the numerous inhabitants of this lively city a degree of fpirit and animation which render it during that time a dclightful abode in the eyes of the philofopher and the fratnger. Ciowds of people flock from the adjacent parts, and travellers joffully repair to this feene of gaticty and pleafure.

Alchough it is allowable for any man to go and infcribe his name in the lift of combatants until the fixed number is complete, it will not be amifs to remark one thing, which has relation to more antient times. The Aate of a gondolier* is of much confideration among - Sce GoL-. the poople; which is very natural, that having been the cola. primitive condition of the inlabitarts of this country. But, betides this gencral confickation, there are among them fome families truly diltinguifhed and refpected by their equals, whofe antiquity is acknowledged, and who, on account of a fuccellion of virtuous men, able in their profeffion, and honoured for the prizes they liave carried off in thefe contells, form the body of noble gondoliers; often more worthy of that title than the higher order of nobility, who only derive their honours from the meric of their ancefors, or frem their own riches. The confideration for thofe familics is carried fo far, that, in the difputes frequently arising among the gondoliers in their ordinary palfage of the canals, we fometinies fee a quarrel intantly made up by the fimple interpofition of a third perfon, who has chanced to be ef this reverend hody. They are rigid with refpect to nifalliances in their families, and they endeavour reciprocally to give and take their wives among thofe of thei: own rank. But we muft remark here, with pleafure. that thefe diftinctions infer no inequality of condition, nor adnit any oppreffion of inferiors, being founded folely on laudable and virtuous opinions. Diftintions derived from fortune only, are thofe which always ontrage nature, and often viriue.

In general, the competitors at the great regatas are chofen from among thefe families of reputation. As foon as they are fixed upon for this exploit, they fpend the intermediate time in preparing themfelves for it, by a daily affiduous and fatiguing exercife. If they are in fervice, their mafters during that time not only gise them their liberty, but alfo augment their wages. This cuftom would feen to indicate, that they look upen thems as perfons confecrated to the honour of the nation, and under a fort of obligation to contribute to its glory.

At laft the great day arrives. Their relations alim. ble together : they encourage the heroes, by calling to their minds the records of their families; the women prefent the oar, befeeching them, in an epic tone, to remember that they are the fins of famous men, whofe Steps they will be expected to follow : this they do with as much folemnity as the Spartan women prefented the Thield to their fons, bidding them either return with or upon it. Religion, as practifed among the lower clafs of penple, has its fhare in the preparations for this enterprize. They caufe maffes to be faid; they make vows to fome particular church; and they arm their boats for the conteft with the images of thofe faints who are moll in vogute. Sorcerers are not forgoten

## REG

 1.f: wh.n, cecation. Fur gondoliers who hate lof the sate often dechare, that witchacratit had bien probsifed againt thesi, or certainly they nimll have wen the day. Such a fuppotition prevents a poor fel ow liom thinking ill of himelt; ath upinion that might be favourable whim another time.The courfe is :bout four miles. The boats flatt from a cestain place, run through the great winding cand, which divides the town into swo parts, turn round a pichet, and, coming back the fanse way, go and feize the prize, which is fixed at the acute:t angle of the great canal, on the convex fide, fo that the point of 1. कht may be the more extended, and the prize feized i. the light of the feecators on brth fides.

According to the number if competitors, different baces are periormed in dufferent forts of buats; fome with one nar and others with two. The prizes propofed are four, indicated by four tlags of different colours, with the different value of the prizes marked upon them. Thefe Hags, public and glorious monuments, are the rrizes to which the competitors particularly afpire. But the government always adds to each a genteel fum of money ; befides that the conquacrors, immediately after the vitcery, are furrounded by all the beau mondc, who congratulate and make them prefents; atter which they go, bearing their honourable trephy in their hand, down the whole length of the canal, and receive the :applaure of innumerable feectators.

This grand canal, ever Atriking by the fingulatity and beauty of the building; which border it, is, upon thefe occalions, covered with an infinity of feectators, in all forts of barges, boats, and gondulds. The element on which they move is farcely feen; but the noife of oars, the agitation of atms and bodies in perpetual motion, indicate the feectacle to be upon the water. At certain diftances, on each fide of the thore, are erected little amphitheatres and feaffoldings, where are placed bands of mufic ; the harmonious found of which predominates now and then over the buzzing noife of the people. Some days before a regata, one may fee on the great canal many boats for pleafure and entertainment. The young noble, the citizen, the rich .reizan, mounts a long boat of fix or eight oars; his \%undoliers decorated with rich and fingular dreffes, and the veffel itfelf adorned with various ftuffs. Among the nobles there are always a number who are at a confider. ble expence in thefe decorations; and at the regata itielf exhibit on the water perfonages of mythologic Hory, with the heroes of antiquity in their train, or amufe themfelves with reprefenting the coltumi of difierent mations: in thart, people contribute with a mad fort of magniticence, from all quarters, to this mafquesade, the fivourite diverfion of the Venetians. But diefe great machines, not being the lefs in motion on account of their ornaments, are not merely deftined to grace the fhow : they are employed at the recata, at every moment, to range the people, to proted the courfs, and to keep the avenue open and clear to the goal. The noblity, knecling upon cu?hions at the prow of their weffel, are attentive to thefe matters, and announce their orders to the molt refive, by darting at them little gilded or filvered bulls, by means of certain bows, with which they are furnithed on this occafion. And this is the only appearance of coertion in the Venetian police on thefe days of the greatert tumult : nor is there to be feen, in any part of the city, a body of
guards or patrol, nor cven a gun or a haliett. Tise mildiefs of the nation, its gaiety, its education in the habit of believing that the government is ever awake, that it knows and lees every thing; its refpectril attachment to the body of patricians; the fole afpert of certain officers of the police in their robes, difperled in different places, at once operate and explain that tranguility, that fecurity, which we fee in the midft of the greateft confufion, and that furpriling docility in fo lively and fiery a people. Regattas have been attempted on the rever Thames, but they were but humble imitations of the V'enetian amufement.

REGEL, or Rigel, a fixed far of the firft maronitude, in Orion's left foot.

REGENERATION, in theology, the ate of being born again by a $f_{i}$ iritual bith, or the change of heatt and life experienced by a perton who fortakes a courie of vice, and fincerely cmbraces a life of virtue and piety.

REGENSBURG, or Ratision. See Ratisbon.
REGENT, one who governs a kingdom during the minority or abfence of the king.

In France, the queen-mother had the regency of the kingdom during the minotity of the king, under the title of quem-regent.

In England, the methods of appointing this guardian or regent have been fo various, and the duration of his power fo uncertain, that from hence alone it may be collected that his office is unknown to the common law; and theref te (as Sir Edward Coke fays, 4 inlt. 58.) the fureft way is to have him made by authority of the great council in parliament. The earl of Pembroke by his own authority affumed in very troublefome times the regency of Henry III. whe was then only nine years old; but was declared of full age by the pope at 17, confirmed the great charter at 18, and took upon him the adminiftration of the government at 20. A guardian and councils of regency were named for Edward III. by the parliament, which depofed his father; the young king being then 15 , and not affuming the goven nment till three years after. When Richard II. fucceeded at the age of 11, the duke of Lancafter took upon him the management of the kingdom till the parliament met, which appointed a nominal council to affit him. Henry V. on his death-bed named a regent and a guardian for his infant fon Henry VI. then nine months old : but the parliament altered his dipofition, and appointed a pre ieftor and council, with a fecial linited authority. Buth thefe princes remained in a fate of pupilage till the age of 23. Edward V. at the age of 13 , was recommended by his father to the care of the duke of Gloucefer; who was declared piotector by the privycouncil. The ftatutes 25 Hen. VIll. c. 12. and 28 Hen. VIII. c. 7. provided, that the fuccelfor, if a male and under 18, or if a female and under 16, thould be till fuch age in the governance of his or her natural mother, (if approved by the king), and fuch other c uncellors as his majefty thould by will or otherwife appoint: and he accordingly appointed his 16 executors to have the government of his Ion Edward VI. and the kinglom, which executers elected the earl of Hartford priteqor. The fatutes $2+$ Geo. I1. c. ${ }^{2}+$ in cale the crown thould defeend to any of the children of Frederic late prince of Wales under the age of 18 , appointed the princefs dowager ;-and that of 5 Gco. III. c. 27. in cate of a like defcent to any of his prefent majety's children, empowers the king to name either the

Recgent, queen or princefs dowager, or any defcendant of king $\underbrace{\text { Reggio. George II. sefiding in England;-to be guardian and }}$ regent till the fucceffor attains fuch age, allifted by a council of regency; the powers of them all being exprefily defined and fet down in the ferctal acts.

Recent alfo lignifies a profeifor of arts and fciences in a college, having prpils under his care ; but it is generally reftrained to the lower clafles, as to rhetoric, logic, \&c. thofe of philotophy being called profefurs. In the Englifh univerfities it is applied to Mafters of Arts under five years fanding, and to Doctors under two, as non-regent is to thofe above that tlanding.

REGGIO, an ancient and confiderable town of

## Swin-

## burnc's

Travels iu the Two Sicilies. Italy, in the kingdom of Naples, and in the larther Calabria, with an archbifhop's fee, and a woollen manufactory. It is feated in a delightful country, which
produces plenty of oranges, and all their kindred fruits. The olives are exquifite, and high-favoured. The town, however, can boatt of neither beautiful buildings nor Atrong fortifications. Of its edifices the Gothic cathedral is the only Atriking one, but it affords nothing curious in architecture. The citadel is far from formidable, according to the prefent fyitem of tactics; nor could the city walis make a long refiftance againt any enemy but Barbary corfairs; and even thefe they have net always been able to repel, for in 1543 it was laid in afhes by Barbarofla. Multapha facked it 15 years after, and the defolation was renewed in 1593 by another fet of Turks. Its expofed fituation, on the very threfhold of Italy, and fronting Sicily, has from the earlieft period rendered it lialle to attacks and devaftations. The Chalcidians feized upon it, or, according to the ufual Greek phrafe, founded it, and called the colony Rhegion, from a word that means a break or crack, alluding to its pofition on the point where Sicily broke off from the continerit. Anaxilas oppreffed its libertics. Dionyfius the Elder took it, and put many of the principal citizens to death, in revenge for their having refufed his alliance. The Campanian legion, fent to proted the Rhegians, turned its fivord againft them, maffacred many inhabitants, and tyrannized over the remainder, till the Ro. man fenate thought proper to punifh thefe traitors with exemplary feverity, though at the fame time it entered into league with the revolved garrifon of Meffina. This union with a fet of villains, guilty of the fame crime, proved that no love of juflice, but political reafons alone, drew down its vengeance on the Campanians.It is about 12 miles S. E. of Meffina, and 19 C S. by E. of Naples. E. Long. 16. o. N. Lat. 38. 4.

Reggio, an ancient, handfome, and Arong town of Italy, in the duchy of Modena, with a frong citadel, and a bifhop's fee. It has been ruined feveral times by the Goths, and other nations. In the cathedral are paintings by the greatef mafters; and in the fquare is the ftatue of Brennus, chief of the Ganls. The inhabitants are about 22,000, who carry on a great trade in filk. It was taken by prince Engene in $1_{7} \mathrm{c6}$, and by the king of Sardinia in 1742 . It is feated in a fertile country to the fouth of the Apennines, and to the north of a fpacious plain, 15 miles north-weft of Modena, and 80 fouth eat of Milan. E. Long. 11. 5. N. Lat. 44. 43. - The duchy of this name is bounded on the welt by that o ! Modena, and produces a great deal of filk, and belongs to the duke of Modena, except the marquifate of St Martin, which belongs to a prinie of that rame.

Regiam majestatem. See Law, no civ. jo.
REGICIDE, king-killer, a word chiefly ufed in England in fpeaking of the perfons cor.cersed in the trial, condemation, and cxecution, of king Charles I.

REGIFUGIUM was a feaft celetraied at Rome on the 2 fih of February, in commemoration of the cxpulfion of Tarquinius Superlus, and the abolition of regal power. It was alfo pertormed on thic 26 h of N , y , when the king of the facrifices, or Rex Sacrorum, nffic ed bean flcur and bacon, in the place where the affemblies were held. The facrifice being over, the people hatted away with all fpeed, to denote the precipitate flight of King Tarquir:.

REGIMEN, the regulation of diet, and, in a more general fenfe, of all the non-1naturals, with a view to preferve or reftore hcalih. Sce Abstinenice, Allment, Fond, Diet, Drink, and Medicine.
The vicifitude of exercife and refl forms alfo a necef. fary part of regimen. See Exercise.

It is beneficidl to be at rell now and then, but more fo frequintly to ufe exercife; becaufe inaction renders the body weak and liftefs, and labour ftrengthens it. But a medium is to be oblerved in all things, and too much farigue is to be aroided: for ficquent and violent exercife overpowers the natural ftength, and wattes the bndy; but moderate exercife ought always to be ufed before meals. Now, of all kinds of exercife, riding on horieback is the mof convenient : or if the perion be too weak to bear it, riding in a coach, or at lenit in a litter: next follow fencing, playing at ball, ruming, walking. But it is one of the inconveriences of old age, that there is feldom fufficient Atrength for ufing bodily exercife, hongh it be extremely requifite fo: health: wherefore fridtions with the flefa-brufh are neceflary at this time of life; which fhould be performed by the perfon himelf, if poffible; if not, by his fervants.

Sleep is the fweet foother of cares, :nd refterer of ftrengih ; as it icpairs and rep'aces the waftes that are made by the labours and exercifes of the day. But exceflive fleep has its inconveniences; for it blunts the fenfes, and renders them lefs fit for the duties of liie. The proper time for fleep is the might, when darknefs and filence invite and bring it on: day-fleep is lefs refrefhing; which rulc if it be proper for the multitude to obferve, much more is the obfervance of it neceffary for perfons addicted to literary fudies, whofe minds and bodies are more fufceptible of injuries.

Regimen, in grammar, that part of fyntax, nt confruction, which rcgulates the dependency of words, and the alterations which one necafions in another.

## Recimen for Scamien. Sec Seamen.

REGIMEN1', is a body of men, either horfe, font, or artillery, commanded by a colonel, lieutenant-colonel, and major. Each regiment of foot is divided into companies; but the number of companies differs : though in Britain the regiments are gencrally 10 companies, one of which is always grenadiers, exclufive of the two iudependent companies. Regiments of horfe are commonly ix tronps, but there are fome of nine. Dragoon regiments are generally in war-time 8 troops, and in time of peace but 6 . Each regiment has a chaplain, quarter-mafter, ajjutant, and furgeon. Some Germans reziments conlift of 2000 foot ; and the regiment of Picardy in France cenfifed of 6000 , being $1=0$ companies, of 50 men in each company.

ille upper region commerces from tha tops of the momiraias, and realues to the utmolk limits of the atmonficere. In this region reign a perpetual, equable, calmeifs, clearnefs, and ferenity. The midule region is thit in which the clouds retide, and where meteors are fornted, extending from the estremity (f) the lowet in the tops of the highen mountains. The lowelt refrimen is that in which we breathe, which is bounded by the walation of the furis mass: or by the height to which they robound from the eath. See Atmosphere shi tir.

Therenl RFGIO, in cofmography, is the whole extht of the miverfe, in which is inchuded all the heavenly bodies, and even the nrb of the fixed flars.
A.enentary Rfiton, according to the Arifotelians, is a there terminated by the concavity of the moon's orb, wopreheming the atmofyere of the earth.

Regos, in anatumy a divifion of the human body, obicrw.fe called e.veity, of which anatomith reckon three, viz. the upprer regien, or that of the had; the middle - egis r, that f fthe theras or breaft; and the lower, the ab limen, orbelly: See Anatovy.

Regos, in ancient Rome, was a part or divifion of We city. The regions were only four in number, till Atugus Carat's lime, who divided the city into fouricell ; over each of which he fettled two furveyors, callaf curiteres viarum, who were appointed annually, and took their divilions by lot. Thefe fourteen regions contained four hundred and twenty four ftreets, thirt $y$ ine of which were called greater or royal freets, which began at the gilt pillar that food at the entry of the open place in the middle of the city. The extent of thefe divifions varied greatly, fome being from 12000 or 1,3000 to 33000 feet or upwards in circumference. Authors, however, are not agreed as to the exact limits of each. The curatores viarum wore the purple, had each two lietors in their proper divifions, had flaves under thens to take care of fires, that happened to break out. 'Thes' had alfo two othicers, called denunciatares, in each region to give account of any difirders. Four sicomagifri allo were appointed in each Areet, who touk care of the freets alloted them, and carnied the orders of the city to ach citizen.

REGISTER, a pubic bank, in which are entered and recordrd memoirs, acts, and minutes, to be had recourfe to eccafionally for knowing and proving matiers of fac. Of thefe there are feveral kinds; as,

1. Regiter of deeds in Yorkfhire and Middlefex, in which are resifered all deeds, convey,nese, wills, \&c. that affect any lands or tencments in thofe countics, which are otherwife void againft any fubferguent purchafers or mortgagees, \&cc. but this does not extend to any enpyhold eftate, nor to leafes at a lack-rent, or
where thyy do not exceed z: years. The regitered Reginens memoria's m.ft be ingrolfed on parchment, under the handindteal of fome of the granters or grantecs, attefted by witaclles who are to prove the figniny ar feal. ing of them and the exceution of the deed. But theie regillers, which are contined to two courties, are in sicutand goneral, by which the laws of North Britain are rendered very eafy and regular. Of thefe there are two kinds ; the ene general, fixed at Fidinburgh, under the direction of the lod-reginer ; and the other is kept in the feverd fhires, ftewartries, and regalitics, the clerks of whin are obliged to tranfmit the regifters of their refpective courts to the general regifer.
2. Parifl-segifters are books in which are regifteted the baptifms, marriages, and burials, of each parifh.

Registers were kopt both at Athens and Rome, in which were inferted the names of fuch children as were to be brought up, asfion as they were born. Marcus Aurelius required all free perfons to give in accounts of their children, wiehin 30 days after the birth, to the treafurer of the empire, in order to their being depofited in the tenple of Saturn, where the public acts were kept. Officers were alfo appointed as publie regiters in the provinces, thatre mre might be had to their litts of names, for fettling difputes, or proving any perfon's freedom.
$R_{\text {EGISTER Ships, }}$ in commerce, are vefiels which obtain a permillion either from the king of Spain, or the conncil of the Indies, to traffic in the ports of the Spanith Weil Indics; which are thus called, from their being regiftered before they fet fail from Cadiz for Buenos Ayres.

REGISTERS, in chemiltry, are holes, or chinks with Itopples, contrived in the fides of furnaces, to rcgulate the fire ; that is, to nake the heat more intenfe or remifs, by opening them tolet in the air, or keeping them clofe to exclude it. There are alfo regifters in the feam-engine. See STEqst-Engine.

REGISTRAR, an officer in the Englifh univerfities, who has the keeping of all the public records.

REGIUN, Legium Lepidt, Regium Lepidum, (anc. geog.) ; a town of Cifalpine Gaul, on the Via Atmilia fo called from Rimilius Lepidus, who was conful with C. Flaminius; but whence it was furnamed Regiam is altogether uncertain. Tacitus, relates, that at the battle of Bedriacum, a bird of an unulial fize was feen perching in a famous grove near Regium Lepidum. Now called Reggio, a city of Modena. E. Long. 11. o. N. Lat. 44. +5. See Kegeio.
REGNARD (John Francis), one of the bef French comic writers after Moliere, was born at Paris in 1677. He had fearaciy finithed his Rudies, when an ardent paffion for travelling carried him over the greatelt part of Europe. When he fettled in his own country, be was made a tre:ffurce of Fronce, and lieutenant of the waters and foreft; : ho wrote a great many comedies; and, though naturally of a gay genius, died of chayrin in the 52 d year of his age. His works, confifing of comedies and travels, were printed at Rouen, in 5 vols $12 \mathrm{mo}, 1732$.

REGNIER (Mathurin), the firt French poet who fuccecded in Latire, was born at Chartres in 1573. He was brought up to the church, a place for which his debaucheries rendered him very unfuitable ; and thefe by his own eonfetlion were fo excefive, that at 30 he had
R.agiul: all the iafirmities of age. Yct lic obtained a canonry: in the church of Chartres, with other benefices; and dicd in 1613 . There is a neat Elzevir edition of his works, 121 mo, 1652 , Lecyden; but the mott clegant is that with notes by M. Broffette, 4to, $\mathbf{1 7 2 9}^{729}$, London.

Regier des Marets (Seraphin), a French peet, bonnat I'aris in $163^{2}$. He diltinguithad himfelf carly by his poetical talents, and in 1684 was made perpetual fecretary to the French acadeniy on the death of Me zeray : it was he who drew up all thofe papers in the name of the academy againf Fureticre: the king gave him the priory of Gramment, and he had alfo :mabs bey. He died in 1713, and his works are, French, Italian, Spanifh, and Litin poons, 2 vols; a French grammar; and an Italiantranilation of A nacreon's odes, with fome nther traunations.

REGNUM (anc. geog.), a town of the Regni, a people in Britian, next the Cantii, now Surry, Suifex, and the coaft of Hamphirc, (Camden) ; a town fituated, by the Itinerary numbers, on the confines of the Belgw, in a place now called Ringrwool, in Hampflire, on the rivulet Ayon, maning down from Salifbury, and about ten miles or more diffant from the fea.
REGRATOR, fignifies him who buys and fells any wares or viatuals in the funie market or fair : and regrators are particularly defcribed to be thofe who buy, or get into their hands, in fairs or markets, any grain, fith, butter, cheefe, heep, lambs, calves, fwine, pigs, geefe, capons, hens, chickens, pizeons, conies, or other dead victuals whatfoever, brought to a fair or market to be fold there, and do fell the fame again in the fame fair, market, or place, or in fome other within four miles thereof.

Regrating is a king of buckfry, by which viquals are made deaıer ; for every feller will gain fomething, which mult of confequence enhance the price. And, in ancient times, both the engroller and regrator were comprehended under the word forefaller. Regrators are punifhable by lofs and forfeiture of goods, and imprifonment, according to the firf, fecond, or third offence, scc.

REGENSBERG, a handfome, though fmall town of Swifferland, in the canton of Zurich, and capital of a bailiwick of the fame name, with a frong cafle; feated on a hill, which is part of Mount Jura. There is a well funk through a rock, 36 fathoms deep.

REGULAR, denotes any thing that is agrecable to the rules of art: thus we fay, a regular building, verb, Sc.

A regular figure, in geometry, is one whole fides, and confequently angles, are equal; and a regular figure with three or four fides is commonly termed an equilateral triangle or fquare, as all others with more fides are called regular polygons.

Regular, in a monaftery, a perfon who has taken the vows; becaufe he is bound to ubferve the rules of the order he has embraced.

REGULATION, a rule or order prefribed by a fuperinr, for the proper management of fome affair.

REGULATOR of a WATch, the fmall fpring belonging to the balance; ferving to adjuft its motions, and make it go fater or fower. See Warch.

REGULBIUM, or Regulvium. (Natitia Imperii) ; mentioned nowhere elfe more early: a town of the Cantii, in Britain. Now Reculver, a village on the
coral, near the iland Thanct, towards the: Thames, t.2 fergnins. the north of Canterbury, (Camden).

REGULUS (M. Attilius), a conful during ti.e firt Punic wat: He reduced Brundulium, and in $l_{\text {is }}$ feeond confulthip he tout $G_{4}$ and fink 30 gaileys of the C.rthaginan leet, on the cants of sicily. Aftermards he landed in Africa; and fo rapid was his fuecefs, that in a chorttime he made himfelf mafter of about 200 places of confecuence on the coaft. The Cartharg nians fined for peace, but the conqueror refufed to grant it; ard foon after he was defeated in a bartle by Xant: ippus, and 30,000 of his men were leit on the field of battle, and 55,000 taken prifoners. Regulus was i:a the number of the captives, and he was carried in triumph to Carthage. He was fent by the enemy to R - me, to prop fe an accommudation and an exchange of prifoners; and if his commiffion was unfucceffful, $l:=$ was bound by the moft folemn oaths to return to Carthage without delay. When he came to Reme, Regulus diffuaded lis countrymen from accepting the terms which the enemy propofed; and when his opinion had had dus influence on the fenate, Regulus retired to Carthage agreeable to his ergagements. The Carthaginians were told that their ofers of peace hat been rejected at Rome by the means of Regulus; and therefore they prepared to punith him with the greatelt feverity. His eye-brows were cut, and he was expofed for fome days to the exceffive heat of the meridian fin, and afterwards confined in a barrel, whofe fides were everywhere filled with large iron fpikes, till he died in the greateft agonies. His fufferings were he.rrd of at Rome; and the fenate permitted his widow to infliat whatever punithment fhe pleafed on fome of the molt illuftrious captives of Carthage which were in their hands. She confined them alfo in preffes filled with frarp iron points ; and was fo exquifice in her cruelty, that the fenate interfered, and fopped the barbarity of her punifhment. Regulus died about 251 years befcre Chrift.-Memmins, a Roman, made governor of Greece by Caligula. While Regulus was in his province, the emperor withed to bring the celebrated fatue of Jupiter Olympius by Phidias to Rome, but this was fupernaturally prevented; and according to ancient authors, the thip which was to convey it was deftroyed by lightning, and the workmen who attempted to remove the flatue were terrified away by fudden noifes.- A man who condemned Sejanus.- Rofcius, a man who held the confulfhip but for one day, in the reign of Vitellins.

Regulus, in chemifry, an imperfest metallic fuhftance that falls to the bottom of the crucible, in the melting of ores or impure metallic fubltances. It is the finefl or puref part of the metal ; and, according to the alchemifts, is denominated reg:llus, or litild king, as being the firl-born of the royal metallic blood. According to them, it is really a fon, but not a perfect man ; i.e. not yct a perffet metal, for want of time and proper nourthment. To procure the regulus or mercurial parts of metals, \&c. flus powders are commonly ufed; as nitre, tartar, scc. which purge the fulphureous part adhering to the metal, by attiacting and abforbing it to themfelves.

Regulus of Antimony. See Chemistry, no 1252 -1257; and fee Index there, at Antimany.

Regulus of Arfenic. Sce Chemistry, no 1267, \&c. and 1285-1294. The ancient procefs for making re-
 with two puts ul Diack tus, one part of boras, and one

 ed, a reg. ll 15 wi artanc will be fumsd at the Lo:tom ei
 dolaher. 'Ile iren and coplre employes in this pro. cefs are not iatended, as inthe operaion for tle martial begulus of animonj. to precipitate the anfenic, and to fep $11.1: e^{\text {i }}$ : from dilphur or any ouher iublance f for the white arfsic is pure, and nothing is to be talien fiom i: ; but, cn the contrary, the indiammalnle principle is to le adalal to reduce it to at regnlas. "The trae wie of tha:c :metals in the prefent eparation is to unite with the נeguius of astinic, to give it more body, and to prevent is cmlire dillipation mapours. Hence the addition wi iron, while it procures thefe advantages, has the in. conveniency of altuing the pulity of che regulus : for tlic metallic fubltance obcaincs is a regulas of arfeaic allyse with iron. It moy, however, be putified front thec iron by fublimation in a clode valite ; by which ops1 ation the regulacd arrenical part, which is very volatile, is fublined to the top of the veffel, and is feparated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of rectification the regulus of arfenic does no: cals along with it at certain ynatntity of iron ; for, in greneral, a volatile fubllance railes along with it, in fubitmation, a pitt of any fixed matter with which it happened to be united.

Mr Iramat propofes another melhod, which we believe is preterable to that defcribed. He dirests that whice arlenic thould be mixed with foap. Inkead of the foxp, olive-nil may be ufed, which has been found (1) fucceed well. 'Ple mixture is to be put into a retort (r) gु.alis matrafi, and to be difilled or fublimed with infe, at lisll very moderate, and only fufficient to raife the ril. Astic oils, which are not volatile, cannot be dikilled but by a heat fufficient to burn and decompoic them, the oil therefere which is mixed with the alinnic umdergoes thefe alterations, and after laving denetrated the arfenic thoroughly is reduced to a coal. Wrhen no more oily vapours rife, we may then know that the oil is reduced to coal. Then the fire muft be increafed, and the metallifed arfenic will be foon fub$l: m$ ad to the upper part of the veifel, in the infide of which it will form a metallic cruft. When no more fablimes, the velfel is to be broken, and the adhering ctuft of regulus of arienic is to be feparated. The regulus obtained by this firt operation is not generally perfect, or n:ot entirely fo, as a part of it is always overcharged with fuliginous matter, and another p.irt las not calough of phlogiton; which later part adheres to the inner furface of the crutt, and forms grey or browneryfals. This fublimate muft then be mixed with alefs quantity of oil, and fublimed a fecond time like the firlit and even, to obtain as good regulus as may be made, a third fublimation in a clofe veffel, and without oil, is necullary. During this operation, the wil winch nfes is more fetid than any other cmpyreumatic oil, and is almof infupportable. This fmell certiinily procecds from the arfenic; the fincll of which is excecdingly flrong and difagreeabie when heated.

Regulus of arfenic made by the method we have defribed, and which we confider as the only one which
is pure, hats all the properties of a fermin:etall. It has metalis fravity, ipacity, and lufte. Its colour is whice and livid, it tamifles in the air, is wery brittle, bur much more volatile than any other femmetal. It catily lefes its inflammable principlc, when fublimed in veff. Is in:o which the air hats accefs; the fublimate having the appearance of grey flowers, which by repeated fublimations become entir ly white, and fimilar to white creilalline arfenic. When regulus of arfenic is heated quickly and tirongly in open air, as under a muflie, it burns with a white or bluifh fame, and diffipates in a thick funue, which has a very fe:id fmell, like that of garlic.

Regulns of arfenic may be combined with acids and moft metals. Sce Arsenic, $n^{\circ}$ 17. We fhall oally farther obferve here, that, according to Mr Brandt, in the Swed. (n Memoirs, the regulus of arfenic camnot be united with mercury. Although the phenomena ealibited by white arferic and regulus of affenic in folutions and allays are probably the fame, jet an accisrate comparifon of thefe would deferve notice, efpecially if the regulus employed were well made; for fome dilference mult proceed from the gre:ter or lefs quantity of what in the old chemifry is called phlogifon with which it is united. See Chemistry, $n^{\circ} 1288$, \&ic.

Regule's of Cobalt, is a femimetal latciy difoovered, and not yet perfesty well known. It receives its name from cobalt, becaufe it can only be extrated fiom the mireral properly fo called. The procefs by which this femimetal is obtained, is fimilar to thofe generally ufed for the extration of metals from their ores. The cobalt mult be thoroughly tortified, to deprive it of all the fulphur and arfenic it contains; and the unmetallic earthy and ftony matters muft be feparated by wathing. The cobalt thus prepared is then to be mixcd with double or triple its quantity of black fux, and a little decrepitated fea-falt ; and muft be fufed cither in a forge or in a hot furnace, for this ore is very difficult of iufion. When the fution has been well made, we find upon breaking the crucible, after it has cooled, a metallic regulus coverd with a fcoria of a deep blue colour. The regulus is of a white metallic colour. The furface of its fracture is clofe and fmall-grained. The femimetal is hadd, but b:ittle. When the fufion has been well made, its furface appears to be carved with many convex threads, which crofs each other diverfely. As almonoall cobalts contain alfo bifmuth, and even as mech as of the regulus iteelf, this bifmuth is reduced by the fame operation, and precipitated in the fame manncr, as the regulus of robalt; for alehough thefe two metals are ficquently mixed in the fame mineral, that is, in cobalt, they are incapable of uniting together, and are always found diftinct and feparate from one another when they are melted together. At the bottom of the crucible then we find both regulus of cobalt and bifmuth. The latter, having a greater fpec.fic gravity, is fourd under the former. They may be feparated frem each other by the blow of a hammer: Birmuth may be cafly dilinguifhed from the regulus of cobalt, not only from its fituation in the crucible, but allo by the large lhining facets which appear in its frasture, and which are very different from the clofe athcoloured grain of regulus of cobalt.

This femimental is more difficult of fufion than any
other ; is lefs eafily calcinable, and nuch lefs volatile. Its calx is grey, and more or lefs brown; and when fufed with vitrifialle matters, it changes into a beautiful blue glafs called fmalt. This calx, then, is one of thofe whicl picferve always a part of their inflammable prin. ciple. It is foluble in acids, as the regulus is. This regulus is foluble in vitriolic, marinc, ritrous acids, and in aqua regia, to all which it communicates colours. The folution in vitriolic acid is reddith; the folution in marine acid is of a fine bluifh-grcen when hot, and its colour is almolt totally cffaced when cold, but is cafily recoverable by theating it, without being " obliged to uncork the bottle containing it. This fulution of the calx of regulus of cobalt is the bafis of the fympa. theric ink; for without marine acid this ink cannot be madc. All the folutions of regulus of cobalt may be precipitated by alkalis; and thefe precipitates are blue, which colour they retain wl.en vitrified with the ftrongeft fire.

Not only fympathetic ink, but alfo regulus of cobatt, may be made from the zaffre commonly fold; which is nothing elfe than the calx of regulus of cobalt mixed with more or lefs pulverifed flints. For this purpofe we mult feparate as well as we can the powder of llints from it, by walhing, as M. Beaumé does, and then reduce it with black flux and fea-falt. Regulus of cobalt feens incapable of uniting with fulphur : bet it eafily unites with liver of fulphur; and the union it forms is fo intimate, that M. Beaumé could not fepa. rate thefe two fubftances otherwife than by precipita. tion with an acid.

Many curious and interefting remarks are fill to be difcovered concerning this fingular femimetal, and we may hope to receive further information from the endeavours of chemifts who have undertaken the examination of it. M. Beaumé particularly has made confiderable experiments on this fubject, part of which he communicates to the public in his Courfe of Chemiftry, and from whomwe have borrowed the moft of the above objervations. See Chemistry, $\mathrm{n}^{\circ} 1294$, \&c.

REHEARSAL, in mufic and the drama, an effay or experiment of fome compofition, generally made in private, previous to its reprefentation or performance in public, in order to render the actors and performers more perfect in their parts.

REICHENBERG, in Boh.emia, 95 miles weft of Prague, 205 north weft of Vienna, Lat. 50. 2. E. Long. 12.25 . is only remarkable as the place where the Pruflian army defeated the Auftians on the 2 ff of April 1757. The Auftrian army, commanded by Count Konigfeck, was poited near Reichenberg, and was attacked by the Pruffians under the command of the prince of Brunfwick Bevern. The Pruffians were 20,000, and the Auftrians 28,000: the action began at half after fix in the morring, when the Pruffan lines were formed, and attacked the Autrian cavalry, which was ranged in three lines of 30 fquadrons, and their two wings fuftained by the infantry, which was pofted :mong felled trees and entrenchments. The Auftrians had a village on their right, and a wood on their left, where the; were intrenched. The Pruffian dragoons and grenadiers cleared the intrenchment and wood, and entirely routed the Auftrian cavalry; at the fame time, the rednubts that covered Reichenberg were taken by General Leftewitz; and the Auftrians were entirely Vol. XVI.
defeated. The Pruffians had feven officers and 100 F.in- -1 se men killed; 14 officers and 150 men wounded. The Auftrians had 1000 men killed and wounded; 20 of their officers and 400 men taken prifoncrs. The action: ended at eleven.

REIN-deer, or Tarculus. See Cervus, ${ }^{\circ}$ 4.
REINS, in anatomy, the fame with Kıaieys. Sce Ahatomy, in iol.

Reins of a bridle, are two long flips of leather, fiu. floned on each fide a curb or frafle, which the ride: holds in his band, 10 keep the horfe in fubjection.

Therc is alfo what is called falfe reins; which is a lath of leather, pafled fometimes through the arch of the banquet, to bend the ho:le's necl.

REJOINDER, in law; is the defendant's anfiwe: to the plaintiff's replication or reply. Thus, in the court of chancery, the defendant puts in an aniwer to the plaintiff's bill, which is fometimes alfo called an exception ; the plaintifls aurwer to that is called a replication, and the defendant's anfiver to that a rejoindre.

RELAND (Adrian), an eminent Orientalill, born at Rgp, in North Holland, in 1676 . During thrce years Iludy under Surcnhulius, he made an uncommon progrefs in the Hebrew, Syriac, Chaldee, and Arabic languages; and thefe languages were always his favounite ftudy. In 1701, he was, by the recommendation of King William, appointed prufefior of Ozienta! languages and ecclefiaftical antiquities in the univerfity of Utrecht; and died of the fmall-pox in 1715. H= was diftinguifhed by his modefty, humanity, and leaming; and carried on a correfpondence with the mont eminent fcholars of his time. His principal works are, I. An excellent defcription of Paleftine. 2. Five differtations on the Medals of the ancient Hebrews, and feveral other differtations on different fubjects. 3. An Introduction to the Hebrew Grammar. 4. The Antiquities of the ancient Hebrews. 5. On the Mahometan Religion. Thefe works are all written in Latin.

RELATION, the mutual refpet of two things, or what each is with regard to the other. See MetaPHYSICs, $\mathrm{n}^{\circ} 93, \& \mathrm{cc}$ and 128 , \&ic.

Relation, in geomeiry. See Ratio.
Relation, is alfo ufed for analogy. See Ana. logy, and Metaphysics, p. 529, \&c.

RELATIVE, fomething relating to or refpesing another.

Relative, in mufic. See Mode.
Relative. Terms, in logic, are words which imply relation: fuch are mafter and fervant, hugband and wife, \&c.

In grammar, relative words are thofe which anfiver to fome other word forgoing, called the anteiedent; fuch are the relative pronouns qui, que, quad, \&cc. and in Englifh, who, whom, which, \&c. The word anfwering to thefe relatives is often underfood, as, "I know whom you mean," for " 1 know the perfon whom you mean."

RELAXATION, in medicine, the aft of loofening or flackening ; or the loofenefs or flachaefs of the fibres, nerves, mufcles, \&c.

RELAY, a fuppiy of horfes, placed on the road, and appointed to be ready for a traveller to change, in order to make the greater expedition.

RELEASE, in law, is a difcharge or conveyance of a mari's right in lands or tenements, to another that H
hath
1.3 h thae fisneer ellate in polfilion. The woris ge. reraill ${ }^{\circ}$ whed tharcin are "remifeal, relcaled and for ever ynit-chamed." sind thele seleales may cnure, eithor, 1. By way of enlorging an elute, or erilarger l'eflat: as, if theme be temant for life ce yoats, remainder to anther in fec, and he in remainder releatis all his risht to the partionlat tenant and 1 is heiss, this gives lim the cftute in fee. But in this cate the relefee mult be in $\hat{F}$ liben of lome chate, for the ofeale to work upon; $\hat{1}$ or if thete be letree for years, and, belore the enters and is in poffefron, the lellurreleates to him all his right in the reverion, fuch retcafe is wiol for want of prithion in the relelies.
 whes one of two coparceners sleafeih all his right to the other, this pate:l the fee-limple of the whole. And, in both theis cares, there nult be a privity of eftate betwecn the redellor and releliee; that is, onc of their efates mult be fo related to the other, as to make but one and the fame cilate in law. 3. by way of pajerg a risht, or mitter le drcit: ats if a man be dilfelfed, and releafe:h to his dilfeitor all his right; hereby the difeifor acquires a new right, which changes the qiality of his eftute, and renders that lawful which before vas tortious. 4. By way of catinguifiment: d.s if my tenant for life makes a leafe to $A$ for life, remonder to $B$ and his heirs, and I releafe to $A$; this extinguitios my right to the reverfion, and thall enure to the advantage of B's remainder as well as of A's particnlar eltate. 5: By way of entry and feoffmen: as if there be two joint diffeifors, and the diffcifee releafes to one of them, he fhall be fule feifed, and thall keep out his former companion; which is the fame in effert as if the diffeifee had entered, and thereby put an end to the diffifu, and afteswards had enfeoffed one of the diffeifors in fee. And hereupon we may obferve, that when a man has in himfelf the poffefion of lands, he muft at the common law convey the freehold by feoffment and livery; which makes a notoriety in the country: but if a man has only a right or a fature interell, he may convey that right or intereft by a mere releafe to him that is in poffefion of the land: for the occupancy of the releffee is a matter of fufficient notorietv already.

RELEVANCY, in Scots law. See LAw, No clusavi. $4^{8 .}$

RELICS, in the Romifh church, the remains of the bodies or clothes of faints or martyrs, and the inalruments by which they were put to death, devoutly preferved, in honour to their micmory; kiffed, revered, and carried in procefion.

The refpect which was jufly due to the martyrs and teachers of the Cliritian fath, in a fow ages increafed almoft to adoration; and at length adoration was really paid both to devarted faints and to relics of holy men or holy things. The abufes of the church of Rome, with refpect to relics, are very flagrant ind notorious. For fuch was the rage for them at one time, that, as F. Mabillon a Benedidine jully complains, the altars were loaded with fufpected relics; numerous fpurious ones being everywhere offered to the piety and devotion of the faithful. He adds, too, that bones are often confecrated, which, fo far from belonging to fuints, probably do not belong to Chriftians. From the catacombs numerous relics have been taken, and yet it is
not known who were the perfons interred therein. In Relict. the the century, relics were tried by fire, and thofe which did not confume were reckoned gennine, and the ic not. Relies were, and nill are, preferved on the altars whercon mafs is celebrated: a fquare hole being made in the middle of the altar, big cnongh to receive the hand, and leercin is the relic depotited, being firt wrapped in red filk, and incloted in a leaden box.

The Romanifs plead antiquity in behalf of relics: For the Manichees, out of hatred to the fleth, which they confidered as an evil principle iefuled to honour the relics of fints; which is reckoned a kind of prouf that the Catholics did it in the firft ages.

We know, indecd, that the touching of linen eloths an relics, frem an opinion of fome extrdordinary vietue dcrived theretrom, was as ancient as the firt ages, the: being a bole made in the coftins (f the to martyrs at Comitantinople exprefsly for this purpofe. The ho. nouning the relics of faints, on which the church of ilome afterwards lounded hel fuperititions and lucrative ufe of them, as objests of devotion, as a kind of charms or amplets, and as inftruments of pretended miracles, appears to bave originated in a very ancient cuftom, that prevailed among Chritians, of aflembling at the cometerics or burying-places of the martyrs, for the purpore of commemorating them, and of performing divine worfhip. When the profeflion of Cluriltianity obtained the protection of the civil government, under Confantine the Great, fately churches were erected over their fepulchres, and their names and memories were treated with every poffible token of affection and refpect. This reverence, however, gradually excceded all reafonable bounds; and thofe prayers and religious fervices were thought to have a peculiar fanctity and virtue, which were performed over their tombs. Hence the practice which afterwards obtained, of depofiting relics of faints and martyrs under the altars in all churches. This practice was then thought of fuch importance, that St Ambrofe would not confecrate a church becaufe it had no relics; and the council of Conftantinople in Trullo crdained, that thofe altars fhould be demolifhed under which there were found no relics. The rage of procuring relics for this and other purpofes of a fimilar nature, became fo exceffive, that in 386 the emperor Theodofius the Great was cibliged to pais a law, forbidding the people to dig up the bo. dies of the martyrs, and to traffic in their relics.

Such was the origin of that refpect for facred relics, which afterwards was perverted into a formal worlhip of them, and became the occafion of innumerable proceffions, pilgrimages, and miracles, from which the chursh of Rome hath derived incredible advantage.In the end of the ninth century, it was not fifficient to reverence departed faints, and to conbide in their interceffions and fuccours, to clothe them with an imaginary power of healing difeafes, working miracies and delivering from all forts of calamities and dangers ; their bomes, their clothes, the apparel and furniture they lad polfeffed during their lives, the very ground which they had touched, or in which their putrefed carcafes were laid, were treated with a fupid veneration, and fuppofed to retain the marvellous virtue of healingrall diforders both of body and mind, and of defending fuch as porfelfed them againft all the aflaults and devices of the de*

Relice. Rercs. vil. The confequence of all this was, that every one was eager to provide hinnelf with thefe falutary remedies; confequently great numbers undertook fatiguing and perilous voyages, and fubjected themfelves to all forts of hardihips ; while others made ufe of this delufion to accumalate their riches, and to impofe upon the mife.able multitude by the molt impious and fincking inventions. As the demand for relics was prodigious and univerfal, the clergy employed the utnont dexterity to fatisfy all demands, and were far from being nice in the methods they ufed for that end. The bodies of the faints were fought by fafting and prayer, inflituted by the pricf in order to obtain a divine anfwer and an infallible direction, and this pretended direction never failed to accomplifh their defires; the holy carcafe was always found, and that always in confequence, as they impioully gave out, of the fuggeftion and infpiration of God himielf. Each dicovery of this kind was attended with excellive demorftrations of joy, and animated the zeal of thefe devont feekers to enrich the church Aill more and more with this new kind of treafure. Many travelled with this view into the Eaftern provinces, and frequented the places which Chrift and his difiples had honoured with their prefence, that, with the bones and other facred remains of the firft heralds of the gofpel, they might comfort dejected minds, calm trembling confciences, fave finking ftates, and defend their inhabitants from all forts of calamities. Nor did thefe pious travellers return home empty ; the craft, dexterity, and knavery of the Greeks, found a rich prey in the Atupid credulity of the Latin relic-hunters, and made a profitable commerce of this new devotion. The latter paid confiderable fums for legs and arms, Akulls and jaw-bones (feveral of which were Pagan, and fome not human), and other things that were fuppofed to have belunged to the primitive worthies of the Chriftian church; and thus the Latin churches came to the poffeffion of thoie celebrated relics of St Mark, St James, St Burtholomew, Cyprian, Pantalcon, and others, which they fhow at this day with fo much oftentation. But there were many who, unable to procure for themfelves thefe fpiritual treafures by voyages and prayers, had recourfe to violence and theft ; for all forts of means, and all forts of attempts in a caufe of this nature, were confidered, when fuccefsful, as pious and acceptable to the Supreme Being.Befides the arguments from antiquity to which the Pafilts refer, in vindication of their worlhip of relics, of which the readermay form fome judgment from this article, Bellarmine appeals to Scripture in fupport of it, and cites the following paffages, viz. Exod. xiii. 19.; Deut. xxxiv. 6.; 2 Kings xiii. 21.; 2 Kings xxiii. 16, 17, 18. ; Ifaiah xi. 10. ; Matthew xi. 20, 21, 22.; Acts v. 12-15.; Actsxix. it, 12. See Popery.

The Roman Catholics in Great Britain do not acknowledge any worlhip to be due to relics, but merely a high veneration and refpect, by which means they think they honour God, who, they fay, has often wrought very extraordinary miracles by them. But, however proper this vencration and refpect may be, its abufe has been fo great and fo general, as fully to warrant the rejection of them altogether.

Relics are forbidden to be ufed or brought into England by feveral ftatutes; and juftices of peace are empowered to fearch houfes for popifh books and relics,
which, when found, are to be defaced and buint, \&ic. 3 Jac. I. cap. 26.

RELIC'I, in law, the fame with Widow.
KELIEF (Relevamen; but, in Demefday, Releratio, R(eviam), fignifies a conain fum of money, which the tenant, holding by knight's fervice, grand ferjeanty, or other tenure, (for which homage or legal fervice is due), and being at full age at the death of his ar:ceftor, paid unto his lord at his entrance. Sce PrIMER.

Though reliefs had their original while feuds were only life-eftates, yet they continued after feuds became hereditary; and were therefore looked upon, very juftly, as one of the greatelt grievances of tenure: efpecially when, at the firft, they were mercly arbitrary and at the will of the lord; fo that, if lie pleared to demand an exorbitant relief, it was in effect to difinherit the heir. 'The Englifh ill brooked this confequence of their new-adopted policy, and there. fore William the Conquet or by his laws of certained the relief, by drecting (in imitation of the Danilh lieriots), that a certain quantity of arms, and habiliments of war, fhould be paid by the earls, barons, and vavafours refpectively; and, if the latter had no arms, they fhould pay roos. William Rufus broke through this compofition, and again demanded arbitrary uncertain reliefs, as due by the feodal laws; thereby in effect obliging every heir to new-purchafe or redeint his land: but his brother Henry I. by the charter be-fore-mentioned, reftored his father's law ; and ordained, that the relief to be paid fhould be according to the law fo eftablithed, and not an arbitrary redemption. But afterwards, when, by an ordinance in $27 \mathrm{Hen}. \mathrm{II}$. called the affife of arms, it was provided, that every man's armour fhould defcend to lis heir, for defence of the realm, and it thereby became impracticable to pay thefe acknowledgments in arms according to the laws of the Conqueror, the compofition was univerfally accepted of 100 s , for every knight's fee, as we find it ever after eitablifhed. But it mult be remembered, that this relief was only then payable, if the heir at the death of his anceftor had attained his full age of 21 years.

To RELIEVE the GUaxd, is to put freth men upon guard, which is generally every 24 hours.

To Relieve the Trenches, is to relieve the guard of the trenches, by appointing thofe for that duty who have been there before.
T. Relieve the Sentrics, is to put frefh men upon tlat duty from the guard, whieh is generally done every two hours, by a corporal who attends the relief, to fee that the proper orders are delivered to the foldier who relieves.

RELIEVO, or Relief, in Sculpture, \&c, is the projecture or ftanding out of a figure which arifes prominent from the ground or plane on which it is forred; whether that figure be cut with the chiffel, moulded, or calt.

There are three kinds er degrees of relievo, viz. alto, baffo, and demi-relievo. The alto-relicvo, called alfo baut-relief, or bigh-reliceo, is when the figure is formed after nature, and projects as much as the life. Bafforelievo, bafs-relief, or low-relievo, is when the work is raired a little from the ground, as in medals, and the frontifpieces of buildings; and particularly in the hifto-

## K EI.

## R E L

Krlievo, res, fentorns, polinges, and other ornanants of friezes. 1:chater. Demi-relieren is when one half of the figure rifes from the plane. When, in a ballo-reliew, there are parts that flind clear "ut, detact:ed from the ielt, the work is called a derniobarit.

In architecture, the selievo or projequre of the ornaments ought always to be proportioned to the magni:Hd= of the building it adoras, and to the difance at which it is to be viewel.

Relievo, or Reigf, in painting, is the degree of boldnels w in which the thgures feem, at a due dillance, to fiand out tron the cround of the pointing.

The relievo depends much upon the depth of the 1hsiow, and the ftrength of the light; or on the heighte of the different colours, ocidering on one another; and particularly on the differeace of the colour of th: figure from that of the ground: thus, when the light is fo dispored as to make the nearett parts of the figure advance, and is well difufed on the manes, yet inenfibly diminulhing, and terminating in a large fpacius thadow, brought of infenfibly, the relievo is laid to be bold, and the clair oblcure well underitood.

- De Natu- RELIGION (Religio), is a Latin word derived, ra Deoruna accordireg to Cicero ", from religere, "to re-confider;" lib. 2. §28, but according to Servius and moft modern grammari-

Religion defined; ans, from relicare, "to bind falt." The reaton afligned by the Roman orator for deducing religio from relego, is in thefe words, "qui autem omnia, qux ad cultum deorum pertinerent, diligenter retractarent, et tanquam relegerent, fuat dicti religiofi ex relcgendo." The reafon given by Servius for his derivation of the word is, "quod mentem religio religet." If the Ciceronian crymelogy be the truc one, the word religion will desote the diligent ftudy of whatever pertains to the worlhip of the gods; but according th the other derivation, which we are inclined to prefer, it denotes that obligation which we feel on our minds from the relation in which we Aand to fome fuperior pnwer. In either cafe, the import of the word religion is different from that of theolozy, as the former fignities a number of practical duties, and the latter a fyllem of fpeculative truths. Theology is therefore the foundation of religion, or the fience from which it fprings; for no man can fudy what pertains to the worlhip of fuperior powers till he believe that luch powers exift, or feel any obligation on his mind from a selation of which he knows nothing.

This idea of religion, as difinguithed from theology, comprehends the duties not only of thafe more relined and consplicated fyetems of theilm or polytheifm which have prevailad anongeg civilized and enlightened dions, fuch as the polytheilin of the Greeks and Rnmans, and the theifm of the Jews, the Mahometans, atad the Chrillians ; it combreliends cvery fentiment of whigation which human beings have ever conceived themfelves under to fuperior powers, as well as all the forms of worlhip which have ever been practifed through the world, however fantaftic, inmoral, or abfurd.

When we turn otar cycs to this featute of the human character, we find it pecnliarly intercfing. Mankind are diftinguithed from the brutal tribes, and elevated to an higher rank, by the rational and moral faculties with which they are endowed; but they are fill more widely dilinguilied from the inferior cration, and more high-
ly ex.lled above them, by being made capable of reijgious notiuns and religious fentiment:. The flightef knowledge of hiftors is fufficient to inform us, that religion has ever had a powerful influence in moulding the fentiments and manners of men. It has fometimes diznified, and fometimes degraded, the human character. In one region or age it has been fayourable to cirilization and refinement; in another, it has occalionally cramped the genius, depraved the motals, and deformed the manners of men. The varistic's of religion are innumerable; and the members of every dillinat lest mult view all who differ from them as more or lefs miltaken with refped to the moft important concerns of man. Religion leems to be congenial to the heart of man ; for wherever hum on fociely fubfits, there we are certain of finding religious opinions and fentiments.

It muft, therefore, be an important fubject of fpecu. Thres lation to the man and the philofopher to confider the queftions origin of religion; to inquire, How fir religion in genc- concerning ralhas a tendency to promote or toinjure the order and religıon. happinefs of fociety ? and, above all, to examine, What particular religion is belt calculated to produce an happs influence on human life ?

We flall endeavour to give a fatisfactory anfwer to each of thefe queftions, referving to the article Treology the confideration of the digmas of that particular religion which, from our prefent inquiries, fhall appear to be true, and to have the happielt influence on human life and manners.
I. The foundation of all religion refts on the belicf of the ${ }^{5}$ of the exiftence of one or more fuperior beings, who fource or govern the world, and upon whom the happinels or nii- foundation fery of mankind ultimately depends. Or this belief, as of religion. it may be faid to have been univerfal, there feem to be but threc fources that can be conceived. Either the image of Deity muft be Itamped on the nind of every human being, the favage as well as the fage; or the founders of focieties, and other eminent perfons, tracing by the efforts of their own reaion vifible effeds to invifible caufes, muit have difcovered the exiftence of fuperior powers, and communicated the difcovery to their alfociates and followers ; or, laftly, the univerfal belief in fuch pewers mutt have been derived by tradition from a primæval revelation, communicated to the progenitors of the human race.

One or other of thefe hypothefes muft be true, be-It does not caufe a fourth camot be framed. But we have elfe- arife from where (Polythbism, $n^{\circ}$ 2.) cxamined the reafoning an original which has been employed to eftablifh the firf, and Thewn that it proceeds upon falfe notions of human nature. We frould likewife pronounce it contrary to fact, could we believe, on the authority of fome of its pations, who are not athamed to contradic one another, that the Kamtfchatkans, and other tribes, in the lowell ftate of reafoning and morals, have no ideas whatever of Deity. We proceed, therefore, to confider the fecond hypothefis, which is much more phufible, and will bear a itrioger ferutiny.

That the exifence and many of the attributes of the Nor from Deity are capable of rigid demonftration, is a truth reafoning which cannot be controverted either by the philofopler or the Chriftian ; for "the invifible things of Him from the creation of the world are clearly feen, being underllood by the things that arc made, even His eternal power and Godhead," (fee Metarbysics, Part III.
chap.

## R E L

 would be rafh to infer, either that every truth for which, when it is knowr, the ingenuity of man can frame a demonftration, is therefore difoz cralle by human fagacity, or that all the truths which have been difcovered by a $N_{\text {cuton }}$ or a Locke migl:t therefore have been difcovered by untaught barbarians. In mathematical fcience, there are few demonfrations of eafier comprehention than that given by Euclid, of the theorem of which Pythagoras is the reputed author; yet no man ever dreamed that a boy capable of being made to undertand that theorem, muit therefore have fagacity equal to the fage of Samos; or that fuch a boy, having never heard of the relation between the hypothenufe and other two fides of a right angled triangle, would be likely to difcover that the iquare of the former is precifely equal to the fum of the fquares of the latter. Juft io it feems to be with the fundamental truths of theology. There can hardly be conceived a demonifration leis intricate, or more conclufive, than that which the man of fcience employs to prove the exiltence of at leaft one God, poffeffed of boundlefs power and perfect wifdom. And could we fuppole that the human race had remained without any knowledge of God in the world, till certain lucky individuals bad by forne means or other made themfelves mafters of the rules of logic, and the philofophy of caufes, there can be no dcubt but that there indiriduals might have difcovered the exiftence of fuperior powers, and communicated their dicovery to their affociates and followers. But this fuppofition cannot be admitted, as it is contradifted by the evidence of all hiftory. No nation or tribe has ever been found, in which there is not reafon to believe that fome notions were entertained of fuperior and invifible powers, upon which depends the happinefs or mifery of mankind: and from the moft authentic records of antiquity, it is apparent that very pure principles of theifm prevailed in fome nations long before the rules of logic, and the philofophy of caufes, were thought of by any pcople under heaven.

The furpofition before us is inadmilfible upon other accounts. Some modern philofophers have fancied that the original progenitors of mankind were left entirely to themfelves from the moment of their creation; that they wandered about for ages without the ufe of fpeech and in the loweft Atate of favagifm; but that they gradually civilized themfeives, and at laft fumbled upon the contrivance of making articulate founds fignificant of ideas, which was followed by the invention of arts and fciences, with all the bleffings of rcligion and legiflation in their train. Dut this is a wild feverie, inconfitent wi.h the phenomena of human nature.

It is a well known fact, that a man blind from his birth, and fuddenly made to fee, would not by means of his newly acquired fenfe difeern either the magnitude or figure or dittance of objeqts, but would conceive every thing which communicated to him vifible fenfations as infeparably united to his eye or his mind (See Metaphysics, $n^{0}$ 49-53). How long his fenfe of fight would remain in fueh an imperfect fate, we cannot pofitively fay; but from attending to the vifible fenfations of infants, we are confident that weeks, if not months, elapfe before they can diftinguifh one thing from another. We have indeed been told, that Chefelden's famous paticnt, though he was at firt in the fate which
we have deferibed, learned to diftirguifn objects ha Kelipion. fight in the courfe of a few hours, cr at the mof of a feiw days; but admitting this to a certain extent to be true, it may eafily he accounted for. The difeafe called a catarag feldom occafions total blindnefs; but let us fuppofe the ejes of this man to have been fo completely dimmed as to communicate no fenfetion whatever upon being expofed to the rays of light; nill we mult reniember that he had long polfeffed the power of loco-motion and all his nther fenfes in perfection. He was therefo:e wcll acquainted wih the real, i. e. the tangible ragritude, figure, and dittance of many cbjeets; and having been often told that the things which he touched would, upon his acquifition of fight, communicate new fenfations to his mind, differ:ng from each other according to the diftance, figure, and magnitude of the ohjeets by which they were occafioned, he would foon learn to infer the one from the ather, and to difingu:th near objects by means of his fighth.

The progenitors of the human race, however, it left to themfelves from the moment of their creation, h:d not the fame advantages. When they firf opened their eyes, they had neither moved, nor handled. nor heard, nor fmelled, nor tafted, nor had a fingle idea o: notinn treafured up in their memories; but were in all thefe refpects in the flate of new-born infants. Now we fhould be glad to be informed by thofe fages who have conduted mankind through many generatiuns in which they were mutun et turpe pecus to that happy period when they invented language, how the fillt men were taught to diftinguifh objects by thcir fenfe of fight, and how they contrived to lite till this molt neceflary faculty was acquired ? It does not appear that men are like brutes, provided with a number of inftincts which guide them blindtold and without experience to whatever is neceffary fir their own prefervation (fee Instinct) : On the contrary, all voyagers tell us that, in flrange and unimhabited countries, they dare not venture to talte unknown fruits unles they perceive that thefe fruits are eaten by the fowls of the air. But without the aid of inftinat, or of fome other guide equally to be depended upon, it is not in our power to conceive how men dropt from the hands of their Creator, and left from that inflant wholly to themfelves, could move a fingle fcp without the moft imminent danger, or even tiretch out their hands to lay hold of that food which we may fuppofe to have been pl:aced within their reach. They could not, for many days, ditinguifh a precipice from a plame, a rock from a pit, or a river from the meadows through which it rolled. And in fuch circumitances, how could they poffibly exif, till their fenfe of fight had acquired fuch perfection as to be a fufficient guide to all their meceffiry motions? Can any confiltent theif fuppofe that the God whofe goodnefs is fo confpicuoufly difplayed in all his works, would leave his noblett cre iture on eaith, a creature for whofe comfort alone many other creatures feem to have been formed, in a fituation fo forlorn as this, where his inmmediate defruetion appears to be inevitable? No! This fuppofition camnot be formed, becaufe mankind fill exift.

Will it then be faid, that when God formed the firlt But fromz men, he not caiy gave them organs of fenfation, and an origina! fouls capable of arriving by difcipline at the exercife of revclation. reafcn, but that be alio impreffed unon their minds indequate

## REL

 1. Iacmat, at ance to their utmol pofible atate of peres n : the ita thent infantumeunfly the laws of reatur-
 b:atch of wext hamblyse? 'T'his is indeed our own Coinian: and it is pericetly agrecable to what we are tu the by the IFibrew lawgiver. When God had ifined Aban and Exe, Moles does mot liy that he If them to ecquite by fluw degrees the ufe of thair finere:ml reuf aing powers, and to diftinguifh as they could trats that wela fatury from thote that were po:tomas. No: he placed then in a garden where every tree but one bore truit fit for food; he warned then porticulaty agrint the truit of that tree: he b. Ou ght befure then the varions iminals which roamed tha ugh the garden; he arranged thefe animals into their proper ganera and fpecies; and by teaching Adam to give then names, tie communicated to the tirlt pair t.ie clements of langu:are. 'Thais condefemfion appears in cvery refpent worthy of perfeat benevolence; and indeed without it the helplefs man and woman could not have lived one whole week. Bar it cannot be fupp. fed, that amidnt fo much ufeful infrustion the gracinus Creator would negleet to communicate to his rafional creatures the knowledge of himfelf; to inform trem of their own origin, and the relation in which they food to him; and to fate in the plaineft terms the dusies incumbent on them in return for fo much goodnel's. ted, cannct be certainly known. It may have been in either of the following ways conceivable by us, or in o:hers of which we can form no conception. God may have nitraculcully fored the minds of the firft pair with adequate ideas and notions of fenfible and intellectual objects; and then by an internal operation of his own Spat have enabled them to exert at once their rational tavulties fo as to difcover his exifence and attributes, together with the relation in which as creatures they nood to him their Almighty Creator. Or, after rencering them capable of ditinguifhing objects by means of thent tenfes, of comparian their ideas, and uriderfanding a language, he may have exhibited himfelf under iome fenlible emblem, and conducted them by degrees from one branch of knowledge to another, as a fchoolmafter condukts his pupils, till they were fufficiently aiquainted with every thing relating to their own happinefs and duty as rational, moral, and religious, crcatures. In determining the queftion before us, it is of no importance whether infinite wifdom adopted either of thefe methods, or fome other different from them hoth which we cannot conceive. The ordinary procefs in which men acquire knowledge is, by the laws of their mature, extremely tedious. They cannot reafon before their minds be flored with ideas and notions; and they cannot acquire thefe but through the medium of their
rende:ed then: capabie of exerting their natural faculties, to as, by tracing efle? his being and attributes, he revealed himetf to then as ce: tainly as he did afterwards to Mofes, whento him he condetcended to speak face to fin.e.
If this reafoning ba admitied as fair and conclufive, such a reasd we appochend that the principles on which it pro- velation ceeds canot be conlidered as ill-founded, we have ad- mutk natuvanced io far as to prove that mankind muft have been rally be originally enlightened by a revelation. But it is farce necelfiry to blerve, that this revelation mut have been bandid down through fucceeding generations. It conld not fail to reach the era of the deluge. It is not abfurd to fuppoie, that he who falie from heaven to Adam, fake alfo to Noah. And both the revelation which had been homded down to the poltdeluvian patriarch by tradition, and that which was communicated immediately to himfelt, would be by hun made known to has defcendants. "Ihus it appears almof impoflihle that fome part of the religious fentiments of mankind thould not have been derived from tevelation; and that not of the religious fentiments of one particular family or tribe, but of almoft all the nations of the earth.
This conclufion, which we have deduced by fair rea-The autho foning from the benevolence of God and the nature of rity of the man, is confirmed by the authority of the Jewifh and Chriftian Scriptules, which are entitled to more implicir credit than dll the other records of ancient hifJewid and Chrifian fcripeures, \&c. tory.
When we review the internal and external evidence of the authenticity of thefe facred books, we cannot for a moment helitate to receive them as the genuine suord of God. If we examine their internal character, they every where appear to be indeed the voice of Heaven. The creation of the world-the manner in which this globe was firt peopled-the deluge which fwept away its inhabitants-the fucceeding views of the fate of mankind in the uext ages after the deluge-the calling of Abraham-the legillation of Mofes-the whole feries of events which befel the Jewifh nation-the pro-phecies-the aprearance of Jefus Chritt, and the promulgation of his gofpel, as explained to us in the Scrip-tures-form one feries, which is, in the highel degree, illuftrative of the power, wifdom, and groodnefs of the Supreme Being.

While it muft be allowed that the human mind is ever prone to debafe the fublime principles of tue religion by cnthufiafm and fuperfition, reafon and candour will not for a moment hefitate to acknuwledge, that the whole fyltem of revelation reprefents the Supreme Being in the moft fublime and amiable light: that, in it, religion appears effentially connefted with morality: that the legifitive code of Mofes was fuch as no legiflator ever formed and eftablifhed among a people equally rude and uncultivated: that the manners and morals of the Jews, vicious and favage as they may in fome inflances appear, yet merit a much higher character than thofe cither of their neighbours, or of almoft any other nation, whofe circumftances and charagter were in other refpects fimilar to theirs : that there is au infinite difference between the Scripture prophecies and the oracles and predictions which prevailed among heathen nations: and that the miracles recorded in thofe uritings which we efteem facred were attended with circumfances which entitle them to be ranked in a very

## R EL

Religinn. different clafs from thofe which enthuliafm and impofture have fabricated among other nations. Sce Miracle and Prophecy.

But as the evidence of the divine origin of the primxval reiligion refts particularly on the anthority of the firft five books of the Old Teliament, it may be thought incumbent on us to fupport our reafoning on this fubject, by proving, that the author of thore books was indeed infpired by God. This we flall endeavour to do by one decifive argument; for the mature of the article, and the limits prefcribed us, admit nut of our entering into a minute detail of all that has been written on the divine legation of Mofes.

If the miracles recorded in the book of Exodus, and the other writings of the Hebrew lawgiver, were really performed; it the firt-born of the Egyptians were all cut off in one night, as is there relited; and if the children of Ifrael pafled through the Red fea, the waters being divided, and forming a wall on their right hand and on their left-it mult necelfarily be granted, that Mofes was fent by God; becaufe nothing lefs than a divine power was fufficient to perform fuch wonderful works. But he who fuppofes that thofe works were never performed, mutt affirm that the books recording them were forged, either at the era in which the miracles are faid to have been wrought, or at fome fubfequent era: There is no other alternative.

That they could not be forged at the era in which they affirm the miracles to have been wrought, a very few reflections will make incontrovertibly evident. Theie books inform'the people for whofe ufe they were writen that their author, after having inflicted various plagues upon Pharaoh and his fubjects, brought them, to the number of 600,000 , out of Eyypt with a high hand; that they were led by a pillar of cloud through the day, and by a pillar of fire through the night, to the brink of the Red fea, where they were almoft overtaken by the Egyptians, who had purfued them with charicts and horfes; that, to make a way for their efcape, Mofes Itretched out his rod over the fea, which was immediately divided, and permitted them to pafs through on dry ground, between two walls of water ; and that the E. gyptians, purfuing and going in after them to the midit of the fea, were all drowned by the return of the waters to their ulual fate, as foon as the Hebrews arrived at the further flore. Is it poflible now that Mofes or any other man could have perfuaded 600,000 perfons, however barbarous and illiterate we fuppofe them, that they had been witneffes of all theie wonderful works, if no fuch works had been performed? Could any att or elo. quence perfuade all the inhabitants of Philadelphia, that they had yefterday walked on dry ground through a fea twenty or thirty miles wide, the waters being divided and forming a wall on their right hand and on their left? If this queftion mult be antivered in the negrive, it is abfolutely impofible that the books of Mofes, fitppofing them to have been furged, could have been received by the people who were alive when thofe wonders are faid to have been wrought. In any after Let us now inquire, whether, if they be forgeries,
pcriod. they could have been received as authentic at any fubfequent period; and we fhall foon find this fuppotition as impofible as the former. The books claiming Moles - Deut. for their author fpeak of themfelves as delivered by lim xxi. 24 - and from his days kept in the ark of the covenant ${ }^{*}$; an $2 \%$.
ark which, upon this fuppofition, had no cxifence prics to the forgery. They tpeak of themfelves likewife, not only as a hiftory of miracles wrought by their author, but as the flatutes or municipal law of the nation, of which a copy was to be always in the poffeflion of the priefts, and another in that of the fupreme magiftratet. Now, in whatever age we fuppofe thefe books io have been forged, they could not pollibly be received as authentic; becaufe no copy of them could then be found either with the king, with the priefts, or in the ark, though, as they contain the fatute law of the land, it is not conceivable that, if they had exifed, they could hive been kept feeret. Could any man, at this day, forge a book of flatutes for England or America and make it pafs upon thele nations for the nnly book of Itatutes which they had ever known! Wras there ever fince the world began abook of tham fatutes, and thefe, too, multifarious and burdenfome, impofed upon any people as the only fatutes by which they and their fatthers had been governed for ages? Such a forgery is evidently impolible.

But the books of Mofes have internal proofs of authenticity, which no other books of a ncient It.entes ever had They not only contain the laws, but $f$ al give an hiftorical account of their enastment, atid the reafons upon which they were founded. Thus they tell usj, that the rite of circumeifion was inflituted as a mark of the corenant between God and the founder of the Jewrifn nation, and that the practice of it was cuforesd by the declaration of the Almighty, that every uncircumcifed man-child thould be cut off from lis people. They informusthat the annual folemnity of the pafover was inflituted in commemoration of their deliverance when God flew, in one night, all the firt-bern of the Estptians; that the firft-born of Ifrael, boih of men and bean, were on the fame occafion dedic:ted for ever to God, who took the Levites inflead of the firftborn of the men $\ddagger$; that this tribe was confecrated as priefts, by $\mid$ Exod. xii. whofe hands alone the facrifices of the penple were to and Numb. be offered; that it was death for any perfon of a differ-viii. ent tribe to approach the altar, or even to touch the ark of the covenant; and that Aaron's budding rod was kept in the ark in memory of the wonderful defruation of Korah, Dathan, and Abiram, for their rebellion again?t the priefthood.

Is it poffible now, if all thefe things had not been pracifed among the Hebrews from the era of Miotes, with a retrofpect to the fignal mercies which they are faid to commemorate, that any man or body of men could have perfuaded a whole nation, be means of forged books, that they had always religinully oblen ved fuch infliturions? Conld it have been ponlible, at any period pofterior to the Exodns, to perfuade the Ifraeiites that they and their fathers had all been circumcifed on the eighth day from their birth, if they had been confcious themfelves that they hat neverbeen ci cumeifed at all ? or that the pafover was kept in memory of their deliverance from Egyptian bondage, if no fuch feftival was known among them?
But let us fuppofe that circumcifion had been practifed, and all their other rites and ceremonies obferved from time inmemorial, without their knowing any reafon of fuch inftitutions; fill it mult be confeffed that the forger of thefe books, if they were forged, cona fructed his parrative in fuch a manner as that no man

 owneng to m the then eilectal faceed was oppeffively
 Hered in :" hit wetaty to t.e telt by moving the a:k
 ane bave cerned the impolure. Tlie budding rad, It ond the pot of mana, which, though long preferled, were never betore heard of, munt have produced i-quiries that conid net tail ta end in detection. Thefe thooks jpent lihewile of weckly fabbaths, daily facrifices, a yealy erpiation, and monthly fefivals, all to be kept antrenerabrance of great thines patieularly tpecified as done for the nation at an carly feriod of its exillence. If this was not the cafe, could the forger of the books bave perfurded the poope that it really was fo? The calightened reaticners of this nation would be offended were we to compare them with the ancient Ifraelites; but furely they will not fay that we are partial to that leophis, if we bring them to a level with the morl favage tribes of the Ruflian empire, who profeis Chriftianity? Now, weste a book to be forged containing an account of many Rrangre things done a thoufand years ago in iiberia by an sipcllonius, or any other philofopher (ir kere, rumbers of the barbalians inhabiting that country would, we doubt not, give implicit credit In the $l_{0}$ chnd: But were the author, in confirmation of 1 is narrative, to affirn, that all the Sibcrians had from that day to th:s kept facred the firft day of the week in memory of his keru; that they had all been baptized or circumcifed in his name; that in their public judicatories they hadiforn by his name, and upon that very book which they had never feen before: and that the wery fame book was their law and their gofpel, by which for a thouland years back the actions ot the whole people had been regulated-furely the groffeft favage anong them would reject with contempt and indignanon a forgery fo palpable.

If this reafoning be conclufive, the books of Mofes muit indubitably be authentic, and he himfelf muft have reen infpired by the fpirit of God. But this point heing eltablithed, the queftion refpecting the origin of the primeval religion is completely anfwered. The writer of the book of Gencfis informs us, that Adam and Nuah received many revelations from the Auther of their being, and that their rcligion was founded on the jrincipics of the pureft theifm. How it degenerated anaing the greater part of their defcendants into the sroffel idolatry, has becn fhown at large in another place. Sce Polytirism.
II. Ikaving thus anfwered the firt queltion propofed for difculion in the prefent article, we now proceed to confider the fecond, and to inquire whether and how far religions femtiments have a tendency to ir jure or to promote the welfare of fociety? This is a fubject of the lumoft importance; and if we prove fincectiful in our inçuiries, we thall be enabled to determine whether the quvernors of mankind ought carefnily to fupport reliEisus efrablifiments, or whether the philofopher who eills himelf a citizen of the world, and profeffes to fecl the noof eager defire to promote the interefts of his fpecies, acts confiftently when he labours to exterminate religion from amory mon.

A celebrated French finarcier *, a man of abilities
and rines, who has publifhed a book on the importanic of religit us opinims, labours to thow that religious eltablithonentsare indijpenfably ucce!lary for the maintenance of civil order, and demonftrates how weal: the influence of polnical inftututions is on the moral of mankind; but he refures to review the hiftory of palt ages in order to difoner how far religious opinions have actually; been injurinus or bencficial to the welfare of fociety ; choofing rather to content himfelf with the refult of a feries of metaphytical difqu:titions.

We adraire the ipiit which induced a man who had fpent a confiderable jart of his life amid the hurry of public bufirefs, to become the frenucus advocate of religion ; but we canno: help thinking that, notwithfanding the cloquence, the acntene?s, and the knowledge of mankind which he has difplayed, his refuling to admit the evidence of facts concerning the influence of religion on fociety may poffibly be regarded by its enemies as a tacit acknowledgement that the evidence of facts would be unfarourable to the caufe which he withes to defend. The fallacy of general reafonings, and the inutility of metaphyfics for the purpofes of life, are fo tuiverfally acknowledged, that they have long been the theme of declamation. Though the abufes of religion, as well as the abures of reafon, the perverfinn of any of the principles of the human mind, and the mifapplication of the gifts of providence, may have often produced effees hurtful to the virtue and the happinefs of mankind ; yet, after tracing religion to a divine origin, we camnot, for a moment, allow ourfelves to think that the primary tendency of religion mult be horite to the incerefts of focisty, or that it is necelfary to view it abftractly in order that we may not belold it in an odious light. Often has the fceptic attacked religion with arttul malice; but perhaps none of his attacks has been fo fkilfully ditected as that which has firft ridiculed the abfurdity of the mof abfurd fupertitions, and afterwards laloured to prove that the moft abfurd fyftem of polytheifm is more favourable to the interelts of fociety than the pureft and moft fublime theifm. Inftances in which the abufe of religion had tended to deprave the human heart, and had led to the moft fhocking crimes, have been affiduoufly collected, and difplayed in all the aggravating colours in which eloquence could array them, till at length even the friends of true religion have been abafhed; and it has become a fafthionable opinion, that nothing but felf-interelt or bigotry can prompt men to reprefent religion as the friend of civil order. But let us try ir, by a candid confideration of what effects have refulted to fociety from religious principles, in general, without comparing thefe with regard to truth or falfehood, we can advance any thing to vindicate the character of rcligion.

Notions of Deity in gencral, of various orders of divinities, of their moral character, of their influence on human life, of a future ftate, and of the immortality of the human foul, conflitute the leading articles of religion. Let us view thefe torether with the rites to which they have given rife; and we may perhaps be enabled to form fome well-grounded notions on this important point.

1. Having proved that the firf religious principles entertai:ned by men were derived from revelation, it is impofible to fuppefe that they could produce cffects in-

Peligion. $\underbrace{\sim}$ jurious to focieir. If religion of ary lind has ever lefiened the virtue or dituibel the pesce ot men, it mult have been that religion which fprings fiom a belief in a multitude of iuperior powers actuated by palfions, and of whem fome were conceived as benevolent anil others as malicious beings. That fuch tentiments fhouid have produced vices uaknown in tocizties, where

25
The effea or itheim of the matuners of nations.
ar more maligament than that of the rion abfurd paganifm.
parecheifm is protelied, will be ie.dily admit.ed. Even the few atheifs who live in Chriition or Mahometan countrics are reftrained by the laws, by a detire to promote the honour of the let, and by many o:her confiteratoms, from indulging in practices which $t$ e exampic of the falie godo of antiquity fanctioned in their votaries. lisut in determi:ing the prefent queltion, we noul net compare the virtucs of the paran wom with thofe of individual athe Rs in modern Europe, bot with theic of sations proefling atheifm; and liuch nations are nowhere to be found. We can however ealily ennceive, that in a fociety unawed by any notions of God or a future fate, no fuch laws would be enated as thofe which reftrain the fenfual appetites; of which the criminal indulgence was one of the greateii figmas on the pagan worthip of antiquity. In fuch tucictics, thee coore, thole vices would be pratifed confantly to which paganilm gave only an occafional fanction ; and many others, in fite of the utmoft vigilance of human liws, would be perpetiated in fecret, which the molt protligate pagans viewed with horrer. Confcience, though ating with all her energy, would not be able to command any regard to the laws of morality: No virtue would be known; iocial order would be nowhere obferved ; the midnight affafin would everywhere be found ; and in the general feramble mankind would be exterminated from the face of the earth.

The worlt fpecies of paganiim, even that whith prevails among favages who workhip evil fpirits, affords greater fecurity than this. It is indeed fhocking to think that demons fhould be worfhipped, while deities, who are regarded as being all benevolence, are treated with contempt: And it has been aiked, If the influence of fuch religious fentiments on the moral practice of the idolaters muft not naturally be, to caufe them to treat their friends and benefactors with ingratitude, and to humble themfelves with mean fubmilion bcfore a porserful enemy ?

They do not appear to have produced fuch effects on the morality of the favages by whom they were enrertained. The benevolent deities were neglceted, only becaufe their benevolence was neceffary. A voluntary favour merits a grateful return : a defigned injury provokes refentment. But when you hecome, by accident, the infrument of any man's good fortune, the world wiili fearce confider him as owing you any obligation: the fone which bruifes your foot excites only a momentary emotion of rcfentment. Thofe gods who could not aroid doing good to men might not receive a profution of thantis for their fervices; and yet a favour conferred by an human benefactor commands the warmell gratitude. But thofe rude tribes appear to have had fo much wifdom as to confer a lefs abfolute malice on their malevolent deities, than the benevolence which they attributed to their more amiable order of fuperior beings: though the latter could not poffibly do them any thing but good, and that conflantly; yet the foriner were not under an equally indifpenfable ncceffity of Voc. XVI.
perfevering in deprofing them under calamitics. Cn R.:ixion. their malevalent deities they conferred a fredom of argency which they deniad to the benevolent. No wonder, then, that they were more affiduous ia paying their court to the one than $t$, the othe!. They mriglit with as muila propriety inave thought of being gratetiol in the boar ir llag whole feth furproted them, as to deities who were aluays beneroknt, bectufe they comht not pofioly be ctherwie. Though nigligent of fuch deitics thits can farce be thought to have k.ad any: :e:dency to render them ungrateful to bendiafors like themieives. ind yet, it mut rot be difiemoled, that the American Indians, ameng whom fuch religious feniments have been found to prevail, are faid to be very li.t.e fenfille to the emotions of gratitude. An Indian receives a prefent without thinking of making any grateful acknuwledgments to the beltower. He pleates his fincy or gratufies his apperite with what you have given, without feeming to confider hinnelf as under the fmallett obligation to you for the gift.

It may be doubted, however, whether this fpirit of ingratitude originates from, or is only coltateral with, that indifference which refufes adoration and worthip to the benevolent divinities. If the former be actually the cate, we nutt acknowledge that thofe religious notions which we now conficer, though preferable to general atheifm, are in this refpest unfriendly to virtue. But if the Indians may be thought to owe the ingratituds for which they are diftinguithed to the opinion which they entertain of the exiftence of a benevolent order of deities, whofe benevolence is neceffary and involuntary, their ideas of the nature of their malevolent demons d, not appear to have produced equal effects on their moral fentiments. However fubmiffive to thofe dreaded beings, they are far from fhowing the fame tame ard cowardly fubmiffion to their human enemies: towards them they feem rather to adopt the fentiments of their demins. Inveterate rancour and brutal fury, inhuman cruelty and inconceivable cunning, are difplayed in the hofilities of tribes at war ; and we know not, after all, if even thefe ientiments do not owe fomewhat of their force to the influence of religion.

Yet let us remember that thefe fame Indians have not been always reprefented in fo unamiable a light; or, at leaf, other qualities have been afcribed to them which feem to be inconfifent with thofe barbarous difpofitions. They have been deferibed as peculiarly fufceptible of conjugal and parcntal love; and he who is fo cannot be deltitute of virtue.
2. But leaving the religion of favages, of which very The influlittle is known with certainty, let us proceed to exa- cace of mine what is the natural influence of that mixed fytem Greck and of theology which reprefents to the imagination of men Roman paa number of fuperior and inferior divinities, actuated lytheifin. by the fame palfions and feelings with themfelves, and often making ufe of their fuperior power and knowledge for no other purpoie but to enable them to violate the laws of moral order with impunity. This is the celebrated polytheifm of the Greeks and Romans, and moft other nations of antiquity (fee Polytheism). Could its influence be favourable to virtuc?

At a firf view every perfon will readily declare, that apparentfuch a fyftem mult have been friendly to profligacy. If ly friendly you commit the government of the univerff, and the to profigzo infjection of human focicty, to a fet of beings who are cy;

1
oftea

K i $0 \%$.olinn ciapucd to regard vice with a no leis firoumable eyce than virtue, and whe, thonglo laete be an eltabithcan ader by which vitue is diferiminated from vice, and riglet trom wrong, yet [chuple net to vic] ate that order in their own condue? you cannat exped them so require in you a degree of icetitude of which they themelves aprear incapable. A Mercury will yot difcomage the thievilh arts of the thader; a Bachu; ard a Venus canot frown upon debauclucry; Mus will behah with fivage delight all the cruckes of war. The 'Ihracians indeed, ne of the moll basbareus arations of antiquity, whofe ferocity was little if at all inferior to that of the Indians whu had been diflingruithed as c:a nibals, was the farourite nation of Mars; ancong whom flowd his palace, to which he repaired when about to mount his chariot, and arm limielf for batte. Even lupier, who had been guilty of fo many ans (ityrannical caprice, had been engaged in fuch a multitude of amorous int:igues, and feemed to owe his elevated thation as monath of the lly, not to luperior goodnefs or widem, but merel; to a fuperior degiee of brutal torec, could not be feared as the avenger of ctimes, or revered as the impartial rewarder of virtues.

That this fyltem had a pennicious effeet en morals,

Eut uben cuatrafted with $2=$ theifm its effects were and that, as compared with pure theifm, it was hjurious to focicty, cannot be denied; but yet, when contrated with atraifm, it was not without its favourable effects. It was fo conne?ted with the order of fociety, that, without its fupport, that order could farce have been maintained. The joung rake mightit perhaps ju* fity himfelf by the example of Jupiter, or Apollo, or fome other amorous divinity; the frail virgin or matron might complain of Cupid, or boaf ot imitating Venus; and the thief might practife his craft under the patronage of Mcrcury: But if we take the whole flltem rogether, if we confider with what views thofe deitics were publicly worthipped, what temples were raifed, what rites inkituted, what facrifices offered, and what feris confecrated: we hall perhaps find it neceffary to acknowledge that the general effects even of that mixed and incoherent fytem of polytheifm which prevailed among the Greeks and Romans were favourable to fociety. To Atate a particular intance; the ancilia of Mars ard the fire of Vefta were thought to fecure the perpetuity of the Roman empire. As lorg as the facred ani's, which had been dropped fiom heaven for dhat benevolent purpofe, was fafely preferved in thofe holy archives in which it had been depofited; and as long as the facred lire of Vefta was kept burning, without being once cxtinguillied, or at leal fuffered to remain for an infant in that fate ; fo long was Rome to fublift and flourifh. Aud, however fimple and ab. furd the ided which conneted the profperity of a nation with the prefervation of a piece of wond in a cerain place, or with the conflant blazing of a flame upon an hearth; yet no fad call be more certain, than that the patiotifm and en:huffaftic valour of the Romans, which we fo muchext. 1 and admirc, were, in many inflances, cwing in no inconliderable degree to the veneration which they entertained for the ancilia and the

Was tha indlucnce of the facrawintum adminiftered to the foldiers when they enlilled in the fervice of their cotnty? ' The promifes made, the idea of the powers invoked, and the rites pertiomed on that occalion, producculo deep and fo auful atm imprellion on (licir minds, that do danger, nor dilleffs, nor difcontent cculd prompt them to violate their engagements. The refponfes of the oracles, too, thought the dictates of deceit and inpoflure, were often of fingular fervice to thote to whon they were uttered; when they infires the warrior, as he marched ont to battle, with the cosfidence of fucces, they communicated to him new vigour, and more heroic valour, by which he was act:ally cnabled to gain of at leaft to deferve, the fuccef3 which they promiled. Again, when in times of pulilie diftrets, the augur and the pricit directed fone ganus to be celebrated, cettain factifices to be oflered, or fome other folemnities to be performed, in order to appeate the wrath of the offended deities; it is plain that the means wete not at all fuited to accomplill the end p:opoled by them; yet fill they were laighty beachelial. When the at:ention of the whole penple was turned entirely to thofe folemnities by which the wrath of hearen was to be averted, they were roufed from that defpondency under which the fenfe of the public difterts or danger might have otherwife caufed them to fink: the public maion was at the fame time more clofely cemented, and the hearts of the people bnit together; and when perfuaded, that by propitating the gods they had removed the caufe of their diftefs, they acquired fuch calmnefs and Itrength of mind as enabled them to take more direct and proper meafures for the falcty of the ftate.

Could we view the ancient Grecks and Romans ate ing in public or in private life under the influence of that fyttem of fuperftition which prevailed among them; could we perceive how much it conmbuted to the maintenance of civil order ; conld we behold Numa and Lycurgus eltablinhing their laws, which would other wife have met wihh a very different reception uader the fanclion of divisities; could we obferve all the be. neficial effects which arofe to communities from the celebration of religions ceremonies-we fhould no longer hefitate to acknowledge, that thete pinciples in the human heart by which we are lufceplible of seligious fentiments, are io eminently calculated to promote the happinefs of mankind, that even when perverted and abufed, their influence is Rill favourable.

The ideas which prevailed among the nations of the Their ${ }^{25}$ heathen world concerning a future flate of retribution tion of a were, it mult be confeffed, not very correct. Some of furure flato the poets, we believe, have reprefented them in no un- of retribue fair light: both Homer and Virgil have condufed their tion incorheroes through the realms of Pluto, and have taken occafion to unlold to us the fectets of thofe dreary abodes. 'The fceses are wild and fanciful ; the rewards of the juil and virtuous are of no very refined or dignified nature : and of the punifhments infieted on the guily, it is often hard to fay for what ends they could be infiaced ; whether to correst and improve, or for the gratification of revenge or whim: they are often fo whimfical and unfuitable, that they cannot with any degree of propricty be afcribed to any caufe but blind chance or wanton caprice. A great dog with threc tongues, a peevifh old boatman with a leaky ferry-boat, demanding

 worthy of punifhment. It was not always virtue or ready excufe for the moft extravagant crimes.manding his frcight in a furly tone, and and uxarious monarch, are objects too familiar and ludicrous not to degrade the dignity of thofe awful feenes which are reprefented as the manlions of the dead, and to prevent them from making a deep cnough impreffion on the inngination. The actions and qualities, tor, for which departed firits were admitted into Elyfium, or d omcd to the regions of fuffering, were not always of fuch a nature as under a well-regulated governmer, on earth wou'd have been thought to merit reward, or to be wifdom which conduated to the Elyfian fields, or gained admillion into the fociety of the immortal gods. Ganimede was for a very differeat redon promoted to be the cup-bearer of Jove; and Hercules and $\mathrm{Bicch}_{\text {a }}$ could not furely plead that any merits of that kind entitled them to feats in the council, and at the banquets of the immartals. That doarine, litewite, which reprefented mortals as hurricd by fate to the commiffion of crimes, which they could no more abfain from committing than the fword can avoid to obey the impulte of a powerful and furious arm planging it into the breaft of an unrefiting antagoiilt, could not but produce effects unfavourable to virtne; and it afforded a

Yer, after all, he who attentively confiders the ideas of the Greeks and Romans concerning the moral government of the world and a future thate of rewards and punithments, will probably acknowledge, that their general influence muft have beenfavonrable to virtue and motal order. Allow them to have been incorrect and dathed with abfurdity; fill they reprefent punilhments prepared for fuch qualities and actions as were injurious to the welfare of fociety ; whilf, for thofe qualities which rendered men eminently ufeful in the world, they hold forth a reward. Though incorrect, their ideas concerning a future ftate were exceedingly diftinet ; they were not vague or general, but fuch as might be readily conceived by the imagination, in all their circumftances, as really exitting. When a man is told that for fuch a deed he will be put to death, lie may thudder and be alarmed, and think of the deed as what he mun by no means commit; but place before him the feene and the apparatus for his execution, call him to behold fome other criminal mounting the fcaffold, addreffing his laft words in a wild fcream of defpair to the furrounding fpectators, and then launching into eternity-his horror of the crime, and his dread of the punifhment, will now be much more powerfully excited. In the fame manner, to encourage the foldier marching cut to battle, or the mariner fetting fait under the profpect of a form, promife not, merely in general terms, a liberal reward; be fure to fpecify the nature of the reward which ynu mean to beftow; defcribe it.fo as that it may take hold on the imagination, and may rife in oppofition to the images of death and danger with which his courace is to be alfailed.

If thefe phenomera of the human mind are fairly fated, if it be true that general ideas produce no very powerful effeas on the fentiments and difpofitions of the human heart, it muft then be granted, that though the feenes of fucure reward and punifhment, which the heathens confideled as prepared for the righteous and the wicked, were of a fomewhat motley complexion; yet ftill, as they were diftinct and even minute draughts,
they mult have been favourable to virtue, and centribu- Relision. ted in no inconfiderable degree to the fupporit of civil order.

Another thing of which we may take notice undir The nomem this head, is the valt multiplicity of deities with which of dertict the Greck and Roman mythology perpled all the re- all nature gions of nature, Tlocks and fields, and whods and of a uflet $0 . k$ s, and fowers, and many much more minute olje ©: had all cheir guardian deities. Thefe were fomerinat wheach $1-$ capricinus at times, it is true, and expected to liave at- pared w.t. 2 tention paid them. But yet the faithful fhepherd, and atheife?. the induftious farmer, knew generally how to acquire their friendhip; and in the idea of deities enjoying the fame fimple plafures, partaking in the fame labours, protesing their poffeftions, and bringing forward tha fruits of the year, there could not bu: be fomething ti a very pleafing nature, highly favourable to inhuitr:" which would animate the labours, and cheer the fellivals, of the good people who entertained fuch a notion; nay, would diffufe a new charn over all the feenes of the country, cven in the gayelt months of the year.

From all of thefe particular obfervations, we think ourfelves warranted to conclude, that notwiiliftanding the mixed characters of the deities who were adored by the celebrated nations of antiquity ; though they are in many inflances reprefented as confpicuous for vices and frolics; however vain, ablurd, and morally criminal, fome of the rites by which they were worlhipped may have been, and however incorrect the notions of the heathens concerning the moral government of the univerfe and a future flate of retribution; yet Alll, after making a juft allowance for all thefe imperfections, the general influence of their religious fyttem was rather favourable than unfavourable to virtue and to the order and happinefs of fociety.

It was not without good reafon that the carlieft legif. The advanlators generally endeavoured to eftablifh their haws and tage of confitutions on the balis of religion; government needs eftablinling
 the fupport of opinion; the governed muft be impreffed with a belief that the particular eftablithmeat and lated for their fecurity and happinefs, or is fupported on fome fuch folid foundation, that it muft prove im. poffible for them to overturn it, or is connected with fome awful fanction, which it would be the moft heinous impiety to oppofe. Of thefe feveral notions, the latt will ever operate on moft men with the moft fteady influence. We are frequently blind to our own interett ; even when cager tor the attainment of happinefs, we oftern refufe to take the wifet mealures for that end. The great bulk of the people in every community are fo little capable of reafoning and forefight, that the public minither who thall molt fteadily direct his views to the public good will often be the moft unpopular. Thale laws, and that fyltem of governmen:, which are the moft beneficial, will often cxcite the frongef popular difcontents. Again, it is not always eafy to perfuade people that your power is fuperior to theirs, when it is not really fo. No onc man will ever be able to perfuade a thosfand that he is Atronger than they all together: and therefore, in order to perfuade one part of his fubjects or army that it is abfolutely necelfary for them to fubmit to him, becaufe any attempts to refint his power would prove ineffequal, a monarch or general mult take care firf to perfuade another part that it is for their in-

 b.lich tha", wea's and pitifil is le himfif nony appeat, whea viewed lingly in oppolition to them a! !, yet by the athionn e of come awful invifible Leings, his liends and proicitor, 1 is is puwarlul, that any atiompts to redit his wah rity matt prove prefimpenous toly. I Iere, then, the aid of religion becomes reqnitite. Religious fontinnats are the mof happily calculated to ferve th is 1 arpere. Scarce ever was there a fucisty forme '. a in. d e (: govermment eftablifned, or a code of laws fommed and enteted, whotht having the religions fortiwents of mankind, their notions of the exintrice of luferi.r insifible heings, and their lopes and fears from tholo beinge, as is tundamental puinciple. Now, we Welieve, it is almont univerlaby agreel, that ever the sudet form of socinty is more favourable to the happi. neis dfmankind, and the dignity of the hum an character, tion a fultary and favage ftate. And if this, with what we have atiolted conconing religion as the batis I' civil government, be borls granted, it will follow, that even the molt imperfect religious notions, the moft foolish and abfurd rites, and the widdef idea: that have been entertained concerning the moral government of the univerfe by fuperior beings, and a fiuture tata of :cruibution, have been more adsantageous than atheifm to the happincfs and virtue of humin life. We have alcondy granted, nor can it be denied, indeed, that many of the religicus opinions which prevailed among the ancient heathens, did contribute, in fome degree, to the doprawation of their morals: and all that we argue for is, that on a comparative view of the evil and the good which refulted from them, the latter mult appear more than adequate to cuunterbalance the effects of the former.
The inficite alwantage of a pure, ra- $^{-}$ tonal, and true rel:๕̇O:

But if fuch be the natural tendency of thofe principles by which the human heart is made fuiceptible of relig:ous fentiments, that cren enthularm and abfurd fuperftition are productive of beneficial effeefts more than fufficient to cou.terbalance whatever is malignant in their ir.lluence on fociety-furely a pure rational reli- gion, the docuines of which are founded in nudeniable truth, and all the oblervances which it enjoins, calcula. ted to premete by their direet and immediate effects i me ufeful purpofes, muft be ia a very high dearee cincucive to the dignity and the happines of human nt:ure. Indeed one collateral proot of the truth of any religion, which mult have very confiderable weight with :ll who are not of opinion that the fyftem of the univerfe has been produced and hitherin mairtuined in crder and exifence by blind chance, will be its having a fronger and more ditef tendency than orhers to promote the interelts of moral virtue and the happinelis of mankind in the pelent life. Even the teftimeny of thoufands, even miracles, prophesies, and the fanaien of remote antiquity, will fcarce lave fufficiont weight to perfade us, that a religion is of divine origin, if its geaeral tendency appar to be rather unfavourable than ad"antueous to motal vitue.
III. We fhall therefore, i: the nest place, enjeawor to determise, firm a comparative view of the effoEt; produced on the charafer and circumanances of forcicty by the maft cmiant of thefe various fyitems of religion whech bave been i.s different ages or in diferore countries eflablificd in the world, how far any one of them las in this refpet the advantage over the reft; and, if the utility of a fythem of religion were to
be rcceised as a teft of its truth, what particular fy fem Rehigion. m ght, with the belt reafon, be received as true, while the relt were rejected.

1:l, The principle upon which we here fet out is, that all, or almotit all, 1yttems of religion with which we are acquanted, whether true or fahe, contribute more or lels to the welfirs of fuciety. But as one held is more fruitul, and one garden lets overgrown with we:ds than another; $[0$, in the fame manner, one fyltem of reliwious opinions and ceremonies may be more happily calculued than others to promote the tructe interelts of mantind. In oppofition to thofe philnfophers who are fo vehement in their dechamations again the inequalicy of ranks, we have cver been of opinion, that reazoment and civilization contribute to the happincis of homan iife. The chatailer of the folitary favage is, we are told, more dignified and refpectable than that of the pimbopher and the hero, in proportion as he is mare independent. He is indeed more independen: ; but his independence is that of a fone, which reccives no nourifment from the e.irth or air, and communicates none to animals or verctables around it. In point of happinets, and in point of relpectability, we cannot helitate a monent, let philo!ophers lay what they will, to prefer a virtuous, colightenes, and polithed citizen to any of the rudan favages, the lealt acquainted with the reftraints and the fympathies of focial life, that wander through the wild forelts of the weitern world. But if we pre-And therefer civilization to barbarifm, we mula admir, that in this view Chriftianity has the advantage over cvery other religious fyften which has in any age or country prevailed among men; for now here has civilization and ufefni fcience been carried to fuch a teight as amung Chrittians.

It is not. indeed, in any confiderable degree that the viow of ${ }^{33}$ abfurd fuperfitions of thofe rude tribes, who can farce the various be faid to be formed inio any regular fociety, can con- ret.ginus tribute to their happinefs. Among them the faculty notons of of :eafon is but in a very low flate; and the moral prin. Bagan maciple ntially follows the improveme tor the deprellion of the reafoning faculty. Their appetises ard merely animal paftions are almof their only pinciples of actior: their firf religious notions, if we fuppofe them not to be derived from revelation or tradition, are produced by the operation of gratitude, or grief, or hope, or fear, upon their imaginaticns. And to thefe, however wild and fanciful, it is not improbale that they may owe forme of their ealieft meral ntions. 'The idea of fuperior powers naturally leads to the thouglat that thofe powers have fome intuence on human litc. From this they will moft prubably proceed to fancy one fet of attons agreeable, another offertive, to thote beings to whom they believe themeives fubject. Aud this, perhaps, is the firf difindion that fevages can be fupFocd to form between actions, as right or wrorg, to be performed or to be avoiled. But if this be the cafe, we mult acknowledge that the religious notions of the fav.l?c, however ablird, contribute to clevate his character, and to impreve his happinefs, when they call forth the moral principle implanted in his brea?.

But if the focial Ante be preferable to a fate of wild and flitary indepondence, even the rale fuperatitions of unenlightened tribes of favages are in another refpeft bencficial to thofe among whom they prevail. They ufuaily

Religion. ufually form, as has been already obferved under this article, the bafis of civil order. Religious opinions may lead the great body of the commaniy to reverence fome particular fet of inftitutions, fome individual, or fome family, which are reprefented to them as peculiarly connected with the gods whom they adore. Under this fanction fome form of government is eftablilhed ; they ate tanght to perform focial duties, and rendered capable of focial enjoyments. Not only Numa and Lycurgus, but almoft every legiflator who has fought to civilize a rude people, and reduce them under the reftraints of legal government, have eal cavoured to imprefs their people with an idea that they acted with the approbation, and under the immediate direction, of fuperior powers. We cannot but allow that the rude fuperftitions of carly ages are productive of thefe advantages to fociety; but we have :already acknowledged, and it cannot be denied, that they are alfo attended with many unhappy eficets. When we view the abfurdities intermixed with the fyfems of religion which prevailed among moft of the natinns of antiquity, we cannut help lamenting that fo noble a principle of human nature as our religious fentinzents Thould be liable to fuch grofs perverfion; and when we view the effects which they produce on the morals of mankind, and the forms of fociety, though we allow them to have been upon the whole rather benericial than hurtful, yet we cannot but obferve, that their unfavourable effects are by far more numerons than if they had been better directed. What unhappy effects, for inttance, have been produced by falfe notions concerning the condition of human fouls in a future ftate. Various nations have imagined that the fcenes and objects of the world of fpirits are only a fhadowy reprefentation of the things of the prefent world. Not only the fouls of men, according to them, inhabit thofe regions; all the inferior animals and vegetables, and everinanimate bodics that are killed or deltroyed here, are fuppofed to pafs into that vilionary world; and, exiting there in unfublantial forms, to execute the fame functions, or ferve the fame putpofes, as on earth. Such are the ideas of futurity that werc entertained by the inhabitants of Guinea. And by thefe ideas they were inducod, when a king or great man died among them, to provide for his comfortable accommodation in the world of firits, by burying with hinı meat and drink for his fubfiftence, flapes to attend and ferve him, and wives vith whom he might Atll enjoy the pleafures of love. His faithful fubjects vied with each other in offering, one a fervant, another a wife, a third a fon or daughter, to be fent to the other world in company with the monarch, that they might there be employed in his fervice. In New Spain, in the ifland of Java, in the kingdom of Benin, and among the inhabitants of Indoftan, fimilar practices on the fame oceation, owing no doubt to fimilar notions of futurity, have been prevalent. But fuch prastices as thefe cannot be viewed with grcater contempt on account of the opinions which have given rife to them, than horror on account of their unhappy effects on the condition of thofe among whom they prevail. A lively impredion of the enjoyments to be obtained in a future itate, together with fome very falfe or incorred notions concerning the qualities or actions which were to cntitle the departing foul to admifioa into the feene of thofe cnios.
ments, is faid to have produced equally unlappy ef. Re'igion. fects among the Japanefe. They not only bribed their priefts to folicit for them ; but looking upon the enjoyments of the prefent life with difgult cr contempt, they ufed to dath themfelves from precipices, or cut their throats, in order to get to paradife as foon as pofible. Various other fuperllitions fubfiling among rude rations might here be enumerated, as in!lances of the perverfion of the religions pinciples of the human heart, which render them injuriuus to virtue and lappFinels. The auterities which have been practiled, chicfly among rude nations, as means of propitiating fuperior powers, are efpecially worthy of notice.When the favomrite idol of the Banians is carried in folemn procellion, fome devotees proftrate thenfolves on the ground, that the chariot in which the idol is carried may ran over then; others, with equal enthufiafm, dath themfelves on fpikes faftened on purpofe to the car. Innumerable are the ways of torture which have been invented and practifed on themfelves by men ignorantly friving to recommend themfelves to the favour of heaven. 'Thefe we lament as inftances in which religious fentiments have been fo ill directed by the influence of imagination, and unenlightened errirg reafon, as in produce unfavomable eflects on the human character, and oppofe the happinefs of focial life.Though we have argned, that even the noof abfurd fyftems of religion that have prevailed in the wor!d, have beer, upon the whole rather beneficial than irjurious to the dignity and happinefs of human nature; yct if it Thall not appear, as we proceed farther in cur comparative view of the effects of religion on fociety, that others have been attended with happier effects than thefe filperftitions which belong to the rude arुes of focicty; we may farce venture to brand the infidel with the appellation of fool, for refufing to give his affent to religious dectrines, or to act under their influence.

2 d . The polytheifm of the Greeks and Romans, and other heathen nations in a fimilar ftate of civilization, we have already confidered as being, upon the whole, rather favourable than unfavourable to virtue: but we mult not partially conceal its defects. The vicious characters of the deities which they worhipped, the incorrect notions which they entertained concerning the moral government of the univerfe and a future retribution, the abfurdities of their rites and ceremonics, and the criminal practices which were intermixed with them, muft have altogether had a tendency to pervert both the reafoning and the moral principles of the buman mind. 'Tbe debaucheries of the monarch of the god., and the fidelity with which his example in that reffect was followed by the whole crowd of the infenior deities, did, we know, difpofe the devout heathen, when he felt the fame paffions which had afferted their power over the gods, to gratify them without fcruple. It is a truth, however, and we wiil not attempt to deny or conccal it, that the genius of the polytheifm of the Greeks and Romans was friendly to the arts; to fuch of them efpecially as are raifed to excellence by the vigorous exertion of a fine imagination ; mufic, poetry, fculpture, ardhitecture, and painting, all of thefe arts appear to have been confiderably indebted for that perfection to which they attained, efpecially among the Greeks, to the fplendid and fanciful fyftem of mythogy which was received among that ingenioas people.-

R.'irint. R-

Fat we cannit sive at ctaaily fivourabic account of us infuence on the fomecs. Fhare wats litale in that fyRem that could coatribute to call f the reaton. We If ab geant ir deed, that if re fon can be fo thocked with ahfordiey ats to be rouled to a more vigorous exertion of ler pulfoss, and a move determiand affertion of hor bights in conequence oflomeving it ; in that cate this fifen of mythology might Le furourable to the esercile and improvement of reafon ; not otherwil:.
"The cometion of pagatifim with morality was :00 i.mpureat for it to produce ang very iniportant effects - $\frac{1}{}$ the mo:als of tes vot:ries. Stac:ifices and prayers, mad temples and icftivals, not pusity of heart and mtegrity of life, were the me:ans prefribed for propitiathic the fovour of the dettios adored by the Pagans. Fincic were other means, too, belides true heroim and fatrintim, of gaining admilion into the Ely fan fields, or chatibing a feat in the comncil of the gods. Xenobhen, in one of the mot heantitul parts of his Memoirs of sicrates, reprefents Hercules wood by Virtue and licatore in two fair female forms, and deliberating with nuth anxiety which of the two he thould prefer. But this is the fiction of a philofopher detirous to improve the fables of antiquity in fuch a way as to render them teuly ufeful. Hercules does not appear, from the tales which are told us of his adrentures, to have been at any fuch pains in choofing his way of life. He was received into the palace of Jove, without having occafion to plead that he had through life been the faithful follower of that goddefs to whom the philofopher makes him give the preference; his being the fon of Jove, and his wild adventures, were fufficient withont any other merits to gain him that honour. The fame may be faid concerning many of the other demi-gods and heroes who were advanced to heaven, or conveyed to the blefsfinl fields of Elyflum. And whatever might be the good elicets of the religion of Greece and Rome ir, general upon the civil and political eltablifhments, and in fome few infances on the manners of the people, yet \{ill it mut be acknowledged to have been but ill calculated to imprefs the heart with fuch principles as might in all circumllances direct to a firm, uniform, tenor of virtuous conduct.

But after what has been faid on the character of this seligion elfewhere (fee Polythersm), and in the ficond part of this article, we cannot without repetition enlarge farther on it here. Of the Jewith religion, however, we have as yet faid little, having on purpofe referved to this place whatever we mean to introduce under the article, concerning its influence on Sucicty.

3d, When we take a general view of the circumftances in which the Jewifh religion was ellablifhed, the effeis which it produced on the character and fortune of the nation, the rites and ceremonies which it enjoined, and the fingular political inftitutions to which it gave a fanction, it may perhaps appear hard to determine, whether it were upon the whole more or lefs beneficial to focicty than the folytheifm of the Egyp. tians, Greeks, and Romans. But if fuch be the judgement which preconceived prejudices, or an halty and carelefs view, have induced fome to form of this celebrated fyftem; there are others wio, with equal keennels, and founder reafoning, maintain, that it was happily calculated, not only to accomplith the great delign ot
preparisig the way for the promulgation of tlae Gofpel, Religion. but likewife to rader the Jews a more refined and virtuous people, and a betier regulated community, than any neighburing ation. In the firt place, the attributcs of the Beity were very elearly calibited to the Jews in the chlablithment of their religion. The mibacles by which le delivered them foni fervitude, and conducted them out of Egypt, were trihing demonftrations of his power ; that condefenfion with which he forvave thei: repeated atts of perverienefs and rebellion, was a mof convincing proct of his benerolence ; and the impartiality with whech the obfervance ald the violation of his laws were rewardicd and punifhed, even in the prefent life, might well convince thom of his juttice. A part of the laws which he diCated to Mo. les are of eternal and univerlal obligation; others of them were local and particular, fuited to the characker of the Jews, and their circumitances in the land of Ca natu. The Jewilh code, taken aliogether, is not to be confidered as a complete fyitem of religion, or laws calculated for all countrics and all ages of fociety. When we conlider the expediency of this fy ftem, we mult take care not to overlook the delign for which the Jews ane faid to have been feparated from other nations, the itcumftances in which they had lived in Egype, the cuftoms and manners which they had contrached by their intercourfe with the natives of that country, the nanner in which they were to acquire to themfelves fettlements by extirpating the nations of Canaan, the rank which they were to hold among the nations of Syria and the adjacent countries, together with the difficulty of reftraining a people folittle civilized and enlightened from the idolatrous worfhip which prevailed among their neigbours: All thefe circumftances were certainly to be taken into account ; and had the legillator of the Jews not attended to them, his inftitutions mult have remained in force only for a fhort period; nor could they have produced any lafting eftects on the character of the nation. With a due attention to there circumflances, let us defcend to an examination of particulars.

Although in every religion or fuperftition that has The Sabprevailed through the world, we find one part of its in-bath, fitutions to conlif in the enjoining of certain feftivals to be celebrated by relaxation from labour, and the performance of certain ceremonies in honour of the gods; yet in nonc, or almoft none befides the Jewifh, do we find every feventh day ordained to be regularly kept holy. One great end which the legillator of the Jews had in view in the inftitution of the Sabbath was, to imprefs them with a belief that God was the maker of the univerfe. In the early ages of the world a great part of mankind imagined the thars, the fun, the moon, and the other planets, to be eternal, and confequenty objects highly worthy of adoration. To convince the If. raelites of the ablurdity of this belief, and prevent them from adopting that idolatry, Molcs taught them, that thofe confpicuous objeets which the Gentile nations regarded as eternal, and endowed with divine power and intelligence, wore created by the hand of God; who, after bringing all things out of nothing, and giving them form, order, and harmony, in the fpace of fix days, refted on the feventh from all his works. Varions palfages in the Old Teftament concur to fhow, that this wats one great end of the inflitution of the Sabbath.

## に E L

$\underbrace{\text { Religion. }}$ tion of idolatrous worthip, are frequently inculcated together; and, asain, the breuch of the Sabbath, and the worihip of idols, are ufually reprobated at the fame time. Another good reafon for the inftitution of a Sabbath might be, to remind the Jews of their deliverance from bondage, to infpire them with humanity to frangers and domefties, and to mitigate the rigonts of fervitude.

The parpofes for which the other feftivals of the Jewifh religion were inflituted appear alfo of fufficient importance. The great miracle, which, atter a feries of other miracles, all directed to the lanic end, finally effected the deliverance of the Jews out of Egyr, ; and their actual departure from that land of fervitude, might well be commemorated in the feal of the pallover. 'To recal to the minds of polterity the hiftory of their ancefors, to imprefs them with an awfin and grateful fenfe of the gootnels and greanefs of God, and to make them think of the purpofes for which his a'mighty power had been fo fignally exerted, were furely good reafons for the inftitution of fuch a feltival. The lealt of Pentecoft celebrated the firt declaration of the law by Mofes, in the fpace of firty days atter the fealt of the paffover. It ferved alfo as a day of folemu thankfgiving for the bleflings of a plenteous harvelt. On the fealt of tabernacles, they remembered the wanderings of their anceftors through the wildernefs, and expreffed their gratitude to heaven for the more comfortable circumfances in which they found themfelves placed. The fealt of new moons ferved to fix their kalended, and determine the times at which the other feftivals were to be celebrated ; on it trumpets were founded, to give public notice of the event which was the caute of the feftival; no fervile works were performed, divine fervice was carefully attended, and the firt fruits of the month were offered to the Lord. The Jewifh legiflator limited his fettivals to a very frall number, while the heathens devoted a conliderable part of the year to the celebration of theirs. But we perceive the occafions upon which the Jewifh feltivals were celebrated to have been of fuitable importance; whereas thofe of the heathens were often celebrated on trifing or ridiculous occafions. Piety and innocent recreation fhared the Jewith feftival; the feftivals of the heathens were chief. ly devoted to debauchery and id!encfs.

The Hebrews had other folemn feafons of devotion befides the weekly Sabbath and thefe annual fefivals: Every feventh year they refted from labour: they were then neither to plough, to fow, nor to prune ; and whatever the earth produced fontanecully that jear belonged rather to Araagers, orphans, and the poor, than to the proprietors of the ground. On this year infolvent debtors were difcharged from all debts contrafted by purchafing the necelfaries of life: and the greatend of this releate from debts contraAted during the preceding fix years, appears to have been to prevent the Hebrew from flying to the Gentiles and forlaking his religion when embarraffed in his circumftances. None but native Ifraelites and profelytes of righteoufnefs were admitted to this privilege; it was refufed to Arangers, and even to profclytes of the gate. The jubilee was a feftival to be celebrated every fiftieth year. It produced the fame effeits with the fabbatical year as to seff from labour and the difcharge of debts; with this

## K E L

addition, that on the year of the jubitee flaves obsained R shici, their frcedom, and the lands reverted to the old proprictors. On the year of the jubilee, as on the fabbatieal year, the lands were to relt uncultivated, and linwfuits were now to terminate. The chief delign of this inflitution appears to have been, to preferve the order of ranks and property originally eftablifhed in the Ficbrew ftate. None but Itraelites or circumcifed convcrts could enjay the benefit of this inlitution; nor could even thefe hope to regain their eftates on the year of the Jubilee, if they fold them for any other purpofe but to fupply their necelfities. The law relative to ufiry was evidently founded on the fame plan of polity with refpest to property. To almon any other nation fuch a law. it mult be confelfect, would have been unfuitable and unjul: but as the Jews were not defigaled for a trading nation, they could have litie occa. fion $t \cdot$ borrow, mefs to relieve dilkefs; and as an indulgence to people in fuch circumltances, the Jew was forbidden to exact ufury from lis brother to whom he had lent money.

The Jewin legiflator, we may well think, would be difpoled to adopt every proper method to prevent his nation from falling away into the idolatry of heathen nations. Probably one reafon of the dillitactions between clcan bealts which they were permitted to eat, and urclean bealfs, the eating of which they were taught to confider as pollution, was to prevent them from convivial interccurfe with profane nations, by which they might be feduced to idolatry. We do not readly fit down at table with people who are fond of dithes which we regard with abhorrence. And if the Jews were taught in loathe the flefh of come of thofe animals which ware ameng the greatef delicacies of the Gen:iles, they would naturally of comfequence avoid futing down at meat with thim, either at their ordinary meals or at thofe entertainments which they prepared in honour of their deities; and this we may with good reafon confider as one happy mean to preferve them from idolatry. Befides, the Jews werc permitted, or rather injoined, to eat animals which the Gentiles reverenced as facred, and from which they religioully with-held all violence. Goats, fheep, and oxen, were worhipped in Egypt fee Polytheism and Pan) ; and feveral learned writers are of opinion, that Mofes directed his pecple to facrifice and eat certain of the favourite an:mals of the Egyptians, in order to remare from their minds any opinions which they might have otherwife entertained of the fanctity of thofe pretended deities. Many of the obfervanees which Mofes injoined with regard to food, appear to have been intended to infpire the Ifraelites with contempt for the fuperftitions of the people amons whom they had fo long fojourned. They were to kill the animal which the Egyptians worfhipped; to roalt the flefh which that people ate raw; to eat thehead, which they never ate; and to dref's the entrails, which they fet apart for divination. Thefe diftinctions concurred with the peculiarities of their drefs, language, government, cuttoms, places, and times of worfhip, and even the natural fituation of their country, by whicl they were in a maner 'confined and fortified on all fides, to feparate them in fuch a manner from neighbouring nations, that they might eicape the infection of their idolatry. And if we reflect both on the defign for which Providence feparated the Ifraelites from othes

$\underbrace{\text { Religion. }}$
fuch a fyftem to le. It would be unhappy, indeed, if, on a comparifon of pure theifm with prlytheim, the later, with all its abfurditics, fhould be found more beneficial to mankind than the former. The theifm of the Jews was not furmed to be diffeminated through the earth; that would hare been inconfitent with the purpofes for which it is faid to have been defigned. But while the Jews were feparated by their religion from all other nations, and perhaps, in fome degree, fixed and rendered ftationary in their progrefs towards refinement, they were placed in circumftances, in refpect to h.ws, and gevernment, and religion, and moral light, which might with good reafon render them the envy of every other nation in the ancient world.
IV. The Chriftian religion next demands our atten. tion. It is to be confidered as an improvement of the Jewifh, ir a new luperfrusture raifed on the fame bafis. If the effects of the Jewifh religion werc beneficial to thofe anoong whom it was eftablifhed, they were confined almoit to them alone. But is the fyirit of Chrillianity equally pure and bemgnant? Is its influence equilly beneficial and more diffufive than that of Judaifm? Does it realiy merit to have triumphed over buth the theifm of the Jers and the polythifm of the heatheus?

If we confider the doetrines and precepts of the ChriItim reigion, mothinr can be more happily calculated to raife the dignity of human nature, and promote the happincts of mankind. The happinels of the individual is bet promoted by the exercife of love and gratitude towards God, and refignation to his providence; of humanity, integrity, and good will towards men; and by the due government of our appetites and paflions. Social happinefs again proceeds from the members of fociety entertaining a difinterefted regard for the public welfare; being antively induftrious each in his proper fphere of exertion; and being ftrictly juft and faithtul, and generoufly benevolent in their mutual intercourfe. The temor of the Gofpel inculcates thefe virtues; it feems evcrywhere through the whole of the Chriftian code to have been the great defign of its Author to infipire mankind with niild, benevolent, and peaceable dif. pofitions, and to form them to courteous manners. Chrilitinity again reprefents the Deity and his attributes i., the faireft light; even fo as to render our ideas of his nature, and the manaer in which he exerts his power, confittent with the moft correct principles of morality that can be collected from all the other religions that have prevailed in the earth, and from the writings of the moft admired philofophers. The ritual obfervances whicb Chrittianity enjoins are few in number, eafy to perform, decent, exprellive, and edifying. It inculcates no duties but what are founded on the principles of human nature, axd on the relation in which men fand to God, their Creator, Redecmer, and Sanctifier ; and it preicrites accurate tules for the regulation of the conduat. The alittance of the fpirit of Gud is promifed in this facred volume to the ie who aifiduoufly labour to dfeharge the duties which it enjoins; and it exhibits a friking example of fotlefs pusity, which we may fafely venture to irnitare. The gofeel teaches that worldly aflictions are incident to both grood and bad men; a doftrine highly conducive to virtue, which confoles us in diftrefs, prevents defpair, and encourages us to perfin firmly in our integrity un-

Vol. XVI.
 fame falvation, and levels all diftinctions of rich and poor, as accidental and infignificant in the fight of him who rewards or punifhes with inpartiality according to the metits or demerits of his cleatures. This doctrine is highly favourable to virtue, as it tends to humble the proud, and to communicate dignity of fentiment to the lowly ; to render ptinces and inferior magifrates moderate and juit, gentle and condefcending, to their inferiors. It farther requires hußands to be affecticnate and indulgent to their wives, wives to be faithful and refpecful to their hufbands, and both to be true and conflant to each other. Such is the purity of the Go§pel, that it forbids us even to harbour impure thoughts * it requires us to abandon our vices, however dear to us; and to the cautious widom of the ferpent it directs us to join the innocent fimplicity of the dove. The Chrillian difpeufation, to prevent a perfeverance in immorality, offers pardon for the pan, provided the offender forlake his vicious practices, with a firm refulution to act differently in futurc. The fanctions of the: Gofpel have a natural tendency to exalt the mind above the paltry purluits of this world, and to render tha Chriftian incorruptible by wealth, honours, or pleafures. The true Chriftian not only abfains from injultice towards others, bat even forgives thofe injuries which he himfelf fuffers, knowing that he cannot otherwife hope for forgivenefs from God. Such are the precep:s, fuch the ipirit, and fuch the gereral tendency of the Gofpel. Even thofe who refufed to give credit to its doctrines and hiftory have yet acknowledged the excellence of its precepts. They have acknowledged, that " no religion ever yet appeared in the world of which the natural tendency was fo much dirented to promote the peace and happinefs of mankind as the Chrifian; and that the Golpel of Chrif is one continued leffon of the flricteft morality, of juftice, benerolence, and univerial charity." Thefe are the words of Bolingbroke, one of its keenelt and moft inlidious opponents. Without examining the effects of this religion on fociety, we might almoft venture to pronounce with confidence, that a religion, the precepts of which are fo happily formed to promote all that is juft and excellent, cannot but be in the highef degree beneticial to mankind. By reviewing the effects which it has actually produced, the firourable opinion which we naturally conceive of it, after confidering its precepts, cannot but be confirmed.
One circumflance we muft take notice of as rather unfavourable to this review. It is really impoffible to the vir do juftice to Chriftianity by fuch a difcultion of its me- conmends rits. The virtues which it has a natural tendency to unofterproduce and cherifh in the human heart, are not of a noify oftentatious kind; they often efrape the obfervation of the world. 'Tcmperance, gentlenefs, patience, benevolence, juftice, and general purity of manners, are not the qualities which inof readily attrat the admiration and obtain the applaule of men. The man of Rufs, whom Mr Pope has fo jully celebrated, was a private character; his name is now likely to live, and his virtues to be known to the lateft pofterity: and yet, however difinterefted his virtues, however bencficial his influence to all around him, had his character not attraded the notice of that eminont poet, his name
roule

## REL [ 7t ] REL

Rellging. would perhaps ere this time have been lof in oblivion. Ind:widua!'s in private lifc feldonn engage the attention of the hilterian; his objest is to record the astions of princes, warriors, :und fatefmen. Had not the profefiors of Chrifitinity in the carlier ages of its cextlence been expofed to perfecurions, and unjult accuftions fion which they were called on to vindicate themfelves, we thould be fromgers to the vames and virtues of fuints and martyrs, and to the learning and endowments of the firft apologills for Crilianity. We can therefore only trace the general influence of the inftitutions of Chrifitianity on feciety. We cannot hope to make an accurate enumeration of particulars. In many of the countrics in which it has been effablifhed, it has produced a very fivourable ehange on the circumplances of domsitic life. Polygany, a prattice repugnant to the will of our Creatnr (fee Polygamy), who has declared his intentions in this irdance in the plainelt manner, by caufing nearly equal numbers of males and females to be brought into the world, was never comjhetely abolithed but by Chriltianity.

The practice of divorce, too, though in fome cafes proper and even necenfary, had been to much abufed at the time of our Saviour's appearance in the world, that he found reafon to declare it unlawful, unlefs in the cafe of adultery. The propricty and reatonablenefs of this prohibition will fufficiently appear, if we confider, that when divorces are eafily obtained, both parties will often have nothing elfe in view at the period of marriage than the difolution of their nuptial engagements after a thort cohabitation ; the interefts of the hutbind and the wife will almoft always be feparate; and the children of fuch a marriage are fcarce likely to enjoy the cordial affection and tender watchful eare of either parent. The hufband in fuch a cafe will naturally be to his wife, not a friend and proteetor, but a tyrant; fear and deceit, not love, gratitude, or a fenfe of duty, will be the principles of the wife's obedience.

In another inflance, likewife, Chriftianity has produced an happy change on the circumftances of domeftic life ; it mutt be acknowledged to have contributed greatly to the abolition of flavery, or at lealt to the mirigation of the rigour of fervitude. The cuftoms and laws of the Romans in relation to flaves were cruel and fevere. Mafters were often fo inhuman as to remove aged, fick, or infirm flaves, into an ifland in the Tiber, where they fuffered them to perifh without pity or affiltance. The greater part of the fubjects of many of thofe republies which enjoyed the moll liberty, groaned under tyrannical oppreflion; they were condemned to drag out a miferable exiftence in hard labour, under inhunian ufage, and to be transferred like beafts from one malter to another The hardihips of flavery were eafed, not by any particular precept of the G cfpel but by the gentle and hurrane fpirit which breatbed through the general tenor of the whole fyftem of doctrines and precepts of which the Gofpel conifits. It mult indeed be allowed, that a trade in flaves is at prefent carried on by penple who piefume tin c.ll themfelves Chriftians, and protected by the legillature of Chriftian llates: but the fpirit of the Cliriftian code condemns the practice, and the true Chriltian will not engage in it.

Partly by the diret and confpicuous, partly by the feeret and unfeen, influence of Chriftianity fince its promulgation in the world, the hearts of men have been
gradually foftencd; even barbarians have been formed to midnefs and humanity ; the influence of felfithnefs has been checked and reftrained; and even war, amid all the pernicions improvements by which men have fought to render it more terriblc, has :ffumed much more of the fpirit of mildnefs and peace than ever entered into it during the reign of heathenifm.

If we revicw the hillory of mankind with a view to theeir political circumfances, we lhall ind, that by fome means or other, it bas happened, fince the time when the Gofpel vas firt preached, that both fy fems of legiflature and forms of governmenthave beenraifedtermach greater perfecion, at leaft in thofe parts of the world into which the religion of Jefus has made its way, and obtained an eftablifhment.
The popular gnvernment of the Romans, notwithItanding the multiplicity of their laws, and the imperfcetions of their political conflitution, was, no doubt, happily enough adapted to promote the increafe of the power and the extenfion of the empire of Rome. In Greece there were various republics, the wifdom and impartiality of whofe laws have been highly celebrated. But we apprehend that there is a lufficient number of well authenticated fats, to warrant us to affirm, that fince Chriftianity has been propagated, and has had fufficient time to produce its full effect on arts, manners, and literature, cven under governments the form of which might appear lefs favourable than the celebrated models of antiquity to the liberty and happinefs of the people in general, thefe actually have been much better provided for than under the laws of Athens or Sparta, or even of Rome in the days of the confuls. It is a juf and happy nbfervation of Montefquieu, who has attributed fo much to the influence of climate and local circumftances, that " the mildnefs io frequently recommended in the Gofpel is incompatible with the delpotic rage with which an arbitrary tyrant punifhes his fubjeets, and exercites himedf in cruelty. It is the Chrifian religion (fays he) which, in Spite of the extent of empire, and the intuence of climate, has hindered defpotifm from being eftablithed in Ethiopia, and has carried into Africa the manners of Eurape. The heir to the empire of Ethiopia enjoys a principality, and gives to nther fubjeets an example of love and obedienceNot far from hence may be feen the Mahometan thutting up the children of the king of Sennaar, at whofe death the comucil fends to murder them in favour of the prince who afcends the throne. Let us fet befure our eyes (continues that eloquent writer), in the third chapter of the 24 th book of his Spirit of Laws, on me hand the coitinual maffacres of the kings and generals of the Greeks and Romans, and on the other the deflruction of people and cities by the famous conquerors Timur Beg and Jenghiz Kan, who ravaged Ana, and we flall perceive, that we owe to Chriltianity in government a certain political law, and in war a certain law of nations, which allows to the conquered the great advantages of liberty, laws, wealth, and alway's religion, when the conqueror is not blind to his own interef."

Thefe are the reflections of no common judge in this matter, but one who had long fludied the hifory of nations, and obferved the phenomena of the various forms of fociety, with fuch fuccefs as few others have attaincd.

## R E L

## R E L

But on no occafion has the mild influcnce of Chriftianity been mote eminenly dif layed, or more happily exerted, than in foftoning and humanizing the barbarians who overturned the Roman empire. The idolatrous religion which prevailed among thofe tribes before their converfion o Cliriftianity; inftead of difpofing them to cultivate lumanity and mildnefs of manners, contributed frongly to render them fierce and bloodthirfty, and eager to diftinguifli thenielves by deeds of favage valour. But no fooner had they fettled in the dominions of Rome, and embraced the principles of Chrillianity, than they became a mild and generous penple.

Ve arc informed by Molheim, who was at pains to collect his materials fr $m$ the moft authentic fources, that in the roth century Chrittian princes exerted themfelves in the converfion of nations whofe fiercenefs they had experienced, in order to foften and render them more gentle. The mutual humanity with which nations at war treat each other in modern times, is certainly owing, in a great meafure, to the influence of the mild precepts of the Gofpel. It is a fact worthy of notice too, that during the barbarous ages, the fpiritual courts of jultice were more rational and impartial in their decifions than civil tribunals.

How many criminal practices which prevailed among heathen nations have been abolifhed by their converfion to Chrifianity ! Chriftians of all nations have been obferved to retdin the virtues, and reject the vicions practices of their refpective countries. In Parthia, where polygamy prevailed, they are not polygamilts; in Perfia, the Chriftian father does not marry his own daughter. By the laws of Zoroafter the Perfians committed inceft until therembraced the Gofpel; after which period they abfained from that crime, and obferved the duties of chaftity and temperance, as enjoined by its precepts. Even the polifhed and enlightened Romans werc cruel and blood-thirfty before the propagation of the Gofpel. The breaking of a glafs, or fome fuch trifing offence, was fufficient to provoke Vidius Pollio to calt his flaves into fifh-ponds to be devoured by lampreys. The effufion of human blood was their lavourite entertainment ; they delighted to fee men combating with bealts, or with one another; and we are informed on refpectable authority, that no wars ever made firch harock on mankind as the fights of gladiators, which fometimes deprived Europe of 20,000 lives in one month. Not the humanity of Titus, nor the wifdom and virtue of Trajan, could abolifh the barbarous fpec. tacle. However humane and wife in other inftances, in this practice thofe princes complied with the cuftom of their country, and cxhibited fplendid fhows of gladiators, in which the combatants were matched by pairs ; who, though they had never injured nor offended each nther, jet werc obliged to maim and murder one another in cold blood. Chriftian divines foon exercifed their pens againf thefe horrid practices; the Chriftian emperor Conftantine rellrained them by edicts, and Honorius finally abolithed them. It would be tedious to proceed thrcugh an enumeration of particulars; but wherever Chritianity has been propagated, it has conflantly operated to the civilization of the manners of monkind, and to the abolition of abfurd and criminal practices. The Irih, the Scotch, and all the ancient inhabitants of the Britifh ifles, were, notwithftanding
their intercourfe with the Romans, rude barbaniars, till Relizinn. foch time as they were converted to Chriीianit: The inhuman practice of expofing infants, which once prevailed fo generally over the woild, and Itill prevails atmong fone Pagan nations, even under very humane and enlightened legiflatures, yielded to the influerice of Chitflianity.

Let us likewife remember, in honour of Chritianity, Learnine that it has contributed eminently to the diffufion of is nuth knowledge, the prelervation and the advancement of indebted to learning. When the barbarians overfpreal Emone, (hriftiwhat mult have become of the precious remains of po. lithed, enlightened antiquity, had there been no other depolitaries to preferve them but the heathen prielts? We allow that even the Romith clergy during the darkages did not Itudy the cclebrated models of ancient times with much advantage themfelves, and did not labour with much affiduity to made the laity accuainted with them. It mult even be acknowledged, that they did not always preferve thofe monuments of genius with fufficient care, as they were often ignorant of their real value. Yet, after all, it will be granted, it cannot be denied, that had it not been for the clergy of the Chrittian church, the lamp of learning would, in all probability, have been entirely extinguifhed, during that night of ignorance and barbarity in which all Europe were buried for a long feries of centuries, after the irruption of the barbarians into the Roman empire.

Such is the excellence of the Chriftian fyltem, and 51 fuch its tendency to meliorate the human charaser, the benethet its the human character, ficial infuthat its beneficial influence has not been confined to ence of thofe who have received its doetrines and precepts, and Chrifiahave profeffed themfelves Chrittians ; it has even produ- nity hasex ced many bappy effects on the circomftances and the characters of Pige even to it of oppore thofe whe tunities of beholding the virtues of Chriftians, and have not learning the excellence of the morality of the Gofpel. embraced Thofe virtues which ditinguifhed the character of the apoftate Julian were furely owing in no inconfiderable degree to his acquaintance with Chriftianity; and it is an undeniable fact, that after the propagation of Clariftianity through the Roman empire, even while the purity of that holy religion was gradually debafed, the manners of thofe Pagans who remained unconverted became more pure, and their religious doctrines and worthip lefs immoral and abfurd. - We might here adduce a tedious feries of facts to the fame purpofe. Whenever Chriftians have had any intercourfe with Pagan idolaters, and have not concealed the laws of the Gofpel, nor fhown by their condue that they difregarded them, even thofe who have not bcen converted to Chriftianity have, however, been improved in their difpofitions and manners by its infltence. The emperor, whofe virtues we have mentioned as ariling, in a certain degrec, from his acquaintance with Chriftiani$t y$, in a letter to an Heathen pontiff, defires him to turn his eyes to the means by which the fuperitition of Chriftians was propagated: by kindnefs to ftrangers, by fanctity of life, and by the attention which they paid io the burial of the dead. He recommends an imitation of their virtues, exhorts him to caule the priells of Galatia to be attentive to the worfhip of their gods, and authorifes him to ftrip them of the facerdotal function, unlefs they obliged their wives, children, and fervants,

Re:" zin. to pay attention to the fanse duties. He likewife en-- ~ー $j$ jin wiks of bencticence, defires the prielt to telieve the diniretied, and to baild houfes for the accommoder tion of thaneres of whatever religion; and fays, it is a diferace li.s l'agms to difreg.ad thofe of their own selistro, while Clirittims do kind uffices to ftrargers and enensi.s. This is inded an emment inftance of the hapy inflence of Cirdtianity even on the fentiments and in anners of thofe who regarded the Chrillian name with abhorrence.

Upin the whole then, may we not, from the particulars here cxhibited concerning the influence of this religion on the maners and happinels of men in focie. ty, conchude that Chriftanity is infinitely fuperior to the fuper llitiors of Paganifm? as being in its tendency uniformly favourable to the virtue and the happincts of mankind, and even to the fyttem of religion and laws delivered by Mofes to the children of Ifrael: becaule, white the religion of the Jews was calculated only for one particular nation, and it may almolt be fad lor one particular A.ige in the progrefs of fociety, Chriliani$t y$ is an univerfal religion, formed to exert its happy infuence in all ages and among all nations; and has a tendency to difpel the thades of barbarifm and ignorance, to promote the cultivation of the powers of the haman underflarding, and to encourage every virtuous refine. ment of manners.
V. Another religion, which has made and fill makes a conipicuous figure in the world remains yot to be examined. The religion of Mahomet is that which we here allude to. Whether we confider through what an extentive past of the globe that religion prevails, the political importance of the nations among whom it is profelled, or the Ariking peculiarity of chasucter by which it is diftinguifhed from all other religious fyftems-it is for all there reatons well worthy of particular notice. Like the Jewill religion, it is not barcly a fyttem of religious doctrines and general moral precepts ; it forms both the civil legitlature and the rejigious fytem of thofe nations among whom it is profelfed; and, like it too, it would appear to be calculated rather for one particular period in the progrefs of mankind from rudenefs to refinement, than for all ages mud all flates of focicty.

The hiftory of its oligin is pretty well known, and we have liad occation to enlarge upon it under a former arricle (iec Mahomet and Mahometanism). We we not hare to trice the insoftures of the prophet, or to conlider the arss by which he fo fuccefsfully accompl thed his defigns; but merely to confider the masality of his religien, and its infucnce on civil order and the happinets of fociety.
It is ircerd- If we riew the fate of the nations among whom it fy to grantancr, defpersim, and iry trieg. is eftabillicd, we canmot hefitate a moment to declare it friendly to ignmance, 10 defpotifm, and to impurity of manncers. The Touks, the Perlians, and the Malays, are all Mahometans ; and in reviewing their hiftory and contidering their profent It.ae, we mighe find it futhcient number of tacts to jutily the above affertion: and we mult not neglect to objerve, that, as thofe nat tions are not known to have ceer been lince their comberfanto lvahome anim under a much happier governrient, cr in as much more civilized Itate than at prefent, it camot be, with any degrec of fairnefs, argued, with relpef to Mahonictunifra as with refpeet to Chrifiani-
ty, that it is onls when its influence is fo oppofed by other caufes as to prevent it from producing its full effents, that it does not conduet thofe focieties among which it is cfablithed to an high fate ot civilization and refinement.

One, and that by ron means an inconfiderable, part of Remarks the Koran, was necalionally invented in folve fome dif- on the Koficulty with which the prophet found himfelf at the time perplexed, or to help him to the gratification of his ruling paffions, luft and ambition. When he and his followers were, at any time, untuccelisful in thote wars by which he fought to propagate bis religion, to prevent them from falling away into unbelief, or finhing into defpondency, he took care to intirm them that God fuffered luch misfortunes to befal believers, as it punifhment for their fins, and to try their fatt. 'The doctrine of predeftinati-n, which he alliduonfly inculc:ited, had an happy effect to perfuade lis followers to ruth boldly into the mida of death and danger at his command. Te prevailed with Zeyd to put away his wife, marricd her himfelf, and pretended that his crime lutd the approbation of heaven; and, in the Koran, he introduces the Deity approving of this marriage. Heing repulfed from the fiege of Misca, he made a leagne with the inhabitants ; but on the very next year, finding it convenient to furprife the city, by violating this treaty, he jullified his perfidy by teaching his followers to difregard promifes or leagues nate with infidels. In fome inttances again, we find abiurd prohibitions cujoined for limilar reafons: his officers, having on fome occafion drunk to excefs, excited much riot and confufion in the camp, he prohibited the ufe of wine and other incbriating liquors among his followers in future. Now, though it mult be acknowledged that many evils arife from the ufe of thele liquors, yet we cannot but think that, when ufed in moderation, they are in m.ny cafes bencficial to men: and certainly as much allowed by God as opium, which the Mahometans have fubftituted in their place.

Malnomet is allowed to have copied from the Chrifian and the Jewifh religions, as well as from the ido. latrous luperllitions which prevailed through Arabia,
 and thus to have formed a metley mixture of reafon and Chriftiabfurdity, of puse theifm and wild fuperftition. He confidered alfo the circumflates of his commtry, and the prejudices of his countrymen. When he attended Atitions of to the former, he was generally julicious enough to Arabia.
fuit his doctrines and decilions to them with fufticient fkill; the latter he alfo managed with the greateft art: but he entcred into accommodation with them in inA.ances when a truc prophet or a wife and upright legillator woukl furely have oppofed them with decifive vigour. Whace the prophet indulges his own fancy, or borrows from the fupentitions of his comotrymen, nothing can be more ridictlous than that thapody of lics, contradifions, and extravgent fables. which he delivers to his followers. Amazing are the abfurdities which he relates concerning the patriarcho, conconing Solomon, and concerning the amimals that were aftembled in Noa's ark.

But in the whole tiffice of abfurdities of which his Nutoon of fyftem confits, there is nothing mure ablind, or more heaven ond happily calculated to promote impurity of manners, than hell. his deferiptions of heaven and liell; the weas of future rewards and punilhments which le fought to imprefs

## 1 E L

Religion. on the minds of hisfollowers. Paradife was to abound with rivers, trces, fruits, and thady groves; wine which would not intoxicate was to be there plentifully ferved up to believers; the inhabitants of that happy region were all to enjoy perpetual youth; and their powers of enjoyment were to be enlarged and invigorated, in order that fo many fine things might not be thrown away upon them. "Intead of infpiritg the blefied inhabitants of paradife with a liberal tate for harmony and fcience, converfation, and friendhip (hays Mr Gibbon), Mahomet idly celebrates the pearls and ciaroonds, the robes of filk, palaces of marble, dithes of gold, rich wines, arificial dainties, numerous attendants, and the whole train of fenfual luxury.-Seventy two houris, or black-eyed girls of refplendent bemty, blooning youth, virgin purity, and exquifite fenfibility, will be created fir the uie of the meancift believer; a moment of pleafure will be prolonged for 1000 ycars, and his facultits will be increafed 100 fold, to render him worthy of his felicity." It mult be acknowledged that he allows believers other more refined chjoyments than thefe ; thus they are to fee the face of Gud morning and evening; a pleafure which is far to exceed all the other pleafurcs of paradife. The following is his defeription of the punifhments of hell: 'The wicked are there to drink nething but boiling ftinking water; breathe nothing but hot winds; dwell for ever in continual butning fire and fmoke; cat nothing but briars and thorns, and the fruit of a tree that rifeth out of the bottom of hell, whofe branches refemble the heads of devils, and whofe fruits fhall be in their bellies like furning pitch.

All that we can conclude from a general view of the religion of M.homet, from confidering the character of the prophet, or from reviewing the hiftory of the nations among whom it has been eltablifhed, is, that it is one tillue .f ablurdities, with a few truths, however, and valuable precepts incongruoufly intermixed; that a great part ol it is unfavourable to virtuous manners, to wife and equal laws, and to the progrefs of knowledge and refinement. It oten inculcates in a dired manner fentiments that are highly immoral; it finbilitutes trifling, fuperthitious obfervances in the room of genuine piety and moral virtue; and it gives fuch views of futurity as render purity of heart no neceflaty qualification fer feeing God.

Surely, theretore, even the deif, who rejects all but natural religinn, would not hefitate to pefer Chrifianity, and even Judarm, to the religion of Mahomet. Jndiaifn, calculated for a peculiar people, was undoubredly much more fublime and much more happily framed to render that people virtunus and happy in the circumftances in which they were placed; and Chritianity we find to be an univerfal religion, fuited to all circumfances and to all the flages of fociety, and acting, wherever it is received, with more or lefs force to the fupport of civil order, virtuous manners, improvement of arts, and the advancement of fcience. However, as Mahometanifm forms in fome medfure a regula. fyftem, as it has bunowed many of the precepts and doctrines of Judaifm and Chritlianity, not indeed without corrupting and dograding them; and as it has contributed confiderably to the fupport of civil government, alth ugh in a very imperfeat form, in thofe countries in which it has obtained an eflablifmment ; for all thefe

reafons we cannot but give it the preference to the fu- Religion perftitions of Paganifm.

II
Rembrand́t
The whole refult of our inquities under this article, 59 therefore, is, 1. That as man, by the conftitution of Conclufon. his mind, is naturally fitted for acquiring certain notions concerning the exiftence of invifible, fuperior heings, and their iufluence on human life; fo the religious ideas which se find to have in all arges of the world, and in all the different flages of the progrefs of fociety, prevailed among mankind, appear to have originated partly from the natural exertions of the hunan imagination, underftanding, and pafions, in various circumftances, and partly from lupernatural revelation.
2. That though religious opinions, together with the moral precepts, and the sites of worlhip connected with them, may appear to have been in numerous infances injurious to the virtue and happinefs of fociety; yet, as they have often cuntributed to lead the mind to form motal dilinctions, when it would otherwife in all proUability have been an entire Aranger to fuch diftinctions; and as they have always contributed in an effential manner to the eftablifhment and the fupport of civil government-it mutt therefore be acknowledged that they have always, even in their humbleft fate, been more beneficial than hurfful to mankind.
3. That when the different fytems of religion that have prevailed in the world are comparatively viewed with refpect to their influence on the welfare of fociety, we find reafon to prefer the polytheifm of the Greeks and Romans to the ruder, wilder, religious ideas and ceremonies that have prevailed among favages; Mahometanifm, perhaps in fome refpects, to the polytheifm of the Greeks and Romans; Judaifm however to Mahometanim ; and Chriftanity to all of them.

RELIGIOUS, in a general fenfe, fomething that relates to religion.-We fay, a religious life, religions fociety, \&c.-Churches and church-yards are religious places.-A religious war is alfo called a croifade. See Crolsade.

Religious, is alfo ufed fubflantially for a perfon engaged by folemn vows to the monallic life; or a perfon thut up in a monattery to lead a life of devotion and aufterity, under fome rule or intitution. The male religious we popularly call monks and friars; the female, nuns and canoneffis.

REMBRANDT (Van Rhin), a Flemith painter and encraver of great eminence, was born in 1606, in is mill upon the banks of the Rhine, from whence he derived his name of Van Rhin. This mafter was born with a creative genius, which never attained perfect:on. It was filid of him, that he urould lave invented painting, if he had not found it already difovered. Without ttudy, without the affifance of any malter but by his own inflinct, he formed rules, and a certain practical method for colouring; and the mixture produced the defigned effect. Nature is not fet off to the greatelt advantage in his pictures; but th.ere is fuch a triking truth and limplicity in them, that his heads, particularly his portraits, feem animated, and riling from the canvas. He was fond of Atrong contrafts of light and fhade. The light entered in his working-room oaly by a hole, in the manner of a camera obicura, by which be judged with greater certainty of his productions. This artift confidered painting like the fage,

## REM

Rembrand where the charanars do not Arike unkfis they are cxatserated. He did not purfue the method of the fle.
Remenibrancers. milh painters of finifhing his pieces. He fometimes gave his lipht fuch thick touches, that it feemed more
like modeling than painting. A head of his has been thown, the in le of which was as thick of paint, as that which he copied fromanare. He was told one day, that by his peculiar method of employing colours, his pieces appeared rugged and tmeven-he roplied, he was a painter, and not a dyer. He took a pleafure in dreffing his figures in an extrow linary manner: with this view he had colleted a great number of eaftern eapi, ancient armour, and drapery long lince out of falhion. When he was adviled to contult antiquity to attain a better talte in drawing, as his was ufually heavy and uneven, he took his commellor to the clofet where theie old wellments were depolited, faying, by way of derition, thofe were his antiqucs.

Rembrandt, like molt men of genius, had many caprices. Heing nae day at work, painting a whole family in a fingle piqure, word being brought him that liis monkey was dead, he was fo affeeted at the lof's of this animal, that, withuut paying any attention to the perfons who were fitting for therr piatures, he painted the monkey upon the fame canvas. This whim could not fail of difpleafing thofe the piece was defigned for: but he would not efface it, choofing rather to lofe the fale of his piclure.

This freak will appcar fill more extraordinary in Rembrandt, when it is couffidered that he was extremely avaricious; which vice daily grew upon him. He practifed various dratagems to fell his prints at a high price. The pullic were very defirous of purchafing them, and not without reafor. In his prints the fame tane prevails as in his pichures; they are rough and irregular, but picturefque. In order to heighten the value of his prints, and increafe their price, he made his fon fell them as if he had purloined them from his father ; others he expofed at public fales, and went thither himfelf in difguife to bid for them; fometimes he gave out that he was going to leave Holland, and fettle in another country. Thefe ftratagems were fuccefsful and he got his own price for his prints. At other times he would print his phates half finifhed, and expofe them to fale; he afterwards finifhed them, and they became freth plates. When they wanted retouching, he made fome alterations in them, which promoted the fale of his prints a third time, though they differed but little from the firft impreflions.

His pupils, who were not ignorant of his avarice, onc day painted fome pieces of money upon cards; and Rembrandt no fonner faw them, than he was foing to take them up. He was not angry at the pleafantry, but his avarice fill prevailcd. He died in 1674.

REMEMBRANCE, is when the idea of fomething formerly known recurs again to the mind without the operation of a like object on the external fenfory. Sce Memory and Reminiscence.

REMEMBRANCERS, in England, anciently called clerks of the remembrance, certain offieers in the exchequer, whereof three are diftinguifhed by the names of the king's remembrancer, the lord treafurer's semembrancer, and the ' $r e$ mesubrancer of the firfofruits. The king's remembrancer en. ters in his oflice all recognizances taken before the barons for any of the king's debts, for appearances or obferving
of orders; he alio takes all bonds for the king's debts, \&e. and makes out procelfes thereon. He likewife iffues proceftes againt the collect ors of the cuntoms, exeife, and others, for their accounts; and informations upon penal flatutes are entered and fued in his office, where all proccedings in matters upon Englifh bills in the ex-chequer-chamber remain. His duty further is to make out the bills of compofitions upon penal laws, to take the tatement of debts; and into his office are deliver. ed all kinds of indentures and other evidences which concern the affuring any lands to the crown. He every year in cralino animarum, reads in open court the ftature for elction of theriffs; and likewife openly reads in court the oaths of all the officers, when they are admitted
The lord treafurer's remembrancer is chargedto make out procelis agamit all flocrifts, efcheators, receivers, and bailifs's, for their accounts. He alfo makes out writs of ficri facius, and extent for debts due to the king, either in the pipe or with the auditors; and procefs for all fuch revenue as is due to the king on :account of his tenures. He takes the account of heriffs; and alfo keeps a record, by which it appears whether the fheriffs or other accountants pay their proffers due at Eafler and Michaelmas ; and at the fame time he makes a record, whereby the theriffs or other accountants keep their prefixed days: there are iikewife brought into his office all the accounts of cuftomers, comptrollers, and accounts, in order to make cretry thereof on records ; alfo all eftreats and amer cements are certified here, \&c.

The remembracer of the firf-fruits takes all compofitions and bonds for the payment of firft-fruits and tenths; and makes out procefs againit fuch as do not pay the fame.

REMINISCENCE, that power of the human mind, whereby it recoliects itfelf, or calls again into its remembrance fuch ideas or notions as it had really forgotten: in which it differs from memory, which is a treafuring up of things in the mind, and keeping them there, without forgetting them.

REMISSION, in phyfics, the abatement of the power or efficacy of any quality; in oppofition to the increafe of the fame, which is called intenfion.

Remission, in law, \&c. denotes the pardon of a crime, or the giving up the punilhment due thereto.

Remission, in medicine, is when a diftemperabates for a time, but does not go quite off.

REMITTANCE, in commerce, the traffick or return of money from one place to another, by bills of exchange, orders, or the like.

REMONSTRANCE, an expoitulation or fupplication, addreffed to the chief magiltrate, or other fuperior, befeeching him to reflea on the inconvenicnces or ill confequences of fome erder, edia, or the like. This word is alfo ufed for an expoftulatory counfel, or advice; or a gentle and handfome reproof, made cither in general, or particular, to apprize of or correct fome fault, \&c.

REMORA; or Sucking-rish, a fpecies of Echeneis. Many incredible thiugs are related of this animal by the ancients; as that it had the power of flopping the largeft and fwiftel veffel in its courfe : and even to this day it is afferted by the fiflermen in the Mediterranean, that it has a power of retarding the motion of their boats by attaching itfelf to them; for which
lRemens: lrancery H Remora.

## R E M

Remorfe, which reafon they kill it whenever they perceive this Remphan. retardation. But in what meanner the remora performs this, we have no account.

REMORSE, in its worlt fenfe, means that pain or anguifh which one feels after having committed fome bad action. It alfo means tendernefs, pity, or fympathetic forrow. It is molt generally ufed in a bad fenfe, and is applied to perfons who feel compunstion for fome great crime, as murder and fuch like. Murders which have been committed with the utmof circumpestion and fecrecy, and the authors of which could never have been diforered by any human invefigation have been frequently unfolded by the remorfe and confeffion of the perpetrators, and that too, many years afterwards. Of this there are numerous infances, which are well authenticated, and which are fo generally known that it is needlefs to relate them here. Sce $R_{\mathrm{v}}$. PENTANCE.

REMPHAN, an idol or Pagan god whom St Stephen fays the Ifraelites worfhipped in the wildernefs as they paffed from Egypt to the land of Promife: "Yea, ye took up the tabernacle of Moloch, and the far of your god Remphan; figures which ye made to worfhip them." That the martyr here quotes the following words of the prophet Am:s, all commentators are agreed : "Ye have borne the tabernacle of your Moloch, and Chiun your images, the far of your god, which ye made to yourfelves." But if this coincidence between the Chriftian preacher and the Jewifh prephet be admitted, it follows, thai Ch:un and Remphan are two names of one and the fame deity. This is indeed farther evident from the L.XX. tranllators having fubfituted in their verion the word Paceav inflead of Chiun, which we read in the Hebrew and Englifh Bibles. But the queftion which Aill remains to be anfivered is, what god was worfhipped by the name of Remphan, Raiphan, or Chiun? for about the other divinity here mentioned there is no difpute. See Moloch.

That Chiun or Remphan was an Egyptian divinity, cannot be queftioned; for at the era of the Exodus the Hebrews mult have been frangers to the idolatrous worThip of all other nations; nor are they ever accufed of any other than Egyptian idolatries during their 40 years wanderings in the wildernefs, till towards the end of that period that they became infected by the Moabites with the worlhip of Bual-peor. That M.loch, MoSeck, Melck, or Milcom, in its original acceptation denotes a king or chief, is known to every oriental fih lar; and therefore when it is ufed as the name of a god, it undoubtedly fignifies the fur, and is the fame divinity with the Esyptian Ofiris. Reafoning in this way many critics, and we believe Seldon is in the number, have concluded that Chiun, and of courfe Remploan, is the planet Saturn; becaufe Cbiun is written Ciun, Cenan, Ceuan Chevvin; all of which are modern oriental names of that planet.

But againf this hypothefis infurmountable objections prefent themfelves to our minds. It is univerfally allowed (fee Polytheism), that the firfoobects of idolatrous wor hip were the fun and moon, conflidered
as the king and queen of heaven. The fixed fars, in- R-mphar: deed, and the planets, were afterwards gradually admitted into the Pagan rubric ; but we may be fure that thofe would be firft affociated with the two prime luminaries which mof refembled them in brightnefs, and were fuppofed to be moft benignant to man. But the planet Saturn appears to the naked eye with fo feeble a luftre, that, in the infancy of aftronomy, it could not make fuch an impreffion on the mind as to excite that admiration which we muft conceive to have always preceded planetary worfhip. It is to be obferved, too, that by the Pagan writers of antiquity Saturn is couttantly reprefented as a flar of baleful influence. He is termed the leaden planet; the planet of malevolent a/pect; the difmal, the ixisumane far. That the Egyptians, at fo early a period as that under confideration, fheuld have adored as one of their greatelt gods a planet obfcure in its appearance, diftant in its fituation, and baleful in its influence, is wholly incredible.

There is, however, another far which they might naturally adore, and which we know they actually did adore, as one of their moft beneficent gods, at a very early peried. This is the astpaxuay or oupros of the Greeks, the canis or Mella canicularis of the Romans, and the dog-far of modern Europe. By the Egyptians it was called Sothis or Soti, which fygnifies fafety, beneficence, fecundity; and it received this name, becaufe making its appearance in the heavens at the very time when the Nile overflowed the country, it was fuppoled to regulate the inundation. On this account Plutarch (If. et Ofir.) tells us, they believed the foul of their illuftrious benefactrefs $I f / 1$, to have tranfmigrated into the Itar Sothis, which they therefore worlhipped as the divinity which rendered their country fruifful. It made its appearance, too, on the firt day of the month $T$ hoth ( A , which was the beginning of the Egyptian year, and as fuch celebrated with feafting and feftivity; and being by much the brighteft ftar in the heavens, Horopollo (cap. 3.) informs us it was confidered as fovereign over the reft. A combination of fo many important circumftances might have induced a people leis fuperfitious, than the Egyptians to pay divine homage to that glorious luminary, which was confounded with Ifis, who had been long regarded with the highef veneration; and as Ifis was the wife and fifter of Ofiris, and always affociated with him, the flar of Ifis or Remphan was naturally afociated with Moloch, the fame with Ofiris.

But it will be afked, how the far which by the E. gyptians was called Soth or Sothis came to be worthipped by the Hebrews under the appcllation of Cibiun or Remphan? This is a very pertinent queftion, and we Thall endeavour to anfiver it.

Every one knows that the pronunciation of oriental words is very uncertain; and that as the vowels were often omitted in writing, it is of very little importance to the meaning how they be fupplied, provided we rea tain the radical confonants. The word Chiun may with equal propriety be written Kiun, Kion, or even Kyon,
(A) This was the cafe at a very remote period; but it is otherwife at prefent, owing to the Precessiov of the Equinoxes. See that article.

Nemilar. the Hebrem jos being convertible in:n the Greek or the Kiumany; but the wards Ciath, Ch.an, Kiln, or Khan,
 fignifying Mcal, Chiof, Prinae, King, ice are dirtufcd thenels a great p.at of Alia and Curope. In the Chincte hangunge suin, which tiguities :a King, is fit timilar to the woid Chikin or Kikiun under corfideration, that no etymolegin will heritate to pronoance thems of the fane oriminal ant the fame import. The wo d Kirn or Khun is univerfilly known to be an honorary tiile in Tartary ; and Kirian or Killn, which is manieftly cognate of the word Chiun or Kiur, is, in the Paferi or old Perfian langurge, the epithet applied to the dymaty of prinees which fucceded Cyms the Great. Among the Scythans or ancient Tartars, Chian fignifies the Sun and likevife the diay; and Kung, Kinung, Kim, rums through all the dialefo of the Gothic therue, every whire denotiag at chi:f or foverecion. In thec Syain dialcet, Koa f:gnities a prince; and hence the A'mighey is Aylea (Gen. xiv. 19.) Konah, which is tramhated poffir $r$, but might have, with perhaps more ph priety, been rendered Sorerign of heaven and earth. In Hebsew, the word Kikhun or Kaben, which is the very fume with Khan or ham, fignifies either a $p_{1}: J l$ or a prince; and in Esypt Kion was the name of the firlt Herculcs or the fun. Hence the fame word in compofition denotes greatnefs, as Can-olus the great ferpent; Can-athoth, the great Thoth or Mercury ; Cathgiris, the great Ofiris.

From this deduction we would conclude, that the word, which is found in fo many mongues, and always denotes $C$ lifo, Prince, Sovercigut, is the very word Chiun which the LEyyptians and Hebrews applied to Sothis, as being, in their conceptions, the chiet or fovereign of all the fars. This will appear Aill more probable, when we have afcertained the import of the word Remphan, or, as the LXX have it, Raipban.

Phan, thic latter part of this word, is unqueftionably the fame with Pan, the molt ancient of the Egyptian yrods (ice PaN). It is likewife a connate of the Hehrew Phanah, confpexit, fpectavit, vidit; and the radical word feems to be PHAH, which fignifies fometimes the counterance, and fometimes light. Hence Pbuetbon, which is compounded of pha light, eth or eflo fire, and onftrength, came to be one of the names of the fun. Rut, whic 1 we commonly write Rajah, has long lignificd, among the Indians, a fuburdinate prince; and we know, that between India and Egopt there was a very early intercourfe. Raipisin, therefore, may be cither the royal light or the bright prince, fubordinate to Otins; and in either fenfe, it was a very proper epthet of Sothis in the Egyptian kalendar. The word Rem or Rom, again (for it i , fometimes written Remphan, and fometimes Rompha), is no other than the Hebrew En Rum "high, cxalted." Fience Remphn in the high or exalte l ligh, which Sothis certainly was.

For this cty mological diffuifition we are indebted to Dr Doig, the learned author of Lethers on the Satage State, who bis writen a dilfertation on Chiun and Remphan, of fuch value that we hope it will not be much longer with-held from the public. The afcertaining the identity of thof names, and the god to which they belonged, is the leaf of its merit; for it will be found to throw' much light upon many palfages in the Old I'cliament. What confirms lis interpretation is, that the
idol confecrated by the Egyptians to Sathis or the deg. Removing Har, was a fomale figure with a flar on her head; and Nenfer hence the prophet uphraids his countrymen with ha- Renfew ving borne the Star of their decty.

Acrion of kEnioilligg, in Scoss law. See Law, N clavii. is.

RI:MIURIA, fertivals efabtifhed at Rome by Romulus to appeafe the manes of his brather Remus. They were afterwards called I - muri., and celebrated ycarly.

REMUS, the brohler of Romulus, was expoled to. gether with his blother by the cruelty of his grandiathat. In the contelt which happened hetween the two brothers about building a city, Romulus obtained the preturence, and Remns, for ridiculing the rifing walls, was put to death by his brothe:'s orders, or by Rumulus himfelf (fee Ronulus). The Romans were alilicted with a plague after this murder; upon which the oracle was conitited, and the manes of Remus appafed by the inthtution of the Remuria.

RENAL, fomething belonging to the reins or Kidneys.

RENCOUNTER, in the military art, the encomnter of two litele bodies or partics of forces. In which fenfe rencountur is ufed in oppofition to a pitched battle.

Rencounter, in fingle combats, is ufed by way of contraditination to vuel.- When two perfons fall ont and light on the fiput with ut having premeditated the corabat, it is called a ren ounter.

RENDEZVOUS, or Rendevous, a place appointed to meet in at a certain day and hoar.

RENEALMIA, in botany ; a genus of the monogynia order, belunging to the monandria chas's of plants. The corollh is trifid ; the nect.rium oblong ; the calyx monophyllous; the anthera felitle, oppofite to the nectarium ; the berry is flethy. There is only one fpecies, which is a native of Surinam.

RENEGADE, or Renegado, a perfon who has apofatized or renounced the Cirintian faith, 10 cm brace fome other religion, particularly Mahometanifm.

RENFREW, the county town of Renfrewhire, Aanding on the finall river Catheart, which Rows into the Clyde at the diftance of five miles from Glafgow, is a inall but ancient royal borough, the feat of the Alcrift's court and of a pribytery. The town is neatly b ilt, and the inhabitants cnjoy a tolerable flaze of conimerce.-Renfrew was oricinally joined to Lanerk, but was made an independeat therifldom by Robert II. who lad a palace here. W. Long. + 26. N. Lat. 55 - 51. RENFREWSHTRE, a county of Scotland, HyJed by way of emineace the larony, becaufe it was the ancient inheritance of the Stcwarts, is a imall county, extending about 20 miles from north to fouth, and 13 from eaft to well, parted from Dumbartonltire by the river Clyde on the weft, bordering on the eaft with Lanerkllire, and on the north with Cunningham. The face of the country is varicd with hill and vale, wood and ftrean ; crowded with populous villages, and adorncd with the feats of gentemen. The foil is in gener:l fertle, producing rye, barley, oats, peafe, beans, flax, and fome wheat: it likewife sields plenty of coal, and turf for fucl: and affords abundance of pafturage for theep and cattle. The inhabitants are Lowlanders and Prelbyterians; wealthy and induftrious, addicted to trafic, and particularly expert in the linen manufacture.

No aet of parliament in England fhall be repealed th.e Repulicuts fame fellion in which it was made. Adced or will may be repealed in pait, and fland good for the reft. It is held that a pardon of felony may be repeaied on difprovirg the fuggeftion thereof.

REPELLEN 15 , in medicine, remedics which drive back a morbid humour into the mals of Llood, fron whence it was unduly fecreted.

REPENTANCE, in general, means forrow for any thing palt. In theology it me:ns fuch a forrow for fin as produces nownefs of life, or fuch a conviction of the evil and danger of a fintul courfe as is fufficient to produce fhame and forrow in the review of it, and effectual refolutions of amendment. In this fenfe the evangelical writcrs ufe $\mu$ erapestia and puravoia. See Penitence and Theologs.

REPERCUSSION, in mulic, a frequent repetition of the fame found.

REPERTORY, a place whercin things are orderly difpofed, fo as to be eatily found when wanted. The indices of books are repertories, fhowing where the matters fought for are treated of. Common-place books are alio kinds of repertories.

REPETITION, the reiterating of an action.
Repetition, in mufic, denotes a reiterating or playing over again the fame part of a compofition, whether it be a whole ftrain, part of a frain, or double frain, \&ec.

When the fong ends with a repectition of the firt Atrain, or part of it, the repetition is denoted by da capo, or D. C. i.e. "from the beginning."

Repetition, in rhetoric, a figure which gracefully and emplatically repeats either the fame word, or the fame ferfe in different words. See Oratory, $n^{0} 67$ - 80.

The nature and defign of this figure is to make deep impreffions on thofe we addrefs. It exprefles anger and indignation, full affurance of what we affirm, and a vehement concern for what we have efpoufed.

REPHIDIM (anc. geog.), a ftation of the Ifraelites near mount Horeb, where they murmured for want of water; when Mofes was ordered to fmite the rock Horeb, upon which it yielded water. Here Jchlua difcomfited the Amalekites. This rock, out of which Mofes brought water, is a fone of a prodigious height and thicknefs, rifing out of the ground; on two fides of which are feveral holes, by which the water ran. ('Thevenot.)

REPLEGIARE, in law, fignifies to redeem a thing taken or detained by another, by putting in legal fureties.

De homine Replegiando. See Homine.
REPLEVIN, in law, a remedy granted on a difreis, by which the firft poffeffor has his goods reftored to him again, on his giving fecurity to the fheriff that he will purfue his astion againt the party diftraiwing. and return the goods or cattle if the taking them flall be adjudged lawful.

In a replevin the perfon diftrained becomes plaintiff; and the perfon diftraining is called the defendunt or avaruant, and his jultification an azozury.

At the common law replevins are by writ, either out of the ling's-bench or common-pleas; but by fatute, they are by plaint in the fheriff's court, and court-baron, for a perfon's more fpeedily obtaining the goods diftrained.

## R E 1

## Kepiery

 fricuc.If a plate in rebiesin be remored into the court of king's-bench, sic. and the plaintiff makes dciault and becomes non-fuit, or judgment is given againft lim, the delendanc in replevin fhall have the writ of retorn:o bioterm of the goods taben in diftrets. See the next :urticle.

REPLEV1, in Englifhlaw, is a tenant's bringing :t urit of replevin, or refegiari fucius, where his goods .ue taken by diltrefs for rent; which mutt be done within five day's after the diftefs, otherwife at the five days cud they are to be appraifed and fold.

This word is alfo ufed for bailing a perfon, as in the cale of a lomime reflegiumis.

REPOR'', the relation made upon oath, by officers or perfons appointed to vifit, cxamine, or cllimate the ftate, expences, Sce of any thing.

Repnrt, in Englifh law, is a public relation of cafes iudicioully argued, debated, refolved, or adjudged in any of che king's counts of jultice, with the caufes and reafons of the tame, as delivered by the judges. Alio when the court of chancery, or any other court, refers the llating of a cafe, or the comparing of an account, to a mafter of chancery, or other referee, his certificate thercon is called a ieport.

REPOSE, in poetry, \&ic. the fame with reft and paufe. Sce Rest, Exc.

Repose, in painting, certain mafles or large affemblages of light and fhade, which being well conducted, prevent the confufion of objeets and rigures, by engaging and fixing the eye fo as it cannot attend to the ether parts of the painting for fome time ; and thus lading it to confider the feveral groups giadually, proceeding as it were from ftage to ltage.

REPRESENTATION, in the drama, the exhibition of a theatrical pisce, together with the feenes, machinery, \&c.

REPRESENTATIVE, one who perfonates or fupplies the place of annther, and is invefted with his right and authority. Such, for infance, are the Reprefentatives of the Tinited States in Congrefs.

REPRIEVE, in criminal law (from reprendre, "to take back"), is the withdrawing of a fentence for an interval of time; whercby the execution is fufpended. Sic Jungment.
SHacht.
Tllis may bc, firf, ex arbitrio judicis, either before or aiver judgment: as, where the judge is not fatisfied with the serdite, ar the evidence is fufpicious, or the indiet. ment is infuficient, or he is doubtful whether the offunce be within e!ergy ; or fometimes if it be a fmall feiony, or d:y favourable circumfances appear in the roirairal's cherater, in order to give room to apply to the crown for cither ans abfolute or conditional pardon. 'lhefe anbitary reprieves may be granted or taken off by the juftices of ganl-delivery, although their foffion be frifted, and their commiltion expired: but this ralle:r by commun uf ege than of frigt tight.

Repricves may illin be ex nereftate legis: as where a woman is capitally convifted, and pleads her pregnancy. 'Though this is no caufe to fay judgment, yet it is 10 refpite the execution till fhe be delivered. This is a mercy dictated by the las of natue, in favorem prohis; and therefure no part of the blondy procecdings in the reign of Oucen Mary hath been more jufly deteftrd, than the crue'ty that was excreifed in the ifland of Guernfey, of burning a woman big with child; and,
when through the violence of the flanies the infant Reprieve, fpranc forth at the ftake, and was preferved by the by. Reprifals, ftanders, after fonse deliberations of the priens who :1ffified at the facrifice, they caft it into the fire as a young heretic. A barbarity which they never learned from the laws of ancient Kome; which direct, with the fame humanity as our own quod prognantis mulieris dumnata fenu differatur, quoad pariat: which doctrine has alfo prevailed in England, as early as the firft memorials of their law will reach. In cafe this plea be made in ftay of exceution, the judge muft direct a jury of twelve matrons or difereet women to inquire into the fact: and if they bring in their verdict quick suibh child (for barely with clidd, unlefs it be alive in the womb, is not fuf. firient), exccution fhall be faid generally till the neat feffon; and fo from felfion to feffion, till cither the is delivered, or proves by the courfe of nature not to lave been with child at all. But if the once hath had the benefit of this reprieve, and been delivered, and after. wards becomes pregnant again, fhe thall not be intitled to the benefit of a farther refpite for that caure. For the may now be executed belore the child is quick in the womb; and thall not, by her own incontinence, evade the fentence of jufice.

Another caufe of segular repricve is, if the offender become non compos between the judgment and the award of execution: for regularly, though a man be compos When he commits a capital crine, yet if he becomes non compos after, he thall not be indicted; if after indictment, he thall not be convicted; if after conviction, he thall not receive judgment; if alter judgment, he thall not be ordered for execution: for furiofus folo furore punitur; and the law knows not but he might have offered fonie reafon, if in his fenfes, to have ftayed thefe refpective proccedings. " It is therefore an invariable rule, when any time intervenes between the attainder and the award of execution, to demand of the prifoner what he hath to allege why execution flould not be awarded agranft him; and, if he appears to be infanc, the judge in his difcretion may and ought to reprice e him. Or, the party may plead in bar of execution; which plea may be either pregnancy, the king's pardon, an act of grace, or diverlity of perfon, viz. that he is not the fame that was attainted, and the like. In this laft cafe a jury fhall be impurelled to try this crllateral iflue, namely, the identity of his perfon ; and not whether guilty or imnocent, for that has been decided befure. And in thele collateral iffues the trial thall be inflanter ; and no time allowed the prifoner to make his defence or produce his witneffes, unlet's he will make oath that he is not the perfon attainted: neither thall ans peremptory chalienges of the jury be allowed the prifoner, though formerly fuch challenges were held to be allowable whenever a man's life was in quaftion. If ncither pregnancy, infanity, non-identity, nor other plea, will avail to avoid the judgment, and Atay the execution confequent thereupon, the laft and fureft refort is in the king's mof gracious pardon; the granting of which is the mont amiable prerogative of the crown. See the article Parnon.

REPRISALS, a right which governments claim of taking from their encmies any thing equivalent to what they unjaltly detain from them or thair citizens. For as the delay of making war may lometimes be detrimental to individuals who have fuffered by depredations

## R E P

Reprifals. from foreign potentates, our laws have in fome refpects armed the fubject with powers to impel the prerngative; by directing the minitlers of the crown to illue leters of marque and repridal upon due demand: the prerogative of granting which is ne:arly related to, and plainly derived frum, that other of making war ; this being indeed only an inc mplete fate of holtilities, and gencrally ending in a formal denunciation of war. Thefe letters ane granable by the law of nations, wheneror the fuljects of one thate are cpprefied and injured by thote of another; and jultice is cienied by that ftate to which the oppreflor belongs. In this cafe letters of marque and reprifal (words ufed as fynonymous ; and fignitying, the latter a taking in return, the former the palling the frontiers in order to fuch taking) may be obtained, in order to leize the bedies or goods of the fubjects of the offending tate, until fatisfaction be made, where ever they happen to be found. And indeed this cuftom of repaifls feems dietated by nature herfelf; fur which reafon we find in the molt ancient times very notable inltances of it. But here the neceflity is obvious of calling in the fovereign power, to determine when reprifals malay be made; elfe every private fufferer would be a judge in his own caufe. In purfuance of which principle, it is with us declared by the itat. 4 Hen. V. c. 7. that, if any fubjects of the realm are opprefled in time of truce by any foreigners, the king will grant marque in due firm, to all that feel themfelves grieved. Which furm is thus directed to be otferved: the fufferer muft firt apply to the lord privy-feal, and he fhall make out letters of requeft under the privy feal ; and it after fuch requeft of 1atisfaction made, the party required do not within convenient time make due fatisfaction or reflitution to the party grieved, the lord-chancellor flall make him out letters of marque under the great feal; and by virtue of thefe he may attack and icize the property of the aggreffer nation, without hazard of being condemned as a robber or pirate.

Reprisal, or Recaption, is a fpecies of remedy allowed to an injured perfon. This happens when any one hath deprived another of his property in goods or clattels perfonal, or wrong fully detains one's wife, child, or fervant: in which cafe the owner of the goods, and the hufand, parent, or matter, may lawfully claim and retake them, wherever he happens to find them; fo it be not in a riotous manner, or attended with a breach of the peace. The reafon for this is obvious; fince it may frequently happen that the owner may have this only opportunity of doing himfelf juftice: his goods may be afterwards conveyed away and deftroyed; and his wife, chilltren, or fervants, concealed or carried out of his reach; if he had no fpeedier remedy than the ordinary procefs of law. If therefore he can fo contrive it as to gain poffection of his property again, without force or terror, the law favours and will jullify his procceding. But, as the public peace is a fuperior confideration to any one man's private property; and as, if individuals were once allowed to uie private force as a remedy for private injuries, all focial jultice muft ceafe, the frong would give law to the weak, and every man would revert to a fate of nature; for thefe reatons it is provided, that this natural right of recaption fhall never be exerted, where fuch exertion mult occafion ftrife and bodily contention, or endanger the peace of fociety. If, for inftance, my horfe is taken
away, and I find him in a commor, a fair, or a public Repprohaim, I maly lawfully feize him to my own we: but I ton, cannot jullify breaking (pen a private fable, or cnter- Reproducins on the grounds of a third perfin, to take him, ex. tun. cept he be 1clonicully tholen; bat mult have recourfe to an action at law.

REPROBATION, in theolng:, mear.s the act of ahandoning, or tatic of being abandonee, theternal d.fteuction, and is applied to that decree or refol e witich Grid has taken frum all eternity to punifn fimers wio thall d:e in impenitence ; in which fenfe it is direaly oppofed to clection. When a fimer is fo hardened as in ieel no remorfe or mifgiving of confcience, it is conlidered as a figu of reprobation; which by the caluifs has been diftinguifhed into politive and negative. The firlt is that whereby God is fuppofed to create men with a politive and abolute reflution to dame thens eternally. This opinion is countenanced by Si Atiguitine and other Chrinian fathers, and is a peculiar tenet of Calvin and moll of his followers. The church of England, in The thirty-nine Articles, teaches fomething lite it ; and the church of Scoiland, in the Confefion of Faith, maintains it in the ftrongeft terms. But the notion is generally exploded, and is believed by no rational divine in either chusch, being totally injurious to the jullice of the Deity. Negative or conditional reprobation is that whereby God, though he has a tincere defire to fave men, and furnifhes them with the necellary means, fo that all if they will may be faved, yet fees that there are many who will not bo faved by the means, however powerful, that are afforded them ; tho' by other means which the Deity fees, but will not afford them, they might be faved. Reprobation refpects angels as well as men, and refpects the latter either fallen or unfallen. See Predestination.

REPRODUCTION, is ulially undertood to mean the reftoration of a thing before exifting, and fince deftroyed. It is very well known that trees and plants may be raifed from flips and cuttings; and fome late obfervations have fhown, that there are fome animals which have the fame property. The polype * was the *See Pefirt infance we had of this; but we had fcarce time lypus. to wonder at the difcovery Mr Trembley had made, when Mr Bonett difcovered the fame property in a fpecies of water-worm. Amongt the plants which may be raifed from cuttings, there are fome which feem to poffers this quality in fo eminent a degree, that the fmalleft portion of them will become a complete thee again.

It deferves inquiry, whether or not the great Author of nature, when he ordained that certain infetts, as thefe polypes and worms, fhould refemble thofe planis in that particular, allowed them this power of being reproduced in the fasie degree? or , which is the fame thing, whether this reptoduction will or will not take place in whatcver part the worm is cut? In order to iry this, lWr Bonett entered on a coulfe of many experiments on the water-worms which have this property. Thefe are, at their common growil, from two to three inches long, and of a brownilh colour, with a calt of reddill. From one of thele worms he cut off the head and tail, taking from each extremity only a fmall piece of a twelfth of an inch in length; but neither of thefe pieces were able to reproduce what was wanting. They both perifhed in about 24 hours; the tail firtt,

## K E P

Repredure and afterwards the hicad. As to the body of the worm tion.
fiom which thele pieces were feparated, it lived as well
as before, and feemed indeed to fulfer nothing by the lofs, the head-part being immediately ufed as if the head was thereon, boring the creature's way into the mud. There are, betides this, two other puints in which the reprodution will not take place ; the one of thefe is ab: ut the fith or listh ring from the head, and the other at the fame dilance from the tail; and in all probability the condition of the great artery in thefe parts is the cuufe of this.

What is faid of the want of the reprodutive power of thele purts relates onls to the hoad and tail ends; for as to the body, it feels very little inconvenience from the lofs of what is taken off, and very fpeedily reprodnces thofe purts. Where then does the principle of life relide in fuch worms, which, after having their heads (ut off, will have not only the fame motions, but even the inclinations, that they had before? and yet this diffieuley is very fmall, compared to feveral others which at the lame time offer thenfelves to our reafon. Is this wonderful reprodution of parte only a natural confequence of the laws of mation ? or is there lodged in the body of the creature a chain of minute buds or fhoots, al fort of little embryos, alheady formed and placed in duch parts where the reproductions are to begin? Are theie worms only mere machines ? or are they, like more perfect animals, a fort of compound, the fprings of whofe motions are attuated or regulated by a fort of foul? And if they have thamfelres fuch a principle, how is it that this priaciple is multiplied, and is found in crery feparate piece? Is it to be granted, that there are in thefe worms, not a fingle foul (ifit is to be fo callcd) in each, but that each contains as many fouls as there are pieces capable of reproducing perfeet :mimals? Are we to believe with Malpighi, that thefe forts of worms are all leart and brain from one end to the other! This may be; but yet if we knew that it was fo, we thould know in reality but very little the more for knowing it : and it feems, after all, that in cafes of this kind we are only to admire the works of the great Creator, and fit down in filence.

The nice fenfe of feeling in fpiciers has been much talked of by naturalifts; but it apears that thefe worms have yet fomewhat more furpiling in them in regard to this particular. 1f a piece of flick, or any other fubflance, te hrought near them, they do not flay for i's touching them, but begin to leap and fritk about as inon as it connes towards them. There want, however, fome father experiments to afcertain whether this be reatly owing in fecling or to light; for though we can difcover no diltinct orgins of fight in thele creatures, get they feem altected by the light of the fun or a candle, and always frik about in the fame manner at the ayproach or either; nay, even the moon-light has fume elfed up/ $n$ them.

A twiy of willow, poplir, or many other trees, being planted in the carth, takes rort, and becomes a tree, cvery piece of wish will in the fame manner produce other trees. The cafe is the fanme with thele worms: they are cut to pieces, and thefe feveral pieces bicome perfect animals; and cath of thefe masy be again cut into a number of pieces, each of which will in the fame manner priduec an animal. It had been fuppofed by towe tiat thefe worms were oviparous: but Mr Bo.
nct:, on cutting one of them to picecs, having obferved Reproduca flender fubftance, refembling a dmall filament, to move tion. at the end of one of the pieces, feparated it ; and on cxamining it with glaffes, found is to be : perlect worm, of the fame form with its parent, which lived and grew larger in a veffel of water into which he put it. Thefe fmall bodies are eafily divided, and very readily complete thembelves again, a day ufually ferving for the production of a head to the part that wants one; and, in general, the fmaller and fenderer the worms are, the fooner they complete themilves after this aperation. Whan the bodies of the large worms are examined by the microfenpe, it is vely eafy to fee the appearance of the young worms alive, and moving about within them: but it reqnires gieat precifion and exatnefs to be certain of this; fince the ramifications of the great attery have very much the apparance of young worms, and they are hept in a fort of comtinual motion by the fyftoles and diaftoles of the fevenal portions of the artery, which ferve as fo many heats. It is very cortain, that what we force in regard to thefe animals by cur operations, is done alfo maturally every day in the brooks and ditches where they live. A cuitions wherver will find in thefe places many of them without heads or tails, and fome without cither ; as alfo other fragments of varions kinds, all whichare then in the an of completing themfelves: but whether accidents have reduced them to this fate, or they thes purpofely throw off parts of their cwn body for the reproduction of more animals, it is not eafy to determine. They are plainly liable to many accidents, by which they lofe the feveral parts of their body, and mult perifh very early if they had not a power of reproducing what was 1 oft : they often are broken into two pieces, by the refiltance of fome hard piece of mud which they enter; and they are fubject to a difeafe, a kind of gangrene, rotting off the feveral parts of their bodics, and mult incvitably perifh by it, had they not this furprifing property.

This worm was a fecond inflance, after the polype, of the furprifing power in an animal of recovering its moft elfential parts when lof. But Nature does not feem to have limited her beneficence in this refpect to thefe two creatures. Mr Bonett tried the firme experiments on another fpecies of water-worm. differing fr m the former in being much thicker. This kind of worm, when divided in the fummer-feafon, very otten thows the fame property: for if it be cut into three or four pieces, the pieces will lie like dead for a long time, but afterwards will move about again; and will be found in this ftate of reft in have reenvered a head, or a tail, or both. After recovering their part, they move very little; and, according to this gutheman's experiments, feldem live more than a month.

It thould feem, that the more diflicult fucecis of this lat kind of worm, after cutting, and the long time it takes to recover the loft part,, if it co recover them at all, is owing to its thicknofs; lince we always fird in that fpecies of worms which fucceeds beft of all, that thofe which are thinneft always recover their pats much fomer than the others.
The water infects alfo are not the only creatures which have this power of recovering their lof parts. The earth aftords us fome already difovered to grow in this manner from their cuttings, and thefe not lefs deferving our admiration than thofe of the water : the

## R E P

Reproduc- common earth-worms are of this kind. Some of thefe tion. worms have been divided into two, other3 into three or four pieces; and fome of thefe pieces, after having paffed two or three months without any appearance of life or motion, have then begun to reproduce a head or tail or both. The reproduction of the anus, after fuch a ftate of reft, is no long work; a few days do it : but it is otherwife with the head, that does not feem to perform its functions in the divided pieces till about feven months after the feparation. It is to be obferved, that in all thefe operations both on earth and water-worms, the hinder part fuffers greatly more than the fore part in the cutting; for it always twifts itfelf about a long time, as if actuated by frong convullions; whereas the head ufually crawls away without the appearance of any great uneafines.

The reprodusion of leveral parts of lobters, crabs, \&c. makes alfo one of the great curiofities in natural hiltory. That, in lieu of an organical past of an animal broken off, another fhall rife perfectly like it, may feem inconfittent with the modern iyftem of generation, where the animal is fuppofed to be wholly formed in the egg. Yet has the matter of fact been well attefted by the fifherment, and even by feveral virtuofi who have taken the point into examination, particularly M. de Reaumur and M. Perrault, whofe fkill and exactnefs in things of this nature will hardly be queftioned. The legs of lobfters, \&c. confilt each of five articulations: now, when any of the legs happen to break by any accident, $a_{s}$ in walking, \&c. whicl frequently happens, the fracture is always found is be in a part near the fourth articulation; and what they thus lofe is precifely reproduced fome time afte:wards; that is, a part of a leg fhoots out, confifting of four articulations, the firt whereof has two claws as before; fo that the lofs is entirely repaired.

If a lobfter's leg be broken off by defign at the fourth or fifth articulation, what is thus broken of always comes again; but it is not fo if the fracture be made in the firit, fecond, or third articulation. In thofe cafes, the reproduction is very rare if things contimue as they are. But what is exceedingly furprifing is, that they do not; for, upon vifiting the lobfter maimed in thefe barren and unlappy articulations, at the end of two or three days, all the other articulations are found broken off to the fourth; and it is fufpected they have performed the operation on themfelves, to make the reproduction of a leg certain.

The part reproduced is not only perfectly like that retrenched, but alfo, in a certain fpace of time, grows equal to it. Hence it is that we frequently fee lobfters, which have their two big legs uneqnal, and that in all proporions. This tho:vs the fmaller leg to be a new one.

A part thus reproduced being broken, there is a fecond reproduction The fummer, which is the only feafon of the year when the lobters eat, is the mot favourable time for the reproduction. It is then performed in four or five weeks; whereas it takes up eight or nine mon hs in any other feafon. The fma!ll legs are fometimes reproduced; but more rarcly, as well as more flowly, than the great ones: the horns do the fame. The experiment is mof caflily tried on the common crab. See Metaphysics, p. 574. rote (f); and Phys10LOGY, $\mathrm{I}^{\circ} 26 \mathrm{~s}$.

REPTILES, in natural hiftory, a kind of animals Reprilos denominated from their creeping or advancing on the belly. Or reptiles are a genus of animals and infess,
$\underbrace{\text { R.pulfin. }}$ which, intead of feet, reft on one part of the body, while they advance forward with the eff. Such ate earthworms, inakes, caterpillars, \&\&c. Indeed, moft of the clafs of reptiles have feet; only thofe very fmall, and the legs remarkably fhort in propotion to the bulk of the body.
Naturalifts obferve a world of artful contrivance for the motion of reptiles. Thus, particularly in the earthworm, Dr Willis tells us, the whole body is only a chain of annular mufcles; or, as Dr Derham fays, it is only one coutinued fpiral mufcle, the orbicular fibres whereof being contracted, render each ring narrower and longer than before; by which means it is enabled, like the worm of an augre, to bore its paffage into the earth. Its reptile motion might alfo be explaired by a wire wound on a cylinder, which when flipped off, and one end extended and held faft, will bring the other near to it. So the earthworm having fhot out or extended his body (which is with a wreathing), it takes hold by thefe fmall feet it hath, and fo contracts the hinder part of its body. Dr Tyfon adds, that when the forepart of the body is ftretched our, and applied to a plane at a diftance, the hind part relaxing and thortening is eafily drawn towards it as a centre.

Its feet are difpofed in a quadruple row the whole length of the worm, with which, as with fo many hooks, it faltens down fometimes this and fometimes that part of the body to the pline, and at the fame time fretches out or drags after it another.

The creeping of ferpents is effected after a fomewhat different manner; there being a difference in their Aructure, in that thefe laft have a compages of bones articulated tngether.

The body here is not drawn together, but as it were complicated; part of it being applied on the rough ground, and the relt ejaculated and thot from it, which being fet on the ground in its turn, brings the other after it. The fpine of the b.ack varioufly wreathed has the fame effect in leaping, as the joints in the feet of other animals; they make their leaps by means of mafcles, and extend the plicx or folds. See Zoolo. Gy.

REBUBLIC, or commenwealth, a popular fate or government ; or a nation where the people have the governmert in their own hands. Sce Gorernment, Aristocracy, Democracy, and Monarchy.

Republic of Letters, a phrafe ufed collectively of the whole body of the Itudious and learned penple.

REPUDIATICN, in the civil law, the act of divorcing. Sce Divozce.

REPULSION, in phyfics, that property of bodies whercby they recede from each other, and, on certain occafions, mutually avoid coming isto contact.

Repulsion, as well as attraction, has of late been confidered as one of the primary qualities of all matter, and has been much uied in explaining the phenomena of nature : thus the particles of air, tire, fteam, eleatic fluid, \&ic. are all faid to have a repultive power with refreat to one another. - That this is the cafe with the air, and vapour of all kinds, is certain; becaufe when they are compreffed into a fmall foace, they expand

Reri．－wiol great force ：bat as to fire，light，an！cleíricity， （ure exerements fan ：maty，the mppontition of a repullive
 f．hemi wila the pheacman ，as has heen demontlrated
 i In in ：h fe Ande，air and llemm，where a repultive p wer meft mamitenty exthe，it is demonfla rate that the efpulion cambut le at foman quality，fince it can be i－cecofod tor a great degree ly heat，and ciminified hy cold：but it is impoiible that a priraty quality of matter can he increaled or dimisilad by any extermal （hemmanace whatever ；for whatuer property d：pe：ds ＂川 ancacmal citcuntlanees，is not a prinnary but afe－ conday cte．－The repultion of clectritied bodies is ex－
 is lefs fubject to inveltigation ；and the moft that cent lee liid concerning it is，that in many cales it feems to les the conlequance of a modilication of tire，and in （there of electricity．

REDUTTATION means credit，honour，or the charatar of good；and timee we are deltined to live in focisiy，is neect？ry and ufefil more or lefo to every laman being．The：c is no m．m，except one who is wergrown with pride and felf－conceit，ot whote acticus are bad，but pays attention to his teputation，and wilh． es to pollets the good opinion of his neighbours or the world．The love of replitation and of fame are mot pnwerful fprings of action；but though they proceed from the tame principle，the means of attaining them， and the effects of them，are not altogether the fame．

Many means indeed ferve equally to fupport the re－ putation and to increafe the fame，differing only in de－ grees；others，however，belong peculiarly enther to the one or to the other．An honeft reputation is within the reach of the bulk of mankind；it is obtained by the focial vir－ tues and the contlant practice of the common duties of lie．Thais lind of reputation indeed is neither exten－ tive nor b：illiant，but it is often the molt ufeful in point of happinefs．Wit，taleuts，and genius，are the necef－ inry requilites for fame；but thole advantages are per－ baps lefs real in their confequences than thofe arifing from a good reputation．What is of real ufe colts li：tle；things rare and fplended require the greateft la－ bour to procure，and yield perhaps amore ideal happi－ nefs．

Fame can be poffelfed，comparatively fpeaking，but by few individuals；as it requires either very fuperior abilities，fupported by great cfforts，or very fortunate circumfances．It is conftituted by the applaufe of namkind，or at leaft by that of a fingle nation；whillt reputation is of much lefs cxtent，and ariles from differ－ ent circumftances．＂lhat reputation which is founded on deceit and artifice is never fulid ；and the molt ho． nourable sill always be found to be the moll uleful． Livery one may fafely，and iadeed ought to，afpire to the confideration and praife due to his condition and merit ；but lie who afpires to more，or who feets it by duhonef means，will at length meet with contempt．

REQUEST＇，in lw，a fupplication or petition pre－ ferred to a prince，or to a court of juntice ；begging relief in fome concionable cafes where the common law grants no immediate redrefs．

Court of Requests（curia requifitionum）was a court of equity，of the fame nature with the court of chan－ cery，but inferior to it；principally inllituted for the reliel of fuch petitioners as in confcionable cafes addref－
fod then feives by fupplication to his majefty．Of this Requet． court the lurd privy－leal was chief judge，affilted by the Blacible． millers of requetts；and it had begimning about the 9 comment． 1En．V11．according to Sir Julius Cafar＇s trátate upon tisis dubject ：thourh Mr Gwyn，in his preface to his Readings，fath it began from a commilion fi：ft grant－ cd by hing Hemy VIII．－This court，laving affumed grest power to iffelf，io that it became burthenfome， JIFi／\％anno 40 and 41 Iiliz．ins the court of cons－ mon pieas it was adjudged upon tolemn argunene， that the cout oi requells was no court of judica－ ture，\＆ic．and by itat． $16 \$ 17$ Car．I．c．10．it was taken aw：

There are fill courts of requef，or coutes of con－ Cience，conlfituted in London and other triding and propulous diknects for the recovery ef fmall deb：s． The lint of thefe was ettablified in Lomion fo cally as the reign of Henry V111．by an att of their common council ；which however was cettanly infutlicient for that purpole，and illegal，till contirmed by fatute 3 Jac． I．c．15．which has fince been explained and amended by Ratute 14 Gen．II．c．10．The contlitution is this： two aldermen and four commoners fit twice a week to hear all caufes of debt not exceeding the value of forty fhillings；which they examine in a fummary way，by the oath of the parties or other winnelles，and make fuch order therein as is confiltent to equity and good confcience．The time and expence of obtaining this fummary redrefs are very inconfiderable，which make it a great benefit to trade；and therenpon divers trading towns and other ditriets have obtained ants of parlit－ ment for elfablafhing in them courts of confcience upon nearly the fame plan as that in the city of London．

Py 25 Geo．III．c． 45 ．（which is confined to profe． cutions in courts of confcience in London，Middlefex， aud the borough of Southwark），and by 26 Geo．LIL． c．38．（which extends the provilions of the former att to all other courts inflituted for the recovery of imall debts），it is enacted，that after the firlt day of Septem－ ber 1786 ，no perfon whofoever，being a debtor or de－ fendant，and who has been or thall be committed to any gaol or prifon by order of any court or commiffoners authorifed by any act or acts of parliament for conltitu． ting or regulating any court or courts for the recovery of imall debts，where the debt does not exceed twenty thillings，fhall be kept or continued in cuftody，on any pretence whatfoever，more than twenty days from the commencement of the lalt mentioned at ；or from the time of his，her，or their commitment to prifon：and where the original debt does not amount to or exceed the fum of forty thillings，more than forty days from the commencement of the faid act，or from the time of his， her，or their commitment as aforefaid；and all gaolers are thereby required to difch：arge fuch perfons accord－ ingly．And by feet．2．if it thall be proved to the ia． tistaction of the court，that any fuch debtor has money or goods which he has wilfully and fratudulently con－ cealed：in that cafe the court fhall have powcr to en－ large the aforefaid times of imprifonment for debts un－ der twenty fhillings，to any time not exceeding thirty days，and for debts under forty thillings，to any time not exceeding fixty days；which frid ground of further de－ tention fhall be fpecified in the faid commitment．And that（by leet．5．）at the expiration of the faid refpec． tive times of imprifonment，every fuch perfon thall im－ mediately be difcharged，without paying any fum of money，

Requiem money, or other reward or gratuity whatfoever, to the a very large produce upon an acre. The crop being, gaoler of fuch gaol on any pretence whatfoever; and every gaoler demanding or receiving any fee for the difcharge of any fuch perfon, or keeping any tuch perfon prifuner after the faid refpective times limited by the faid att, fhall forfeit five pounds, to be recovered in a fummary way before two juftices of the peace, one moiety thereof to be paid to the overfeers of the poor of the parifh where the offence thall be committed, and the other to the informer.

REQUIEM, in the Romifh hitory, a mafs fung for the reft of the foul of a perion deceafed.

RESCISSION, in the civil law, an action intended for the amnulling or fetting afide any contract, deed, \&c.

RESCRIPT, an anfwer delivered by an empernr, or a pope, when confulted by particular perfons on fome difficult queftion or point of law, to ferve as a decifion thereof.

RESEDA, DYER's-WEED, Tellosu-qued, Wild, or Wild-woadl : A genus of the order of trigynia, belonging to the dodecandria clafs of plants; and in the natural method ranking under the $5 t^{\text {th }}$ order, Mifocllanec. The calyx is monophyllous and partite ; the petals lanciniated; the capfule unilocular, and opening at the mouth. There are 11 fpecies; of which the moft remarkable is the luteola or common dyer's weed, growing naturally in wafte places in many parts of Britain. The young leaves are often undulated; the falk is a yard high, or more, terminated with a long naked fikike of yellowifh green flowers: the plant is cultivated and much ufed for dyeing filk an! wool of a yellow colour. The great recommendation of the plant is, that it will grow with very little trouble, without dung, and on the very wort foils. For this reafon it is commonly fown with, or immediately after, barley or oats, withont any additional care, except drawing a bufh over it to harrow it in. The reaping of the corn does it little or no hurt, as it grows but little the firt year; and the next fummer it is pulled and dried like flas. Much care and nicety, however, is requifite, fo as not to injure either the feed or flalk; or, which fometimes happens, damaging both, by letting it lland too long, or pul'ing it too green. To avcid thefe inconveniences, a better method of culture has been devifed. This new me. thod is to plough and harrow the ground very fine, without dung. as equally as poffible, and then fowing about it gallon of reed, whith is very fmall, upon an acre, fome time in the month of Augulf. In about two months it will be bigh enough to hoe, which milt be carefully done, and the plants left about fix inches afunder. In March it is to be hoed again, and this labour is to be repeated a hird time in May. About the clufe of June, when the flower is in full vigour, and the falk is become of a greenith-yellow, it fhould be pulled; a fufficient quantity of fems bcing left growing for feed till September. Py this means the flower and ftalk, bo h of them being carefully died, will fell at a grood price to the djers, who employ it confantly, and in large gunntitics; add to this, that the feed being ripe and in perfect order, will yield a very confiderable profit. In a tolerable year, when the feaf ns have not been unfavourable, the advantages derived from this vegetable will anfwer very well; but if the fummer flould be remarkably fine, and proper care is taken in getting it in, there will be
as has been thown, to early removed, the ground may be conveniently prepared for growing wheat the next ge.rr. Upon the whole, weld is in its nature a very valuable commodity in ma:ly refpetts, as it ferves equally for woollen, linen, or filk; dycing not only a rich and lafting yellow, but alio, properly managed, all the different thades of yellow with brightnefs and beaney; and if thefe be previoully dipped blae, they are by the weld changed into a very pleafing green, which the artifts can alfo diverfify into a great variety of fhades.

RESEMbLANCE, and Dissimilitude, the relations of likenefs and difference among objects. See Comparison.

The cunnedion that man hath with the beings around Elem. of him, requires fome acquaintance with their nature, their Criticifiu. powers, and their gualities, for regulating his conduct. Fur acquiring a branch of knowledge fo effential to our well-being, motives alone of reafon and intereft are not fufficient: nature hath providentially fuperadded curiofily, a vigorous propenlity, which never is at reft. This propenfity alone attaches us to evcry new obeet $\dagger$; and +Sec Noincites us to compare objeas, in order to difeover their vilty. differences and reiemblatices.

Refemblance among objeits of the fame kind, and difimilitude among objects of different kinds, are too obvious and familiar to gratify our curiofity in any degree: its gratification lies in difcovering differences among things where refemblance prevails, and refemblances where difference prevails. Thus a difference in individuals of the fame kind of plants or animals, is deened a difcovery, while the many particulars in which they agree are neglected ; and in different kinds, any refemblance is generally remarked, without attending to the many particulars in which they differ.

A comparifon of the former neither tends to gratify our curiofity, nor to fet the objects compared in a ftronger light: two apartments in a palace, fimilar in Chape, fize, and furniture, make feparately as good a figure as when compared; and the fame obfervation is applicable to two fimilar compartments in a garden: on the other hand, oppofe a regular building to a fall of water, or a good picture to a towering hill, or even a little dog to a large horfe, and the contraft will produce no effert. But a refemblance betwcen objects of different kinds, and a difference between objeits of the fame kind, have remarkably an enlivening effect. The poets, fuch of them as have a juft tafte, draw all their fimiles from things that in the main differ widely from the principal fubject; and they never attempt a contraft, but where the things have a common genus, and a refemblance in the capital circumiltances: place together a large and a fmall-fized animal of the fame fpecies, the one will appear greater, the other lefs, than when viewed feparately: when we oppofe beauty to deformits, each makes a greater figure by the comparifon. We compare the drefs of different nations with curiolity, but without furprife; becaufe they have no fuch refemblance in the capital parts as to pleafe us by contrafing the finaller parts. But a new cut of a fleeve, or of a pocket, enchants by its novelty; and, in oppofition to the former fufhon, raifes fome degree of furprife.

That refemblance and difimilitude have an enliven-
2. fo:- i.g cfrat mpon wije?s of fiyht, is made fufficientiy 1. a e.
ifes ut the caber fences, is alfo certain. Nor is that laventind to the external fenfes; for eharaders con"t tce! make a greater tighre by !... oppoition: layn, in the trage ly is Othel.u, day,

That mathem: ugly.
The chataner of a i p, and of a rough waraior, ate novehere more fuccelstul! $y$ contratted than ia Shakepeate:

If finer. My liene, lad deny no priConers; Sut irmember, when the tight was done, When I was dey with rame, an I exireme toil, lotath!ctesed laint, lanaing "pon my fword, Came there a certata lor 3 , neat, trimily drefs's, Yrelh as at bridegrouns ; and his chin, new reap'd, Show'd like a tahbletand at hat velthome. He was pertumed like a milliner; And 'twint his finger and his thum't be held A pounce:-box, which cver and anos? Ife gave his nofe:-and till he fmil'd and talk'd ;
Ard as the foldiers bare dead bodies br, Ile calld them untaught knaves, unmannerly, To bring a flovenly, unhandforne corle Pewwint the wind and his nobility.
With many holiday and hady terms
Iie queftion d me: among the rell, domanded
My. pris'ners in your majelly's behalf.
I thin, all fimarting with my wounds; Leing gall'd
'To be to pellen'd with a popinjay,
Out ni ny griaf, and iny impatience, Anfered d, neglestingly, I know not what: He hoold, or thould not; for he made me mad, 'I'u lee lim thine fo brik, and fmell fo fweet, And fo taik like a waiting gentlewoman, Of guns, and diums, and wounds, (God fave the mark!) And relling me, the fovereign'ft thing on earth Was parmacity for an inward bruife; And that it was great piet, fo it was, This villanous falpetre fhould be digg'd Ost of the bowels of the harmlefs earth, Whach many a good, tall fe!low had deftroy'd so cowardly: : and but for thefe vile guns, He would himfelf have been a foldie:.Firylt fart, Henry IV. aet 1. fc. 4.
Pations and emotions are alfo enfamed by comparifon. A man of high rank humbles the byfanders even to annihilate them in their own opinion: Cafar, bcholding the Ratue of Alexander, was greatly mortified, that now, at the age of 32 , when Alexander died, he bad not performed one menorable adtion.

Our opisions alio are much influenced by compaifinn. A man whofe opulence exceeds the ordinary himendard is reputed richer than he is in reality; and widdom or weaknefs, if at all renarkable in an indisidual, is generally carried beyond the truh.

The opinion a man forms of his prefent d:frefs is heightened by contrafting it with his former happinefs:
---Con-Could I forget
What I have ocen, I might the better bear
What I'm deftin'd to. I'm not the firt

RES
That have been wrecthed : but to think hove mach I have been happecr.

Sa:uthern's Invasent Adultery, nis 2.
The diftefs of a long journey makes even an indif. ferent inn agreeable : and, in travelling, when the road is gond, and the horfenam well covered, a bad day miy be agrecable, by making him fentille how fary he is.
Tlic fome effeet is equally remarkable, when a man orpofes his condition to that of others. A thip toffed about in a ftorm, makes the fipectator reficet upon his own cafe and fecurity, and puts thefe in the frongof litht.

A inan in gricf cannot bear mirth; it gives him a more lively notion of his unhappinefs, and of courfe makes limm more unhapy. Sittan, contemplating the beanties of the terrelial paradite, lias the following exclamation :
With what delight could I have walk'd thee round,
If I could joy in aught, fweet intercha ge
Of hill and valley, rivers, woods, and plains,
Now hurd, now fea, and thures with forelt crown'd, Rocks, dens, and caves! but $l$ in none of thefe
Find place or refuge; and the more I fee
Pleafines about me, fo much more I feel
'Lorment within me, as from the hateful fiege
Of contraries : all good to me becomes
Bane, and in heav'n much worle would be my nate.
Paradife Lof, book 9. l. 114 .
The appearance of danger gives fometimes pleafure, fometimes pain. A timorous perion upon the battlements of a high tower, is feized with fear, which even the confcioufnefs of fecurity cannot didipate. But upon cne of a firm head, this fituation has a contrary cffeet : the appearance of danger he ghtens, by oppofition, the confcoumefs of fecurity, and confequently the fatisfaction that arifes from fecurity : here the feeling refembles that abovementioned, occafioned by a thip labouring in a form.

The effert of magnifying or leffening objeits by means of comparifin is to be attributed to the intluence of paffon over our opinions. This will evidently appear by reflecting in what manner a fpectator is affected, when a very large animal is for the firf time placed befide a *ery finall one of the fame fpecies. The firld thing that flrikes the mind is the difference between the two animals, which is fo great as to occafion furprife; and this, like other en:otions, magnifyng its objeat, makes us conceive the difference to be the greateft that can be: we fee, or feem to fee, the one animal extremcly little, and the other cxtrencly large. The emotion of furprife arifing from any unufual refembance, ferves equally to explain, why at firft view we are apt to think fuch refemblance more entire than it is in reality. And it mull be obierved, that the circumftances of more and lefs, which are the proper fubjects of eomparifon, raife a perception fo indiftinet and vague as to facilitate the effect defribed; we lave no mental ftandard of great and litte, nor of the foveral degrees of any attribute; and the mind, thus unrefliained, is naturally difpofed to indulge its furprife to the utmolt extent.
in exploring the operations of the mind, fome of which are extremely nice and nlippery, it is neceffary

## R E S

Refemblance.
in the man time is quite overlooked. To illurtrate this effer by a familiar example. Take a piece of paper or of linen tolerably white, and compare it with a pure white of the fame kind: the judgment we formed of the firt object is inftantly varied; and the furpsife occafioned by finding it lefs white than was thought, produced a hafty conviftion that it is much lefs white than it is in reality: withdrawing now the pure white, and putting in its place a deep black, the furprife occafioned by that new circuniftance carries us to the other extreme, and makes us conceive the object firft mentioned to be a pure white: and thus experience compels us to acknowledge, that our emotions !ave an influence even upon our eye-fight. This experiment leads to a general obfervation, that whatever is found more frange and beautiful than was expected, is judged to be more ftrange and beautiful than it is in reality. Hence a common artifice, to depreciate beforehand what we wifh to make a figure in the opinion of others.

The comparifons employed by poets and orators are of the kind laft mentioned; for it is always a known object that is to be magnified or leffened. The former is effected by likening it to fome grand objeet, or by contralting it with one of an oppofite character. 'To effecuate the latter, the method mult be reverfed: the object mult be contrafted with fomething fuperior to it, or likened to fomething inferior. The whole effect is produced upon the principal objeat which by that means is elevated above its rank, or depreffed below it.

In accounting for the effect that any unufual refemblance or diffimilitude hath upon the mind, no caufe has been mentioned but furprife; and to prevent confution, it was proper to difcufs that caule firf. Dut furprife is not the only caufe of the effect defcribed: another nccurs, which operates perhaps not lefs powerfully, viz. a principle in human nature that lies ftill in obfcurity, not having been unfolded by any writer, though its effects are extenfive : and as it is not diftinguifhed by a proper name, the reader mult be fatisfied with the following defcription. Every man who ftudies himfelf or others, mult be fenfible of a tendency or propen!.ty in the mind to complete every work that is begun, and to carry things to their full perfection. There is little opportunity to difplay that propenfity upon natural operations, which are feldom left imperfeat; but in the operations of art it hath great fcope: it impels us to perievere in our own work, and to wifh for the completion of what another is doing : we feel a fenfible pleafure when the work is brought to perfection; and our pain is not lefs fenfible when we are difappointed. Hence our uneafiness when an interefting fory is broken off in the middle, when a piece of mufic ends without a clofe, or when a building or garden is left unfinifled. The fame propenfity operates in making colleations; fuch as the whole works, gnod and bad, of any author. A certain perton attempted to colleat prints of all the capital paiutings, and fucceeded except as to.a tew. La Bruyere remarks, that an anxious fearch was made for thefe; not for their vaiue, but to complete the fet.

The final caufe of the propenity is an additional proof of its exiftence. Human works are of no fignificancy till they be completed; and re.tion is not always a fuficient counterbalance to indolence : fome pria-

Refon:-
blance.

Reremblance.
ciple over and above is noceflary to excite our indultry, and to prevent our ftopping thort in the middle of the comite.

IVe need not lofe time to deferibe the co-operation of the foreguing propentity with furprite, in producing the calien that fullows any unufual refemblance or diflimilitule. Surprile firlt operates, and carries our opinivn of the refemblance or diflimilitade beyond truth. The propenfity we have been defribing carries us ftill farther; for it forces upon the mind a conviction, that the relemblance or diflimilitude is complete. We need no better illurkation, than the refemblance that is fandicd in forme pebbles to a tree or an infect; which refenhlance, howcer faint in reality, is conceived to be wonderfully pertef. The tendency to complete a rei. ablance afing joimtly with furprife, carries the mind dimetimes io far, as even to prefune upon futureevents. In the Greek tragedty entitled Phincides, thofe unlappy wumen fecing the place where it was intended they Arill Poce. thould be 1lair, cried out with anguifh, "They now сан 1\%. faw their cruel defting had condemned them to die in that place, being the fame where they had been expofed in their infancy."

The propenfity to advance every thing to its perfection, not only co-operates with furprile to deceive the mind, but of itfelf is able to produce that effect. Of this we fee many infances where there is no place for furprife; and the firf we thall give is of refemblance. Unanquodque coi'enn modo diffolvitur quo collisatum eft, is a maxim in the Roman law that has no fommation in truth; for tying and loofing, building and demolifhing, are acts oppolite to each other, and are performed by oppofite means: but when thefe acts are conne?ted by their relation to the fame fubject, their connection leads us to imagine a fort of refemblance between them, which by the foregoing propenfity is conceived to be as complete as poflible. The next inftance fhall be of contratt. Addifon obferves, "That the paleft features look the moft agrecable in white ; that a face which is overflufhed appears to advantage in the deepeit fc:rlet ; and that a dark complexion is not a little alieviated by a black hood." The foregoing propenfity ferves to account for thefe appearances; to make this evident, one of the cafes thall fuffice. A complexion, however dark, never approaches to black: when thefe colours appear together, their oppolition ftrikes us; and the propenfity ve have to complete the oppolition, makes the darknefs of complexion vanifh out of light.

The operation of this prapenfity, even where there is maground for furprife, is not confuned to opinion or convition: (u) powerful it is, as to make us fometimes proced to agion, in order to complete a refemblance or diffimilitule. If this appear obfcure, it will be made claar by the following int:ance. Upon what priaciple is the lex tat ais founded, other than to make the punilhment refemble the mifhief? Reafon dictatec, that there onght to he a conformity or refemblance between a crime and its punifhment; and the fregoing propenfity impels us to make the refemblance as complete as poffible. Titus Livius $\|$, under the influence of that propenfity, accounts for a certain

Mcttus Fuffetins, the Alban general, who, for treachery to the Romans his allies, was fentenced to be torn to pieces by horfes, he puts the following feeech in the mouth of Tullus Holtilius, who decreed the funifhment "Mretre Fuffet, inquit, fi ipfe difere pofies fidem ac fxdera fersare, vivo tibi ea difciplina a me adhubian efit. $\lambda^{*}$ :unc, quonium tuum infonabile ingernium cfp, at fu tuo fupplicio doce liumumum genus ea fanda credere, que a te violuta funt. Ult igitur foblo ante animum inter liodenatem Romanamque rem anciniteng giffil, ita jom corpus pa/Im difRrabendun dabis" By" the lame influence, the fentence is often executed upon the very lpot where the crime was committed. In the Eleara of Sopl:ocles, Egitheus is draggel from the theatre into an inner room of the fuppofed palace, to fuffer death where he murdered Agamemmon. Shakefpeare, whofe knowledge of nature is not leds profound than extenfive, bas not overlooked this propenfits.
"Obsello. Get me fome poifon, Iago, this night. I'll rot expoftulate with her, laft hes body and her beanty unprovide my mind again. "This night, Itgn."
"Iago. Do it not with poiion; ftrangle her in her bed, even in the bed fie hath contaminated."
"Otbillo. Good, grood: the jultice of it pleafes: very good."

Othelio, all 4 .ji. 5.
Perfons in their laft momentsare gencrally feized with an anxiety to be buried with their relations. In the Amynar of Taffo, the lover, hearing that his miftrefs was torn to pieces by a wolf, exprelles a defire to dic the fame death.

Upon the fubject in general we have two rematis to add. The firf concerns refemblance, which, when too entise, hath no effect, however different in kind the things compared may be. The remark is applicable to works of art only; for natural objects of different kinds have fcarce ever an entire refemblance. To give an example in a work of art : Marble is a fort of matter very different from what compofes an animal; and marble cut into a human figuse, produces great pleafure by the refemblance : but if a marble ftatue be coloured like a picture, the refemblance is fo entire as at a diftance to make the fatue appear a real perfon: we difcover the miftake when we approach; and no cther emotion is raifed, but furprife occafioned by the deception: the figure Atill appears a real perfon, aather than an imitation; and we muft ufe refection to correct the miftak. This cannot happen in a picture ; for the refemblance can never be fo entire as to difouife the imitation.

The other remark belongs to contraft. Emotions make the greatef figure when contrafed in fucceflion ; but then the fucceflion onght neither to be rapid, nor immoderately flow: if too dlow, the effect of contraft becomes faint by the diftance of the emotions: and if rapid, no fingle emotion has roon to expand itfelf to its full fige, but is ftifled, is it were, in the birth by a fucceeding emotion. The funcral oration of the bifhop of Meaux upon the duchet's of Orleans, is a perfeat hodge-podge of cheerful and melancholy 1 eprefentations, following each other in the quickelt fucceflion: oppofite emotions are beff felt in fuccefion; but each emotion feparately thonld be railed to its duz pitch, before another be introduced. punifliment by a refemblance between it and the crime, too fub:ilc for comrion apprchenfion. Speaking of

## R E S

Refemlibance.

What is above laid down, will enable us to deter. mine a very important queltion concerning emotions raifed by the tine arts, viz. Whether ought fimilar cinotions to fucceed each other, or diffimilar? The emotions raifed by the fine arts are for the molt part too nearly related to make a figure by refemblance; and for that reaton their fucceffion ought to be regulated as much as polfible by contralt. 'This hood; confelfedly in epic and dramatic compofitions; and the belt writers, led perhaps by tafte more than by rea. foning, have generally aimed at that beauty. It holds equally in mutic : in the fame cantata all the variety of emotions that are within the power of mulic, may not only be indulged, but, to make the greatef figure, oight to be contralted. In gardening, there is an additional reafon for the rule: the enotions raifed by thac art, are at beft fo faint, that every artifice fhonld be emplojed to give them their utmoft vigour: a field may be laid out in grand, fweet, gay, neat, wild, melancholy fenes; and when thefe are viewed in fucceffion, grandeur onght to be contrafted with neatncfs, regularity with wildnefs, and gaiety with melancholy, fo :is that eacla emotion may fucceed its oppofite : nay, it is an improvement to intermix in the fucceffion rude uncultivated fpots as well as unbounded views, which in themfelves are difagreeable, but in fuccellion heighten the fecling of the agreeable object ; and we have nature for our guide, which in her moft beautiful landfapes often intermixes rugged roeks, dirty marihes, and barren ilony heaths. The greatelt mafters of mufic lave the fame view in their compolitions: the fecond part of an Italian fong feldom conveys any fentiment: and, by its harfhrefs, feems purpulely contrived to give a grcater relifh for the interefting parts of the compofition.

A fmall garden, comprehended under a fingle view, aftords little opportunity for that embellihment. Diffimilar emotions require different tones of mind; and therefore in conjunction can never be pleafant: gaiety and fwectnefs may be combined, or widnefs and gloominefs ; but a compofition of gaiety and glocminefs is diftafteful. The rude uncultivated compatment of furze and broom in Richmond garden, hath a good effect in the fucceffion of objects; but a fpot of that nature would be inlufferable in the midtt of a polifhed parterre or flower-pot. A garden, therefore, if nut of great extent, admits not diflimilar emotions; and in omamenting a fmall garden, the fafent courfe is to confine it to a fingle expreflion. For the fame reafon, a landfcape ought alio to be cunfined to a fingle expreflion; and accordingly it is a zule in painting, that if the fubject be gay, every figure ought to contribute to that emotion.

It follows from the foregoing train of reafoning, that a garden near a great city ought to have an air of folitude. The folitarincfs, again, of a wafte country ought to be contrafted in forming a garden; no temples, no obfcure walks; but jets d'eau, cafcades, objects active, gray, and fplendid. Nay, fuch a garden fould in fome meafure avoid imitating nature, by taking on an extraordinary apperrance of regularity and art, to thow the bufy liand of man, which in a wafte country lias a fine efleet by contralt.

Wit and ridicule make not an agreeable mixture
with grandeur. Dilimilar emotions hare a filue çicat in al flow fuccofion; but in a rapid fuccellion, whicl approaches to co-eviftence, they will not be relithed. In the midt of a laboured and elevitted defoription of battle, Virgil introduces a ludicrous image, which is celtainly out of its place:

Obvius ambuftum torrem Chorinæus ab ara Curripit, et venienti Ebufo plaganque ferenti Occupat os fammis: illi ingens barba reluxit, Nidoremque ambufta dedit. Sil. xii. 2 ys. E qual tauro ferito, il fuo dolore
Verio mugghiando e infpirando fuore. Gierufal. cant. 4. At. I.
It would howerer be too auftere to banifh altogether ludicrous images from an cpic poem. This pocnu doth not always foar above the clouds: it admits greai variety; and upon occafion can defcend even to the ground without finking. In its more f.mmliar tones, a ludicrous fcene may be introduced without improp-icty. This is done by Virgil * in a foot-race: the cir- : Eneid, cumfances of which, not excepting the ludicrou; part, lih. v. are copied from Homer $\dagger$. After a fit of meriment, $\dagger$ lliad, we are, it is tine, the let's difpofed to the ferious and xxiii. 879. fublime: but then, a ludicrous feene, by unbending the mind from fevere application to more interefing fubjects, may prevent fatigue, and preferve our relitis entire.

RESEN, (Mores) ; a town on the Tigris, buitt by Nimrod; thought to be the Larifls of Xenophon; which fec. But as Larifa is a name in imitation of a Greek city; and as there were no Greek cities, confequently no Larifa in Afyria, before Alexander the Great ; it is probable that the Greeks afking of what city thofe were the ruins they faw, the Affrrians might antwer, Larefen, "Of Refen;" which word Xenoploon expreffed by Larifa, a more familiar found to a Greek ear, (Wells).

RESENTMENT, means a ftrong perception of good or ill, generally a deep fenfe of injury, and may be ditinguifhed into anger and revenge. "By anger (fays Arcladeacon Paley), I mean the pain we fuffer upon the receipt of an injury or affront, with the ufual effect of that pain upon ourfelves. By revenge, the infl.cin's of pain upon the ferfon who has injured or offended us, farther than the juft ends of punilhment or repar. tion require. Anger prompts to revenge ; but it is poffible to fufpend the effect when we cannot altogether quell the principle. We are bound alfo to endeavour to qualify and correct the principle itfeif. So that our duty requires two different applications of the mind : and for that reafon anger and revenge fhould be confidered feparately:" See Revenge.

RESERVATION, in law, an action or claufe whereby fomething is referved, or $f=$ cured to one's felf.

Mental Reservation, a propolition which, fililly taken, and according to the natural import of the terms, is falfe; but, if qualified by fomething concealed in the mind, becomes true.

Mental refervations are the great refuge of religious hypocrites, who ufe them to accomnodate tlacir confciences with their interefts: the Jefuits are zealous ad. vocates for mental refervations; yet are they real lies, as including an intention to deceive.

## R E S

RESERVE, in law, the fame with refervation. Sce Rejervation.
Bu!! of Refrave, or Corps de Resfrfe, ill military affairs, the third or lall line of an army, drawn up for batele; fo called beeanfe they are referved to fullain the telk as occalion requires, and not to engage but in cafe of mecetity:

RESERVOIK, a place where water is collefed and reerved, in order to be convesed to dittant places throngh pipes, or fupply a fount.in or jet d'eau.

RLSEET, in law, the receiving or habouring an outlawed perion. See Outlawry.

Resfer of Thef, in Scots law. Sce Iaw, $n^{\circ}$ clexxvi. 29.

RESIDENCE, in the e:mon or common law, the abole of a pertion or incumbent upon his benefice; and luis alliduity in attending on the fame.

RESIDEN 1 , a public minitter, who manages the affairs of a kinglom or ftate, at a foreign court.

They are a clafs of public minifters infentor to ambalfadors or envojs; but, like them, are under the prutection of the law of nutions.

RESIDUE, the remainder or balance of an account, delet, or obligation.

RESIGNATION, in general, fignifies the implicit fubmition of ourfelves, or of fomething we poliefs, to the will of another. In a religious ferfe it fignifies a perfect fubmifion, withont difcontent, to the will of God. Sce Moral Philosophy, $1^{\circ}$ 1:9.

RESIN, in natural hiRory, a vifcid juice oozing either fpontmeount, or by iscifion, from feveral trees, as the pine, fir, \&ec.-A premium for feveral years has been of fered by the London Society for Encouraging Arts, \&c. for ditcovering a mode of reducing the inflammable quality of refin, fo as to adapt it to the purpofes of making car.dles; but no fiuch difeovery has yet been made.

Elafic Resin. See Canutchouc.
Gum Resin, a mixture of gum and refin. See Pharmacy, $\mathrm{n}^{\mathrm{c}} 3^{8 .}$.

Red Guan Resin, is procured from the red gum tree, or eucalyptus refinifera; a tree fo large and lofty as to excced in fize the Englifh oak. The wood of the tree is brittle, and of little ufe but fir firewood, from the large quantity of refinous gum it contains. The tree is ditinguifhed by having pedunculated flowers, and an act:te or pointed conical calyptra. To obtain the juice ircm this tree incificons are made in the trunk of it, and fometimes upwards of 60 gallons of red refinous
juice have been obtained from one of them. "When this juice is dried, it becomes a very p werful aftringent gum-ichin, of a red colour, muh refembling that known in the thops by the name of kino, and, for all medical purpofes, fully as efficacinus. Mr White admin:flered it to a great number of patients in the dyfentery, which prevailod much, fonn atter the landing of the convists, and in no one infance found it to friil. This gum-retin diflolves almoft entirely in fpirit of wine, to which it gives a blood-red timbure. W'ater diffoives about one fixth part only, and the watery folutien is of ab bright red. Both thefe folutions are powerfilly aftringent.

Tellore Gum Resin, is procured from the yellow refin tree, which is as large as the Englifh watnut tree. the propertics of this refin are equal to thofe of the
moft fragrant balfams. It exudes from the bark fpon- Refineva, taneoully, but more readily if incifions are made. The $\underbrace{\text { Refiftance. }}$ colour of it is yellow, and at firt it is Huid; but after being infpiffated in the fun, it becomes folid. When burnt on hot coals, it fmells like a mixture of balfam of Tolu and benzoin, approaching fomewhat to forax. "lt is perfeclly foluble in fipirit of wine, but not in wa- thid. ter, nor even in elfential oil of turpentine, unlefs it be digefled in a flrong heat. The varnifh which it makes with either is very weak, and of little ufe. With refpeat to its medicinal qualities, Mr White has found it, in many cales, a good pectoral medicine, and very balfamic. It is nut obtainable in fo great abundance as the red gum produced by the eucalyptus refinifera. The plant which produces the yellow gum feems to be periéctly unknown to botanifts, but Mr White has communicated no specimens by which its genus or even clafs could be determined."

RESiNOUS electricity, is that kind of electricity which is produced by exciting bodies of the retinous kind, and which is generally negative. See Electricity pafim.
resistance, or Resisting Force, in philofophy, denotes, in general, any power which acts in an oppofite direatinn to another, fo as to deftroy or dimmaht its eifect. See Mechanics, Hydrostatics, and Pineumatics.

Of all the refiftances of bodies to eazh, there is un- Importance dubtedly none of greater importance than the re of the fubfillance or reaction of fluids. It is here that we jee.. mult look for a theory of naval architecture, for the impulfe of the air is our moving power, and this mult be modified fo as to produce every motion we want by the form and difpofition of our fails ; and it is the refiftance of the water which mult be overcome, that the fhip may proceed in her courfe; and this muft alfo be modified to our purpofe, that the fhip may not drive like a log to leeward, but on the contrary may ply to windward, that the may anfiver her helm brikly, and that the may be eafy in all her motions on the furface of the troubled ocean. The impulfe of wind and water makes them ready and indefatigable fervants in a thoufand flapes for driving our machines; and we foould lofe much of th ir fervice did we remain ignorant of the laws of their action: they would fometimes become terrible malters, if we did not fall upon methods of eluding or foftening their attacks.

We cannot refufe the ancients a confiderable know- The anciledge of this fubject. It was equally interefting to them ents were as to us; and we cannot read the accounts of the naval exertions of Phonicia, Carthage, and of Rome, exertions which have not been furpalid by any thing of modern date, without believing that they pulferfed much practical and experimental knowledge of this fubject It was not, pethaps, polfelled by them in a Atrat and fy frematic form, as it is now taugh by our mathematicians; but the mafter-builders, in their dockyards, did undoubtedly exercife their genius in comparing the forms of their finelt hips, and in marking thofe circumfances of furm and dimenfion which were in fad accompanied with the defirable properties of a hip, and thus framing to themfelves maxims of naval architefture in the fame manner as wa do now. For we belicve
$\underbrace{\text { Refiftance. believe that our naval architects are no: difpofed to }}$
$\underbrace{\text { Refiftance. believe that our naval architects are no: difpofed to }}$ grant that they have profited much by all the labours of the mathematicians. But the ancients had not made any great progrefs in the phyficomathematical fciences, which confilt chiefly in the application of calculus to the phenomenci of nature. In this branch they could make none, becaufe they had not the means of inveltigation. A knowledge of the motions and actions of Huids is acceffible only to thofe who are familiarly

3
But even How it is nut perfectly urderftood.

Sir T. New-
Sir r. New- Sir Ifach Newton was the firft (as far as we can reponied mas themarics to it.

## be mee

with in it. acquainted with the flusionary mathematics; and without this key there is no admittance. Even when poffeffed of this guide, our progrefs has been very now, hefitating, and devious; and we have not yet been able to eftablith any fet of doarines which are fufceptible of an eafy and confident application to the arts of life. If we have advanced firther than the ancien:s, it is becaufe we have come affer them, and have profited by their labours, and even by their mittakes. colleft) who attenpted to make the motions and actions of fluids the fubject of mathenatical difculfion. He had invested the method of fuxions long before he encaged in his phyfical refearches; and he procesded in thefe fuat mathefis fucen praferentc. Yet even with this guide he was often obliged to grope his way, and to try various bye-palh:, in the hopes of obtaining a legitimate theory. Having exerted all his powers in eftablifthing a theery of the lunar motions, he was obliged to reft contented with an approximation inflead of a perfeet folution of the problem which afeertains the motions of three bodies mutually acting on each other. This couvinced him that it was i: 1 vain to expect an accurate invertigation of the motins and actions of fluide, where millions of unfer particies combine their inflaence. He th-refore cull about to find fome particuiar cafe of the problem which would admit of an accurate determindtion, and at the rame time furnifh circumflances of analozy or refemblance fufficiently numerous for giving limiting cafes, which fhould include between them thofe other cafes that did not actmit of this accurate inveltigation. And thus, by knowing the limit to which the cafe propofed did approximate, and the circumflances which regulated the approximation, many uffful propoficions might be deduced for directing us in the application of thefe doctrines to the arts of life.

He therefore figured to himfelf a hypothetical collection of matter which poffeffed the clarateriftic property of fluidity, viz. the quâqu.tacer/um propagation of prelfure, and the moft perfeat intermobility (pardon the uncouth term) of paris, and which fornied a phyfical whole or aggregate, whise parts were connected by mechanical forces, determined both in degree and in direftion, and fuch as rendered the determination of certain important circumftances of their m tion fufeeptible of precife inveltigation. And he concluded, that the laws which he fhould difcover in thefe motions muft have a great analogy with the laws of the motions of real fluids: And from this hypothefis he deduced a fo. ries of propofitions, which form the batis of almoft all
7 the theories of the impulie and refiftance of fiuids which

## Which

## does not,

 however, agree with experiment.mathematicians, it proceeds on principles or affumptions whichare not only gratuitous, but even falfe. But it affords fuch a beautiful application of geometry and calculus, that mathematicians have been as it were fafo cinated by it, and have publifhed fyitems fo elegant and to extenfively applicable, that one camot help lamenting that the foundation is fo fimfy. John Bernoulli's theory, in his differtation on the communication of motion, and Douguer's in his Traité du Navire, and in his Theorie du Mancuve e et de la Mature des Vaiffcouk, mult ever be cenfidered as among the fineft fpecimens of phyficomathematical fcience which the world has feen. And, with all its imperfestions, this theory 8 fill furnifhes (as was expected by its illuftrious author) lity is fill many propofitions of immenfe practical ufe, they be- rery confiing the limits to which the real phenomena of the im- derable. pulle and refiftance of fluids really approximate. So that when the law by which the phenomena deviate from the theory is once determined by a well chofen feries of experiments, this hypothetical theory becomes almolt as valuable as a true one. And we may add, that although Mr d'Alembert, by treading warily in the Reps of Sir Sfaac Newton in another route, has difcovered a genuine and mexceptionable theory, the procefs of inveftigation is fo intricate, requiring every finefle of the moft abfrule analyfis, and the final equations are fo complicated, that even their moft expert antior has no: been able to deduce more than one fimple propofition (which too was difcuvered by Daniel Bernoulli by a more fimple procefs). which can be applied to any ufe. The hypothctical theory of Newion, thereflire, contioues to be the groundwork of all. our practical knowledge of the fubjeat.

We fhal) therefore lay before our readers a very flort view o' the theary, and the manner of applying it. We thill then flow its dufets (all of which were pointed out by its great author), and give an $h$ frorical account of the many attempes which have been made to amend it or to finftitute another: in all which we think ic our duty to fhow, tha: Sir Ifac Newton look the lead, and printed out every path which whers have taken, if we except Daniel Bernoulli and a'Alembert; and we thall give an accomut of the chiet fets of experimer:ts which have bcen made on this important fubjeet, in the hopes of eftablifhing an empirical thenry, which may be employed with confidence in the arts of life.

We know by experience that furce nuft be applied to a body in order that it may move through a fluid, fuch as air or water; and that a body projected with any ve'ocity is gradually retarded in its motion, and generally brousht to relt. The analogy of nature makes us imagine that there is a force acting in the oppofite direction, or oppofing the motion, and that this force refides in, or is exerted by, the fluid. And the phonomena refemble thofe which accompany the known refiflance of adive bcings, fiuch as animals. Thercfore we give to this fuppofed force the retaphorical n:me of Resistance. We alio hnow that a fluid in motion will hurry a folid body alnng with the ftream, and that it requires force to naintain it in its place. A fimilar analogy makes us fuppofe that the fluid exerts foree, in the fame manner as vihen an adive being impels the body beforc him; therefore we call this the Inpuision of a Fluid. And as our knowledge of natureinforms us that the mutund adions of bodies are in:
every:

## R ES [ 24$]$ E ES

 If nlan ene, of the chan, ing fore, the forces are the time. : bler vecill l:m imputions or relifance:) vic il e theive mr:io: are the hime, and theref: re d-pend enfuly on thefereative in tions. The force,
 m. asubie a tream of water, thowing with a certain whecte, is the hame with what is :equired for nowing hha bndy with thi, alocity through Ragnant water. T's any one wh atmits the $\dot{m}$ tion of the carth round the fiun, is is evilent that we can meither offerve nor re ten from a cate of a bidy moving through fill wate:, nor of a lleam of water prening upon or impelling it cyuicfeent bedy.

A body in mution appears to be refinted liy a Aay. r.a"t fund, becauie it is a law of mechanical noture that tarce mulk be employed in order to put ar:j body in m "inn. Now the body cannot move forward withont futting the contiguous flaid in motion, and force mult be eneployed f:r producieg this motion. In like mans:e, a quifiecot body is impelled by a flram of flud, becaute the motion of the contiguous Huid is diminilhed by this folid obftacle; thic retift ance, therefore, or im:julie, no way differs from the ordinary communications of motion among folid bodies.

Sir laac Newton, therefore, begins his theory of the retillance and impulfe of fluids, by felesting a cafe where, althongh he cannot pretend to afeatain the motions themelves which are produced in the particles of a contiguous fluid, he can tell precifely their mutual ratios.
will have the fame ratio whe the diflances of the partic.cs. The curnes defcribed by the correlponding bodies will therefore be fimilas, the velocities will be proportional, and the bodies will be fimilarly fituated at the end of the firt moment, ard exprfed to the atetion of fimilir and limilaly fituated centripetal or centrifugal forces; and this will :gain produce fimilar rintions during the next moment, and to on for ever. All this i, evidut to any pertion acquinted widh the elementary doctrines of curvilineal motions, as delivered in the thenry of rhylical aftronon: $y$.

From this fuidamental propefition, it clearly follows, that if two dimilar bodies, having their hemologras lines proportional to thofe of the two fyttens, be limil.arly projected ano:ng the bodies of t'o ofe two fy ftems will atmy velocities, they will poduce fimilar motions in the two fyllems, and will themfelves continue to move limilarly ; andthereforw will, in cerery fubfequent moment, fulfer finilar diminutions or retardatorns. If the initial velocitics of piojection be the fome, but the denfities of the two fylteme, that is, the quantities of matter conthined in an equal bulk or extent, be different, it is evident that the quantities of motion produced in the two fyftems in the fume time will be proportional to the denfities; and if the donfities are the fame, and uniform in each fy ftem, the quantities of motion produccd will be as the fquares of the velocities, becaufe the motion communicated to each correfponding body will be proportional to the velocity commenicated, that is, to the relocity of the impelling body; and the number of fimilarly fituated particles which will be agitated with alfo be proportional to this velocity. Therefure, the whole quantities of motion produced in the fame moment of time will be propotional to the fyurres of the velocities. And lafty, if the denfities of the two fyftems are uniform, or the fame through the whole extent of the fyltems, the number of pirticles impelled by fimilar bodies will be as the furfaces of thefe bodies.

Now the diminutions of the motions of the projected bodies are (by Newton's third law of motion) equal to the motions produced in the fyltems; and thefe diminutions are the meafurcs of what are called the refiftances oppofed to the motions of the projected bodies. Thereforc, combining all thefe circumifances, the refiftances are proportional to the fimilar furfaces of the moving bodies, to the denfities of the fyllems through which the motions are performed, and to the fquares of the velocities, jointly.

We cannot form to ourf lives any diftinat notion of a flud a flud, otherwife than as a fyfem ufimall budies, or a confidered collection of parti. les, finilarly or fymmetically arran- as a fy fem ged, the centres of each being fittated in the angles of regular folids. We muft form this notion of it, whether we fuppofe, with the vulgrar, that the particles are milaty are little globules in metual contad, or, with the partifans of corpufcular attractions and repulfions, we fuppofe the particles kept at al diftance from each other by means of thefe attraations and repulfons mutuatly balancing each other. In this latt cafe, no other anrangement is confiftent with a quiefeent equilibrium: and in this cafe, it is evident, from the theory of curvilineal motions, that the agitations of the particles will always be fuch, that the connecting forces, in actual exertion,

He fuppofes two fytems of bodies fuch, that each bodry of the frit is fimilar to a corrfponding body of the fecond, and that each is to each in a conitant ratio. He alfo fuppofes them to be fimilarly fituated, that is, at the angles of fimilar figures, and that the homologous lines of thefe figures are in the fame ratio with the diameters of the bodies. He farther fuppofes, that they attract or repel each other in fimilar direftions, and that the aecelerating connecting forces are alfo proportional; that is, the forces in the one fyftem are to the corre ponding fores in the other fyttem in a conftant ratio, and that, in each fyftem taken apart, the forces are as the fquares of the velocities direetly, and as the diameters of the correfponding bodies, or their diftances, inverfly:

This being the cafe, it legitimately follows, that if

Ifica of the fismilar farts being put in 120tion. tions, in any given inflant, they will continue to move fimilisly, cach correfpondent body defcribing fimilar curves, with proportional velocities: For the bodies being fimilarly fituated, the forces which act on a body in one fyttem, arifing from the combination of any number of adjoining particles, will have the fame direction with the force asting on the correfponding body in the other fyftem, anifing from the combined aftion of the fimilar and fimilarly dirceted forces of the joining correfiondent bodies of the other $f_{3} \mathrm{Rem}$; and thefe compound forces will have the fane ratio with the fimple forces which conftitute them, and will be as the fquares of the rel citics dircetly, and as the difances, or any homologous lines inverfly; and therefore the chids of curvature, having the direction of the centripetal or centrifugal forces, and fimilarly inclined to the tangents

Refinance. $\underbrace{\sim}$ will be proportional to the fquares of the velocities directly, and to the chords of curvature having the directiun of the forces inverfely.

From thefe premifes, therefore, we deduce, in the fricteft manner, the demoultration of the leading theorem of the refiftance and impulfe of fluids; namely,
${ }^{34}$ law of Prop. I. The refiltances, and (by the third law of moFird law of the refife ance, \&e. of fluids. tion), the impultions of Huids on fimilar bodies, are proportional to the furfaces of the folid bodies, to the dentities of the fluids, and to the fquares of the velocities, jointly.
We muft now obferve, that when we fuppofe the par. ticles of the Huid to be in mutual contadt, we may either fuppofe them elaftic or unelaftic. The motion communicated to the collcation of elaftic particles muft be double of what the fame body, moving in the fame manner, would communicate to the particles of an unclattic fluid. 'Lhe impulic and relillance of elaftic fluids muft therefore be double of thofe of unelaftic fluids.But we mult caution sur readers not to judge of the elafticity of fuids by their fenfible comprefibility. A diamond is incomparably more elaftic than the finell foot- ball, thougt not compreffible in any fenflble degrec.It rcmains to be oecided, by well chofen experiments, whether witer be not as claftic as air. If we fuppofe, with Boforich, the partic!es of perfect fluids to be at il ditance frem each other, we thall find it difficult to conc-ive a flutd roid of elafticiey. We hope that the theory of their inpulie ard refitance will fuggelt experiments which will decide this queltion, by pointing out what ought to be the abiolute impuife or refillance in eith $\because$ cafe. And thus the fundamental propofition of the impulee and refifance of fluids, taken in its proper meaning, is tufceptible of a rigid demontration, relative to the only diftine notion that we can from of the internal conftitution of a fluid. We fay, taien it ts procer mean no ; namaly, that the impulie or refitance of tuids is a preffure, appofed and mealured by an ther preffure, fucs as in pound weight, the force of a fromg, the prefure of the atmefplere, and the like. And we apprehons that it would be very difficult to find any legitinate demontration of this leading propofition different frum this, which we have now borrowed from Sir Ilaic N゙ewton, Prop. 23. B. II. Princip. We acknowledge that it is prolix and cven circuitous: but in all the attempts made by his commentators and their copyits to limplify it, we fee great defects of logical arpument, or altumption of principles, which are not only gratuitous, but inadmiffible. We thall have occafion, as we procced, to point out fome of thefe derects; and doubt not but the illuftrious author of his demonItration had exercifedhisuncommon patienceandlagacity ir. fimilar attempts, and was diffatisfied with them all.

Before we procecd further, it will be proper to make a feneral remark, which will fave a great deal of difcuffion. Since it is a matter of univerfal eaperience, that every acticn of a body on others is accompanied by an equal and comtrary reaction; and fince all that we can demontlrate concerning the refiftarce of bodies during their motions through iluids proceeds on this fup. polition, (the refitance of the body being affuncd as equal and oppolite to the fum of motions comnunicated te the particles of the fluid, eftimated in the chirection of the body's motion), we are intitled to proced in the
contrary order, and to confider the impulfions which leffinarce. each of the particles of fluid exerts on the body at reft, as cqual and oppofite to the motion which the body would communicate to that particle if the faid were at reft, and the body were moving equally fwitt in the oppolite direction. And therefore the whole impulfion of the fluid muit be conccived as the meafure of the whole motion which the body would thus communicate to the fuid. It mult therefore be alfo confidered as the meafure of the refiftance which the body, moving with the fame velocity, would fuftain from the fluid. When, therefore, we ihall demonftrate any thing concerning the impulfion of a fluid, eilimated in the direction of its motion, we muft confider it as demontrated concerning the reffetance of a quiefcent Huid to the motion of that body, havirg the fime velocity in the oppofite direction. The detcrmination of thefe impulfions being much eafier than the determination of the motions communicated by the body to the particles of the fluid, this method will be followed in moft of the fubfequent difcuffions.

The general propofition already delivered is by no means fufficient for explaining the various important phenomena obferved in the mutual actions of folids and fluids. In particular, it gives us no alfitance in afcertaining the moditications of this refiftance or impulfe, which depend on the thape of the body and the inclination of its impelled or refffed furface to the direfion of the motion. Sir Iface Newton found another hypothefis necelfary ; namely, that the fluid fhould be fo extremely rare that the diftance of the particles may be incomparably greater than their diameters. This additional condition is neceffary for confidering their actions as fo many feparate collifions or impulfions on the folid body. Each purtic!e mof be fuppofed to have abundant room to rebound, or otherwife efcape, after having made its Aroke, without fenlibly affentuig the diturtions and motions of the particles which have not yet made their froke: and the motion mult be fo fwiti as not to give time for the fenfible exertion of their mutual forces of attractions and repulfions.

Keeping thefe conditions in mind, we may proceed to determine the impulfions made by a fuid on furfaces of every kind: And the moft convenient method to purfue in this determination, is to compare them all either with the impulie which the fame firface would receive from the fluid impinging on it perpendicularly, or with the impulfe which the fame flrean of fluid would make when coming perpendicularly on a furtace of fuch extent as to occupy the whole ftream.

It will greatly ahbreviate languige, if we make ufe Termser of a few terms in an appropriated fenie.
plained.
By a flıeam, we fabll man a quantity of fluid moring in nne direction, that is, cach particle moving in paral. Jel lines; and the lireadts of the flream is a line perpen. dicular to all thefe parallels.

A filament means a portion of this fream of very fmall breadth, and it confifts of an indefinite number of particles following one another in the fame direction, and fuccefively impinging on, or gliling along, the furface of the folid body.

The bafe of any furface expofud to a fream of flaid, is that portion of a plane perpendicular to the Aream, which is covered or protected from the ataion of the flream by the furface cxpoled to its impulfe. Thus the bafe of a folere expofed to a fream of fluid is its great circle,

## RES

Befrane. circh, whofephate is perpendizuiar to the fream. If

IBC (fig. t.) be a plane furface expofed to the agion of a lieam of huid, moving in the dircation DC, then $B R$, or $S E$, perp ndicuar to $D C$, s its bate.

Direct infat'f liall exprefs the energy or atation of the parsicle or tilament, or fream of fluid, wele mecting the firface perpendicularly, or when the firtace is perpendicular to the direction of the ftream.

Ab clute impalfe means the actual preflure on the impelled furface, arifing from the action of the Huid, whether ltriking the furface perpendiculariy or obliquety; or it is the foree in prefled on the furtace, or tendency to motion which it acgures, and which nuft be oppofed by an equal force in the oppofite direction, in order that the furface may be mamained in its place It is of impertance to hecp in mind, that this prellure is always perpendieular to the furface. It is a propofition tounded on univerfal and uncontradicted experience, that the mutual astions of bodies on each other are always exerted in a dirention perpendicular to the touching furfaces. Thus, it is oblerved, that when a billiard ball A is Itruck by another I , moving in any direction whatever, the ball A always motes off in the direction perpendicular to the plane which touches the two balls in the point of mutual contad, or point of impulie. This induative propofition is fupported by every argument which can be drawn from what we know concerning the forces which conned the particles of mater together, and are the immediate caufes of the communication of motion. It would employ much time and room to fate them here ; and we apprehend that it is unnecef. fary: for no reafon ean be afligned why the preflure thuuld be in any particular oblique direction. If any one fhould fay that the impulfe will be in the direction of the Atream, we have only to defire him to take notice of the effect of the rudder of a thip. This fhows that the impulfe is not in the direction of the frean, and is therefore in fome direction traniverfe to the ftreamHe will alfo find, that when a plane furface is impelled obliquely by a fluid, there is no direction in which it can be fupported but the direction perpendicular to itfelf. It is quite fafe, in the mean time, to take it as an experimental truth. Wc may, perhaps, in fome other part of this work, give what whll be received as a rigorous demonftration.

Relative or efferive impatfe means the preflure on the furface eftimated in iome particular direction. Thus BC (fig. 1.) may repuefent the fail of a thip, impelled by ti,e wind blowing in the direction DC. GO may be the direction of the Mip's keel, or the line of her courfe. The wind ftrikes the fail in the direction GH parallel to DC ; the fail is urged or preffed in the direction GI, perpendicular to 13C. But we are interelted to know what tendency this will give the lhip to move in the diredtion GO. This is the effedive or relative impulfe. Or BC may be the tranliverie feation of the fail of a common wind-mith. This, by the contruction of the machne, ean muve only in the direction GI', perpendicular to the direction of the wind; and it is only in this direction thit the impulfe produces the defired effer. Or liC may be half of the prow of a punt or lighter, riding at anchor by means of the cable DC, attached to the p:ow C. In this cafe, GQ, parallel to DC , is that part of the ablolute impulie whith is employed in Atraining the cable.
] に E S
The amsic of incilizace is the angle FGC contained R fiflance. between the direction of the Heam IFG and the plane BC.

The argle of obliquity is the angle OGC contained betwcen t.ie plane and the direction GO, in which we wills to ellimate the impulie.
Prop. II. The direet impulic of a fluid on a plane furfice, is to its abr lute oblique impulie on the fame furfice, ats the fiquare of the radius to the iquare of the tine of the angle of incidence.
Let a ftrcan of fluid, moving in the direction DC, (fis. r.), att on the planc BC. With the radius CB deferibe the quadrant ABE; draw CA perperdicular to CE, and dtaw MNBS parallel to CE. Let the particle F, moving in the dirction FG, meet the plane in G, and in FG produced take GH to reprefent the magnitude of the dirat impulie, or the impule which the partiele would exert on the plane AC, by me.ting it in V. Draw GI and HK perpendicular to BC, and IlI perpendicular to GI. Alfo draw BR perpendicular to DC.

The force GH is equivalent to the two forces GI and GK ; and GK being in the direction of the plane has no thare in the impulfe. The ablolute impulfe, therefore, is reprcfented by GI; the angle GHI is equal to FGC, the angle of incidence; and therefore GH is to Gl as radius to the fine of the angla of incidence: Therefore the dired impulfe of e:tch particle or filament is to its abfolute cblique impulfe as radius to the fine of the angle of incidence. But further, the number of particles or filaments which Arike the furface $\hat{A} \mathrm{C}$, is to the number of thofe which frike the furface $B C$ as $A C$ to NC: for all the filaments between LA and MB go palt the oblique furface $B C$ without Ariking it. But $B C: N C=$ rad. : fin. $\mathrm{NBC},=\mathrm{rad} .:$ fin. $\mathrm{FGC},=\mathrm{rad} .:$ fin. incidence. Now the whole impulfe is as the impulfe of each filament, and as the number of filaments exerting equal impulfes jointly ; therefore the whole direet impulfe on AC is to the whole ablolute impulfe on BC , as the fquare of radius to the fquare of the fine of the angle of incidence.

Let $S$ exprefs the extent of the furface, $i$ the angle of incidence, o the angle of obliquity, $v$ the velocity of the fluid, and $d$ its denfity. Let $F$ reprefent the diret impulfe, $f$ the abfolute oblique impulfe, and $\theta$ the relative or effective impulfe: and let the tabular fines and colines be contidered as decimul frastions of the radius unity.

This propofition gives us $\mathrm{F}: f=\mathrm{R}^{2}: \operatorname{Sin} .{ }^{3} i,=1$ : $\operatorname{Sin}{ }^{2} i$, ard de erefore $f=F \times \operatorname{Sin} .{ }^{2} i$. Alfo, hecaufe impulfes are in the proportion of the extent of furface fimilarly impelled, we have, in general, $f=\mathrm{FS} x$ Sin. ${ }^{2}, i$.

The firt who publifhed this theorem was Pardics, in his Ocuvres de Mathematigue, in 1673 . We know that Newton had invelfigated the chief prepofitions of the Principia before $16 \% 0$.
Prop. III. The dires impulfe on any furface is to the $\frac{18}{18}$ - Ifcetive oblique impulfe on the fame furiace, as the cube of radius to the folid, which has for its bafe the fquat of the fine of iucidence, and the fine of obliquity fur its height.

## R E S

Pefinance. $\underbrace{8 \rightarrow \sim}$ the angle of nhliquity.

Therefore $f: \varphi=R$ : Sin. O.
But $\quad F: f=R^{2}: \operatorname{Sin}^{2}{ }^{2}$
Therefore $\mathrm{F}: ~ ¢=\mathrm{R}^{3}: \operatorname{Sin} .^{2} i \times$ Sin. O. and
इ) $\quad=\bar{F} \times \operatorname{Sin} .{ }^{2} i \times \operatorname{Sin} .0$.
Cor.-The direct impulfe on any furface is to the effective oblique impulfe in the direction of the fream, as the cube of radius to the cube of the fine of incidence. For draw I Q and GP perpendicular to GH, and IP perpendiculat to GP; then the abfolute impulfe GI is equivalent to the impulie GQ in the direction of the frean?, and GP, which may be called the tranfuerfe impulf. The angle G I Q is cvidently equal to the angle GH , or FGC , the angle of incidence.
 And $\varphi=F \times$ Sin. $\bar{\circ}$.

Before we proceed further, we fhall confider the im-
Impulfe on 2 furface in मuotion.

Ilste ceccrxyvi. rection and velocity DE , meet a plane BC , (fig. I $n^{\circ} 2$.), which is moving parallel to itfelf in the direction and with the velocity DF: It is required to determine the impulfe?

Nothing is more eafy : The mutual actions of bodies depend on their relative morions only. The motion DE of the flnid relative to BC , which is alfo in motion, is compounded of the real motion of the fluid and the oppofite to the real mation of the body. Therefore produce FD till $\mathrm{D} f=\mathrm{DI}$, and complete the parallelogram $\mathrm{D} f e \mathrm{E}$, and draw the diagonal 1) e. The impulie on the plane is the fame as if the plane were at reft, and every particle of the fluid impelled it in the direation and with the velocity $\mathrm{D}_{e}$; and may therefore be determined by the foregoing propofition. This propofition applies to every polibile care; and we thall not beftow more time on it, but referve the important modification of the general prupofition for the cafes which thall occur in the practical applications of the whole doctrine of the impulfe and refiltance of fluids.
Proportion $P_{\text {ropp }}$ IV. The direat impulfe of a fream of fluid, of the dim sect impulfe of a given flieam 10 the effective obJique impulfe in she fame direction. pulfe on a furface which is alfo in motion. This is evidently a frequent and an important cafe. It is perhaps the mof frequent and important : It is the catic of a llip under fail, and of a wind or water-mill at work.

Therefore, let a fream of fluid, moving with the di-
whofe breadth is given, is 10 its oblique effective impulfe in the direation of the ftream, as the fquare of radias to the fquare of the fine of the angle of incidence.
For the number of filaments which occupy the ob-
For the number of flaments which occupy the ob-
lique plane BC, would occupy the protion NC of a perpendicular plane, and therefore we have only to compare the perpendicular impulfe on any point $V$ with compare the perpendiculir impulfe on any point $V$ with
the effective impulfe made by the fame fiament FV on the oblique plane at $G$. Now GH reprefents the im pulie which this filament wonld make at V ; and GQ is the effective inpulie of the fame filament at G, efti-
mated in the direction GH of the liream; and GH is is the effective inpulic of the fame filament at G, efti-
mated in the direction GH of the liream; and GH is to GQ as $\mathrm{GH}{ }^{2}$ to $\mathrm{GI}^{2}$, that is, as rad. ${ }^{2}$ to fin. ${ }^{2}$. to GQas $\mathrm{GH}^{2}$,
Vol. XVI,

## R E S

Cor. 1. The effective impulfe in the diretion of the Refifisnce. Arcam on any plane furface $B C$, is to the direct impulfe on its bate BR or SE, as the fquare of the fine of the angle of incidence to the fquare of the radius.
2. If an ifficeles wedge $A C B$ (fig. 2.) be expofed to a fream of fluid moving in the direction of its height CD, the impulfe on the fides is to the direa impulfe on the hafe as the fquare of half the bafe AD to the fquare of the fide AC , or as the fquare of the fine of half the angle of the wedge to the fquare of the radius. For it is evident, that in this cafe the two tranfverfe impulies, fuch as GP in fig. I, balance each other, and the only impulie which can be obferved is the fum of the two impulfes, fuch as GQ of fig. I, which are to be compared with the impulfes on the two halves AD, $D B$ of the bafe. Now $A C: A B=$ rad. : fin. $A C D$, and $A C D$ is equal to the angle of incidence.

Theretore, if the angle $A C B$ is a right angle, and $A C D$ is half a right angle, the fquare of $A C$ is twice the iquare of $A D$, and the impulfe on the fides of a rectangular wedge is half the impulfe on its bafe.

Alo, if a cube ACBE (fig. 3.) be expofed to a Atream moving in a direction perpendicular to one of its fides, and then to a ftream moving in a direction perpendicular to one of its diagonal planes, the impulfe in the firt care will be to the impulfe in the fecond as $\sqrt{2}$ to 1 . Call the perpendicular impulfe on a fide $F$, and the perpendicular impulfe on its diagonal plane $f$, and the effective oblique impulfe on its fides $\varphi$;-we have

$$
\begin{aligned}
& F: f=A C: A B=1: \sqrt{2}, \text { and } \\
& f: \phi=A C^{2}: A D^{2}=2: 1, \text { Therefore } \\
& F: \&= \\
& 2: \sqrt{2}=\sqrt{2}: 1, \text { or }
\end{aligned}
$$

very nearly as 10 to 7 .
The fame reafoning will apply to a pyramid whofe bafe is a regular polygon, and whofe axis is perpendicular to the bafe. If fuch a pyramid is expofed to a ftream of Huid moving in the direction of the axis, the direct impulfe on the bate is to the effective impulfe on the prramid, as the fquare of the radius to the fquare of the fine of the angle which the axis makes with the fides of the pyramid.

And, in like manner, the direct impulion on the bafe of a right cone is to the effective impulfion on the conical furiace, as the fquare of the radius to the fquare of the fine of half the angle at the vertex of the cone. This is demonftrated, by fuppofing the cone to be a pyramid of a number of fides.

We may in this manner compare the impulfe on any polygonal furface with the impulfe on its bafe, by compaing apart the impulfes on each plane with thofe in their correfponding baies, and taking their fum.

And we may compare the impulif on a curved fur. face with that on its bafe, by refolving the curved furface inio elementary planes, each of which is impelled by an elementary filament of the ftream.

The following beatuiful propoftion, given by Le Seur and Juquier, in their Commentary on the fecond Book of Newron's Princıpia, with a few examples of its application, will fuffice for any further account of this theory.
Prop. V.-Let ADB (fig. 4.) be the fection of a furace tet ADB (ho. 4 ) be the fection of a curved furfurface of fimple curvature, fuch as is the furface of face coma cylinder. Let this be cxpofed to the act:on of a pared with fluid moving in the direction AC. Let BC be the that on its N
fection

## R E S

fedtion of the plane (which we have called its lafe), known, that the parabolic area BMGC is two thirds Refitance. perpendicular to the direction of the ftream. $\ln A C$ produced, take anv length CG ; and on CG defcribe the femicircle CHG, and complete the reatangle BCGO. Through any point 1 ) of the curve draw ED parallel to AC , and meeting BC and OG in Q and $P$. Let DF touch the curve in 1), and draw the chord GH parallel to DF , and HKM perpendicular to CG, meeting ED in M. Suppofe this to be done for esery point of the curve ADB , and let LMN be the curve which palfes through all the points of interfestion of the parallels EDP and the correfponding perpendiculars HKM.

The effective impulfe on the curve furface $A D B$ in the direction of the ilream, is to its direet impulie on the bafe BC as the area of 1 CNL is to the retangle BCGO.
1)raw e a $q m p$ parallel to EP and extremely near it. The unch $\mathrm{D} d$ of the curve may be conceived as the fection of anclementary plane, having the pofition of the tangent DF. The angle EDF is the angle of incidence of the filament E1 de. This is equal to CGH, becaufe ED, DF, are parallel to CG, GH; and (becaufe CHG is a femicircle) CH is perpendicular to GH. Alfo $\mathrm{CG}: \mathrm{CH}=\mathrm{CH}: \mathrm{CK}$, and $\mathrm{CG}: \mathrm{CK}=$ $\mathrm{CG}^{2}: \mathrm{CH}^{2},=$ rad. $^{2}:$ fin. $^{.}, \mathrm{CGH},=$ rad. ${ }^{2}:$ fin. ${ }^{*} \mathrm{in}-$ cid. Therefore if CG, or its equal DP, reprefent the direet impulfe on the point $Q$ of the bafe, CK, or its equal CMI, will reprefent the effective impulfe on the point $D$ of the carve. And thus, Qqp P will reprefent the direct impulfe of the flament en the element Q $q$ of the bafe, and $\mathrm{Q}_{q m} \mathrm{M}$ will reprefent the effedive impulfe of the fame filament on the element $\mathrm{D} d$ of the curve. And, as this is true of the whole curve ADB , the effective impulfe on the whole curve will be reprefented by the area BCNML; and the direat impulfe on the bafe will be reprefented by the rectangle BCGO; and therefore the impule on the curvefiurface is to the impulie on the bafe as the area BLMNC - In the reftangle JiOGC.

1- is plain, from the confruction, that if the tangent a the curve at A is perpendicular to AC , the point N will coincide with G. Alfo, if the tangent to the : urbe at I is parallel to AC, the point L will coincide थith B.

Wrenever, theceff re, the curve ADB is fuch that an - quatior can be had to exhibit the general relation be:" ecn the alpeifa $A R$ and the ordinate $D R$, we frall SUnce an ecgution which exhibits the relation between :ac abfirs CK and the ordinate KM of the curve CimN; and this will give us the ratio of BLNC to suCC.

Thime, if the furface is that of a cylinder, fo that the arve BDA b (fig. 5.), which receives the impulic of the fluid, is a femicirele, make CG equal to AC, and contru? the figure as before. Thic curve BMG is a zurabola, whode axis is $C(B$, whofe vertex is $G$, and whote parameter is equal to CG . For it is plain, that $\mathrm{C}:=\mathrm{DC}$, and $\mathrm{GH}=\mathrm{CQ},=\mathrm{Mli}$. And $\mathrm{CG} \times \mathrm{GF}$ $=\mathrm{GH}^{2}=\mathrm{KM}{ }^{\circ}$. That is, the curve is fuch, that the iquare of the ordinate $K \mathrm{M}$ is cqual to the rectangle of the abcifia GlK and a conflant line GC ; and it is therefore a parabola whare vertex i. G. Now, it is well
of the parallelogram BCGO Therefore the inpulfe on the quadrant ADB is two thirds of the impulfe on the bafe 13C. The fame may be faid of the quadrant 23 A $d b$ and its bate $c b$. Therefore, The infulfe on a $c y-$ The imlinder or balf cylinder is two thirds of the dired impulfe on pulfe on a its traverfe plane through the axis; or it is two thinds cylinder, of the direct impulfe on one fide of a parallelopiped of the fame breadth and height.
Prop. VI.-If the body be a folid generated by the revolution of the figure BDAC (fig. 4.) round the axis AC ; and if it be expofed to the ataion of a Aream of lluid moving in the dieetion of the axis $A C$; then the effective impulfe in the direction of the ftream is to the diect impulfe on its bafe, as the folid generated by the rev lution of the figure BLMNC, round the axis CN to the cylinder generated by the revolution of the rectangle BOGC.
This fearcely needs a demonftration. The figure ADBLMNA is a feation of thele folids by a plane pafing through the axis; and what has been demonftrated of this leation is true of every other, becaufe they are all equal and fimilat. It is therefore true of the whole fulids, and (their bafe) the circle generated by the revolution of BC round the axis AC .

Hence we eafily deduce, that The impulfe on a fphere On an is one balf of the direat impulfe on its great circle, or on the fyhere⿻ bafe of a cylindir of equ..l diameter.
For in this cate the curve BMN (fig. 5.) which generates the folid expreffing the impulie on the fphere is a parabola, and the fold is a parabr lic conoid. Now this conoid is the cylinder generated by the revolution of the reflangle BOGC round the axis CG, as the fum of all the circles generated by the revolution of ordinates to the parobala fuch as KM , to the fum of as many cireles generated by the ordinates to the rectangle fuch as T ; or as the fum of all the fquares defcribed on the ordithates KM to the fum of as many fquares defcribed on the ordinates KT. Draw BG cutting MK in S. The fquare on MK is to the fquare on BC or TKi as the abricifa GK to the abfciffa GC (by the nature of the parabula), or as SK to BC; becaufe SK and BC are refpesively equal to GK and GC. Therefore the fum of all the fquares on or dinates, fuch as MK , is to the rum of as many fquares on ordinates, fuch as TK, as the fum of all the lines SK to the fum of as many lines TKK ; that is, as the triangle BGC to the rectangle BOGC ; that is, as one to two: and therefore the impulfe on the fphere is one half of the dirent impulfe on its great circle.

From the fame confruction we may very cafily de- $n_{n}{ }^{25}$ duce a very curious and feemingly ufeful truth, that of frunum of all conical budies having the eircle whofe diameter is a cone. $A B$ (fig. 2.) for its bafe, and FD for its height, the one which fuftains the fmalleft impulie or teeets with the fmalleft reliftance is the fruftum AGHB of a cone ACD fo confructed, that EF being taken equal to ED, EA is equal to EC. This fruftum, though more capacious than the cone AFB of the fame height, will be lefs refitled.

Alro, if the folid generated by the revolution of BDAC (fig. 4.) have its anterior part covered with it frulum of a cone generated by the lines $D a, a, A$,
forming

## RES [ [ 99$]$ RES

Reffauce. forming the angle at a of 135 degrees; this folid, water, whofe tafe is a fquare foot, and whof height is R fiftance. though more capacious than the included folid, will be lel's refifted.

And, frem the fame principles, Sir Ifac Newton determined the form of the curve ADB which would generate the folid which, of all others of the fame length and bafe, fhould have the lealt refiftance.

Thefe are curious and important deductions, but are not introduced here, for reafons which will foon ap. pear.

The reader cannot fail to obferve, that all that we have hitherto delivered on this fubjest, relates to the comparifon of different impulfes or refifances. We have always compared the oblique impullions with the direst, and by their intervention we compare the oblique impulions with each other. But it remains to give abfolute meafures of fome individual impulfion ; to which, as to an unit, we may refer every other. And as it is by their preffure that they become ufeful or hurtful, and they muft be oppofes by other preffures, it becomes extremely convenient to comp:rre them all with that preffure with which we are molt familiarly acquainted, the preffure of gravity.

The manner in which the comparifon is made, is this. When a body advances in a fluid with a known velocity, it puts a known quantity of the fluid into motion (as is fuppofed) with this velocity; and this is done in a known time. We have only to examine what weighc will put this quantity of fllid inco the fame motion, by atting on it during the fame time. This weight is conceived as equal to the refiftance. Thus, let us fuppofe that a fteam of water, moving at the rate of eight feet per fecond, is perpenticularly obftructed by a fquare foot of folid firface held fatt in its place. Conceiving water to act in the manncr of the hypothetical fluid now defcribed, and to be without clafticity, the whole effect is the gradual annihilation of the motion of eight cubic feet of water moving eight feet in a fecond. And this is done in a fecond of timc. It is equivalent to the gradually putting eight cubic feet of water into motion with this velocity; and ding this by acting uniformly during a fecond. What weight is able to produce this eftect? The weight of eizhit feet of water, acting dutring a fecond on it, will, as is well known, give it the velocity of thinty two feet per fecond; that is, feur times greater. Therefore, the weight of the fourth part of eight cubic feet, that is, the weight of two culbic feet, acting during a fecond, will do the fame thing, or the weight of column of water whofe bafe is a aquare font, and whole height is two feet. This will not only produce this effert in the fame time with the im. pultion of the folid body, but it will :alfo do it by the fame degrees, as any ore will clearly perceive, by attending to the gradual acceleration of the mafs of water urged by $\frac{1}{\frac{1}{2}}$ of its weight, and comparing this with the gradual produstion or extination of motion it the thuid by the progrefs of the refited furfice.

N w it is well known that 8 cubic feet of water, by falling one foot, which it will do in one-fourth of a lecond, will acquire the velocity of eight feet per fecond by its weight; therefore the force which produces the fame effce in a whole fecord is one-fourth of this. This force is therefore equal to the weight of a columia of
two feet ; that is, twice the height neceffary for acquiring the velocity of the motion by gravity. The conclufion is the fame whatever be the furface that is refitied, whatever be the fluid that reiffs, and whatever be the velocity of the motion. In this inductive and familiar manner we learn, that the direct impulfe or refilunce of an unelyfici fuite on any plane furface, is cqual to the zueight of a column of the fluid baving the furface for its lafe, and twitce the fall neceflary for acquiring the velacity of the motion for its leight: and if the fluid is confidered as elaftic, the impulfe or refiftance is twice as great. See Newt. Prin ip. B. II. prop. 35. and 38.

It now remains to compare this theory with experi- Thistheory ment. Many lave been made, both by Sir Ifaac New- tried by ton and by fubfequent writers. It is much to be 12 - different mented, that in a matter of fuch importance, both to experithe philofopher and to the artifl, there is fuch a difagreement in the refults with each other. We fhall mention the experiments which feem to have been made with the greateft judgment and care. Thofe of Sir Ifaac Newton were chiefly made by the ofcillations of pendulums in water, and by the defcent of balls both in water and in air. Many have been made by Mariotte (Traite de Mouvement des Eaux.). Gravefande has publithed, in his Sylem of Natural Philofophy, experiments made on the retiftance or impulions on folids in the midr of a pipe or canal. They are extremely well contrived, but are on fo fmall a fcale that they are of very little ufe. Daniel Bernoulli, and his pupil Profeffur Kraff, have publifhed, in the Comment. Acad. Petropol. experiments on the impulfe of a fream or vein of water from an orifice or tube: Thefe are of great value. The Abbé Boffut has publifhed others of the fame kind in his Hydrodynamique. Mr Robins has publifhed, in his Nero principlis of Gunncry, many valuable experiments on the impulfe and refiftance of air. The Chev. de Borda, in the Mem. Acad. Paris, 1763 and 1767 , has given experiments on the refiftance of air and alfo of water, which are very interefting. The moft complete collection of experiments on the refiftance of water are thofe made at the public expence by a committee of the academy of fciences, confifing of the marquis de Condorcet, Mr d'Alembert, Abbé Boffut, and others. The Chev. de Buat, in his Hydrauliquc, has publifhed fome moof curious and valuable experiments, where many important circumftances are taken notice of, which had never been attended to belore, and which give a view of the fullje? totally different from what is ufually taken of it. Don George d'Ulloa, in his Examine Maritino, has alfo given fome important experiments, fimiIur to thole adduced by Bougeur in his Manauve des $V$ aif:cuux, but leading to very different conclufions. All thefe thould be confulted by fuch as would acquire a practical knowledge of this fubject. We muft content ourfelves with giving their moft general and fleady refults. Such as,

1. It is very confonant to experiment that the refiftances are proportional to the fquares of the velocities. Whan the velocities of water do not exceed a few feet per fecond, no fenfible deviation is obferved. In very frmall velocities the refiftances are fenfibly greater thau in this proportion, and this excefs is plainly owing to the vifcidity or imperfect fluidity of water. Sir Ifacac

## R E S <br> R E S

Reflame. Newton has fhown that the reliftance asiing from this caufe is conftant, or the fame in every velocity; and when he has taken oft a certain part of the total refifsance, he found the remainder was very exactly proportionable to the fquare of the velocity. His experiments to this purpofe were made with balls a very little heavier than water, fo as to defend very flowly; and they were made with his uftual care and acturacy, and may be depended on.

In the experiments made with bodies floating on the furface of water, there is an addition to the refiftance arifing from the inertia of the water. The water heaps up a little on the anterior farface of the floating body, and is depreffed behtid it. Hence arifes a hydroftatical prelfure, asting in concert with the truc reliftance. A liminar thing is obferved in the reffance of air, which is cendenfed before the body and ravefied behind it, and thus an additional refiftanec is produced by the unbalaneed claficity of the air; and alfo becaufe the air, which is afualiy difplaced, is denfer than cummon air. These circumfances cande the refiftances to increate fafter than the fquares of the valocities: but, even independent of this, there is an additional refiftance arifing foom the tendency to rasefastion behind at very fwift body; becaufe the prelitere of the furrounding Auid can only make the fluid fill the frace left with a determincd velocity.

We have had occafion to fpeak of this circumfance more particularly under Guesery and Preumatics, when confidering very rapid motions. Mr Robi shad remarked that the velocity at which the obferved ac fiftance of the air began to increafe fo prodigioufy, was that of about 1100 or 1200 feet per fecond, and that this was the velocity with which air we uld ruth into a void. He concluded, that when the velocity was greater than this, the ball was exprfed to the additional refitance arifing from the unbalanced thatical preffire of the air, and that this confant quantity behoved to be added to the refiftance ariling from the air's inertia in all greater velccities. This is very reafonable: But he imagined that in fmaller velocities there was no fuch unbalanced preffure. But this cannot be the cafe : for although in fmaller velocities the air will ftill fill up the Ppace behind the body, it will not fill it up with air of the fame denfity. This would be to fuppofe the motion of the air into the deferted place to be inffantancous. There mult therefere be a raref.action behind the body, and a peffure hackward : arifing from unbalan. ced elatticity, independent of the condenfation on the anterior part. The combenfation and rarefation are caufed by the fame thing, wiz. the limited elatticity of the air. Were this intinitely grat, the fmallef condenfation before the body would be inftuntly diffuled over the whole air, and fo would the ratefation, fo that no preffure of urbalanced clafticity would be olferved ; but the clafticity is fuch as to propagate the condenfation with the velecity of found only, i.e. the velocity of 1142 feet per fecond. Therefore this additional refiftance does not commence frecifely at this velocity, but is fenfible in all fenaller velocities, as is very jufly - therved by Euler. But we are not yet able to afcertain the law of its increafe, although it is a problem which feems fufceptible of a tolerably accurate folv)

Precifely fimilar to this is the refiftance to the mo- Refiftance. tion of Hoating bodies, arifing from the accumulation or golging up of the water on their anterior furface, and its depreflion behind them. Were the gravity of the water infinite, while its inertia remains the fatne, the wave raifed ujat the prow of a fhip would be infantly diffufed over the whole ncean, and it would therefore be infinitely mall, as atio the depreflion behind the poop. But this wave requires time for its diffufion ; and while it is not difufed, it afts by hydrufatical preffure. We are equally unable to afcertain the law of variation of this part of the reliftance, the mechanimı of waves being but very imperfectly underftood. The height of the wave in the experiments of the French academy could not be mealured with fufficient precillion (being only oblerved on foffint) for afcertaining its relation to the velocity. The Chev. Buat attempted it in his experiments, but withont fucce:s. This mult evidently tnake a part of the refiftance in all velacities: and it fill remains an undecided quenion, "What relation it hears to the velocities?" When the folid body is wholiy buried in the flnid, this accumulation does not take place, or at leall not in the fame way: le may, however, be ubfensed Every ferion may recollent, that in a very fwit running thedro a large fone at the botom will produce a mall fivell above it ; unlefs it lies very deep, a rice eye may ftill ubferve it. The water, on arri in , at the obltacle, glides patt it in every direction, and is deflected on all hands; and therefore what paffe, over it is alfo defected upwards, ind caufes the water over it to rife above its level. The nearer that the body is to the furface, the greater will be the perpendicular rife of the water, but it will be le's dffufed; and it is uncertain whether the aubole elevation will be greater or lefs. By the whole elevation we mean the area of a perpendicular fection of the elevation by a plane perpendicular to the direction of the Aream. We a:e rather difpofed to think that this area will be greatef when the body is near the furface. D'Ulloa has attempted to confider this fubject fcientifically; and is of a very different opinion, which he confirms by the fingle experiment to be mentioned by and by. Mean time, it is evident, that if the water which glides paft the body camot fall in behind it with frfficient velocity for filling up the pace behind, there mult be a void there ; and thus a hydroftatical preffire mult be fuperadded to the refiltance arifing from the inertin of the water. All muft have obferved, that if the end of a ftick held in the hand be drawn flowly through the watcr, the water will till the place left by the tlick, and there will be no curled wave: but if the motion be very rapid, a hollow trough or gutter is left behind, and is not filled up till at fome diftance from the fick, and the wave which fornis its fides is vary much broken and curled. The wititer of this article has often looked into the water from the poop of a fecond rate man of war when the was failing is miles per hour, which is a velocity of 16 feet per fecond ne.rrly; and he not only obferved that the back of the rudder was naked for about two feet below the load water-line, but allo that the trough or wake made by the thip was filled up with water which was broken and foaming to a conliderable depth, and to a confiderable difance from the veficl: There mult therefore have been 3 void.
$\underbrace{\text { Reffrance. a void. He never faw the wake perfectly tranfparent }}$ (and therefore completely filled with water) when the velocity exceeded 9 or so feet per fecond. While this bruken water is oblerved, there can be no dcubt that there is a void and an additional refiftance. But even when the fpace left by the body, or the face behind a Atill body expofed to a flrcam, is completely filled, it may not be filled fufficiently faft, and there may be (and certainly is, as we habl fee aflerwards) a quantity of water behind the body, which is moving more flowly awaty than the reft, and therefore hangs in fome lhape by the body, and is dragged by it, increafing the refiftance. The quantity of this mutt depend partly on the velocity of the body or ftream, and partly on the rapidity with which the furrounding water comes in behind. This laft muft depend on the preffure of the furrounding water. It would appear, that when this adjoming prefluse is very great, as mult happen when the depth is great, the augmentation of refitance now fpoken of would be lefs. Accordingly this appears in Newton's experiments, where the balls were leis retarded as they were deeper under water.

Thefe experiments' are fo fimple in their nature, and were made wich fuch care, and by a perfon fo able to detest and appreciate every circumltance, that they deferve great credit, and the conclutions legitiniately drawn from them deferve to be conlidered as phyfical laws. We think that the preferit deduction is unexceptionable : for in the motion of balls, which hardly defcended, their preponderancy being hardly fenfible, the effest of depth muit have borne 2 very great proportion to the whole refiftance, and mult have greatly influenced their motions; yet they were obferved to fall as if the refiltance had no way depended on the depth.

The fame thing appears in Borda's experiments, where a fphere which was deeply immeried in the water was lefs refinted than one that moved with the fame velocity near the furface; and this was very conflant and aegular in a courfe of expariments. D'Ulloa, however, allirms the contrary: He fays that the retiflance of a board, which was a foot broad, immeried one foot in a flream moving two feet per lecond, was $15 \frac{1}{2}$ lbs. and the refiflance to the fame boatd, when immerfed 2 feet in a ltream moving $1 \frac{1}{5}$ feet per fecond (in which cafe the firface was 2 feet), was $26 \frac{2}{4}$ pounds (A).

We are very forry that we cannot give a proper account of this theory' of refiftance by Doa Ceorge Juan D'Ulloa, an author ot great mathematical reputation, and the infector of the marine academics in Spain. We have not been able to procure either the original or the French tranflation, and judge of it only by an estract by Mr Prony in his Arcbitec̄ure Hydraulique, $\delta 868$. \&c. The theory is enveloped (according to Mr Pio. ny's cuftom) ia the moft complicated expreffions, io that the phyfical principles are kept aimott out of fight. When accommodated to the fimpleft poffible eafe, it is nearly as follows.

Let $o$ be an elementary orifice or portion of the furface of the fide of a velfel filled with a heary fluid, and let $b$ be its depth under the horizontal furface of the fluid. Let of be the denfity of the flu:d, and $Q$ the ac-
celerative power of gravity, $=32$ feet velocity aequi. RefiRasm. red in a fecond.
It is known, fays he, that the water would flow out at this hole with the velocity $u=\sqrt{2 q b}$, and $u^{2}=2<b$ and $b=\frac{u^{2}}{2 \varphi}$. It is alfo known that the preffure $p$ on
the orifice 0 is $\operatorname{Oos} b,=\cos \frac{u^{2}}{2 \phi},=\frac{1}{2} 80 u^{2}$.
Nuw let this little furface o be fuppofed to move with the velccity $v$. The Hluid would meet it with the velocity $u+v$, or $u-v$, according as it moved in the oppofite or in the farme direction with the eflux. In the equation $p=\frac{1}{2} \& 0 u^{2}$, fublitute $u \rightleftharpoons v$ for $u$, and we have the preffure on $a=p=\frac{\delta 0}{2}(u \neq v)^{\prime},=\frac{d \theta}{2}$ $\left(\sqrt{2 \rho}=v^{2}\right)$.

This prefure is a weight, that is, a mafs of matter $m$ actuated by gravity $\phi$, or $p=\phi m$, and $m=\delta \theta$ $\left(\sqrt{b}=\frac{v}{\sqrt{2 \phi}}\right)^{2}$.

This elementary furface being immerfed in a fag. nant fluid, and moved with the velocity $\sigma$, will fuftain on one fide a preflure so $\left(\sqrt{ } b+\frac{v}{\sqrt{20}}\right)^{2}$ and on the other fide a preffure $s \circ\left(\sqrt{b}-\frac{v}{\sqrt{2 \phi}}\right)^{2}$; and the fen. fible retiftance will be the difference of thefe two preffures, which is $804 \sqrt{ } \frac{v}{\sqrt{ } 2 \phi}$, or $804 \sqrt{ } b \frac{v}{8}$, thite is, $\frac{50 \sqrt{ } b v}{2}$, becaufe $\sqrt{2 \varphi}=8$; a quantity which is in the fubduplicate ratio of the depth under the furface of the fluid, and the fimple ratio of the velocity of the refifted furface jointly.

There is nothing in experimental philofophy more certain than that the refiftances are very nearly in the duplicate ratio of the velocities; and we cannot conceive by what experiments the ingenius author has fupp.rted this conclefion.
But there is, befides, what appears to us to be an Defect in effential defect in this inveftigation. The equation ex-his inveftihibits no refillance in the cafe of a fluid without weight. gation.
Now a thenry of the refiftance of fluids flould extihit the reardation arifing from inertia alone, and thould diAtinguilh it from that arifing from any other caufe: and moreover, while it afigns an ultimate fenfible refiftance proportional (cateris paribus) to the fimple velocity, it aflumes as a firft principle that the preflure $p$ is as $u={ }_{v}$. It alfo gives a fulfe meafure of the fatical preffures: for thele (in the cafe of bodies immerfed in our waters at leaft) are made up of the preflure of the incumbent water, which is meafired by $b$, and the prelfure of the atmafoh ere, a coullant quantity.

Whaterer reation can be given for fetting out with the principle that the prefiuse on the litile furrace $n$, moving with the velocity $u$, is equal to $\frac{3}{2} \delta 0(u=15)^{2}$, makes it indifpenfably neceflary to take for the velocity
(1) There is fomething very unaccountable in theic experiments. The refifances are much greater thas any ether author has obferved.

12 r'are. i, ne: that with which water would ifive from a hole -n whaf: dep:l under the furtace is $l$, but the velecity rith which it will iflue from a hele whofe derth is $1:+33$ feet. Becaufe the preflure of the atn:oiplere in equal to that oi a column of water 33 fert 1.i h: f r thin is the acknowledged velocity with which it "Mald rulh in to the void lift by the bodg. If therctore this velocity (which does not exiff) has any flare in the efors, we mut have for the flaxion of pe.fure not $\frac{4 \sqrt{1 v}}{\sqrt{29}}$ bui $\frac{4 \sqrt{k+}}{\sqrt{23}}$. This would not oally give preflure or refiftences many times exceeding thode that $h$ ave been obferved in our experiments, but would alfo totally change the proprotiuns which this the ry determines. It was at al $y$ rate improper to embarrafs an inveltigation, alrcady very intricate, with the preflite of gravity, and with two motions of eflux, which do not exith, and are neceflary fur making the reffures in the ratio of $\overline{u+} \overline{v^{2}}$ and $\bar{u}=v^{2}$.

Mr Prony las been at no pains to inform his readers of his reafons for adopting this theory of refiftance, fo contrary to all received opinions, and to the moft dittingt experiments. Thofe of the lirench academy, made under greater prelfures, gave a much fmaller refiftance; and the very experiments adduced in fupport of this theory are extremels deficient, wanting fully $\frac{1}{5} d$ of what the theory requires. The refiltances by experiment were $15 \frac{1}{\frac{1}{2}}$ and $26 \frac{1}{3}$, and the theory required $20 \frac{1}{2}$ and 39 . The equation, however, deduced from the theory is greatly deficient in the expreffion of the preffures caufed by the accumulation and depreflior, flating the height of them as $=\frac{v^{2}}{2 \varphi}$. They can never be fo high, becaule the heaped up water flows off at the fides, and it allo comes in behind by the fides ; fo that the preffure is much lefs than half the weight of a column whofe height is $\frac{7^{2}}{20}$; both becaufe the accumulation and deprefion are lefs at the fides than in the middle, and becaufe, when the body is wholly immerfed, the accumulation is greatly diminifhed. Indeed in this cafe the final equation does not include their effeas, though as real in this cafe as when part of the body is above uater.

Upon the whole, we are fomewhat furprifed that an author of 1)'Ulioa's eminence fhould have adopted :a theory fo unneceflaily and fo improperly embarraffed with foreign circumfances; and that Mr Prony fhuld have inferted it with the explanation by which he was to abide, in a work deltined for pratical ufe.
'Ihis point, or the effer of deep immerfion, is fill much contefted; and it is a reccived opinion, by many not accufomed t mathematical relearches, that the refinance is greater in greater depth:. This is affumed as an immertment pine ple liy Mr Gordon, author of $A$ theory if Trazal Archito ${ }^{2}$ ure: but on very vague and light grounds: and the an'l2 $r$ feems unacqu:inted with the manner of reatoning on fuch fubjects. It fhall be cuntidee! atienwartis.

With thefe corredions, it may be afferted that theory atid caperim-at agree very woll in chis refpect, and that the refillanee maty be afferted to be in the duplicate naltin $n$ : the velocity.

We have been more minute on this fubjeet, becaufe it is the leading propolition in the theory of the ac-
tinn of Ruide. Newton's demonllration of it takes no Refinance. notice of the maner in which the various particles of the fluid are put into motion, or the motion which each in particular acquires. He onfy lhows, that if there be nothing concerned in the communication brt pure inertia, the fum total of the mutions of the particles, eftimated in the diredion of the body's motion, or that of the ftream, will be in the cuplicate ratio of the velocity. It was therefore of importance to fhow that this part of the theory was jult. To do this, we had to confider the effeet of every circunifance which could be consbined with the inertia of the fluid. All thefe had been forefeen hy that great man, and are moft briefly, though perfpicuoufly, mentioned in the laft feholium to prop. 36. B. II.
2. It appears from a comparion of all the experi- impure ${ }^{2}$ ments, that the impulfes and refiftances are very nearly and refin. in the proportion of the furfaces. "lhey appear, how. ances nearever, to increafe fome what fafter than the furfaces. The Chevalier Borda found that the refiltance, with the fame velocity, to a furface of ly in proportion of

$$
\left.\begin{array}{l}
9 \text { inches }^{16} \\

36 \\
81
\end{array}\right.
$$

The deviation in thefe experiments from the theory increafes with the furface, and is probably much greater in the extenfive furfaces of the fails of thips and windmills, and the hulls of fhips.
3. The relifances do by no means vary in the duplicate ratio of the fines of the angles of incidence.

As this is the moft interefting circumftance, having a chief influence on all the particular modifications of the refifance of fluids, and as on this depends the whole theory of the conftruction and working of thips, and the action of water on our molt important machines, and feems molt immediately connedted with the mechanifm of fluids, it merits a very particular cenfideration. We camot do a greater fervice than by rendering more generally known thic excellent experiments of the French academy.

Fifteen boxes or veffels were confructed, which were two feet wide, and two feet deep, and four feet long. One of them was a parallclopiped of thete dimenfions; the others had prows of a wedge.form, the angle $A C B$ (fig. 7.) varying by $12^{\circ}$ degrees from $12^{\circ}$ to $180^{\circ}$; fo that the angle of incidence increafed by $6^{\circ}$ from one to another. Thefe boxes we:e dragged acrofs a very large bafing of facoth water (in which they were immerfed two fect) by means of a line paffing over a whec comneted with a cylinder, from which the afluating weigl. was futpended. The mution became perfeitly uniform aiter a very little way; and the tine of paffing over gf liten. heet with this miform motion was very carsfully noted. The refittarce was meafured by the weight employed, after dectuating a certain guantity (properly c(limated) for fridion, and for the accumulat on of the water agrainf the anterior furface. The refult of the many expenments are given in the following table ; where column if contains the angle of the prow, ef lumm 2d contains the refifance as given by the preceding tionry, column $3^{d}$ contains the refiftance exhibited in the experiments, and eclumn the contains the deviation of the expriment from the theory.

The refiftance to if fuare foot, French meafure, moving with the velocity of 2,56 feet per fecond, was very nearly 7,625 pounds French.

Reducing theie to Englifh meafures, we have the furface $=1,1363$ feet, the velocity of the motion equal to $2,72 \sigma_{3}$ feet per fecond, and the reliftance equal to $8,23+$ pounds avoirdupois. The weight of a column of frelh water of this bafe, and having for i:s height the fall neceffary for communicating this velocity, is $8,2 \sigma_{+}$pounds avoirdupois. The refiftances to other velocities were accurately proportional to the fquares of the velocities.

There is great diverfity in the value which different anthors have deduced for the abfolute refiftance of water from their experiments. In the value now given nothing is taken into account but the inertia of the water. The accumulation againft the forepart of the box was carefully noted, and the ftatical preffure backwards, arifing from this caufe, was fubtracted from the whole refiftance to the drag. There had not been a fufficient variety of experiments for difcovering the fhare which tenacity and fristion produced; fo that the number of pounds fet down here niay be confidered as fome what fuperior to the mere effeets of the inertia of the water. We think, upon the whole, that it is the mof accurate determination yet given of the refiflance to a bodj in motion: but we hall afterwards fee reafors for believing, that the impulfe of a running fream having the fame velocity is fomewhat greater; and this is the form in which moft of the experiments have been made.

Alfo obferve, that the reliftance here given is that to a veffel two feet broxd and deep and four feet long. The refifance to a plane of two feet broad and deep would probably have excceded this in the proportion of 15,22 to 14,54 , for reafons we fhall fee afterwards.
From the experiments of Chevalier Buat, it appears that a body of onc foot fquare, French meafure, and two feet long, having its centre : 5 inches under water, moving three Frencla feet per fecond, fuftained a preffure of 14,54 French pnunds, 15 15,63 Englifh. This reduced in the proportion of $3^{3}$ to $2,56^{2}$ gives 11,43 pounds, confiderably exceeding the 8,24 .

Mír Bouguer, in his Manxuvre des Vaffeaux, fays, that he found the refiftance of fea-water to a velocity of one foot tu be 23 ounces poids des Marc.

The Chevalier Borda found the refiftance of fea-water to the face of a cubic foot, moving againt the water one foot per fecond, to be 21 ounces nearly. But

> But this is exact enough for any prastic.

pantrer - - -

Thes is an abend.anty fimple formula; but we in:roduce is in cut cabulations of the refiltances ol curviliveal frow-, it renders them fo complicated as to be almode ne'cis; and what is werle, when the ealculation is compleied lit at cenvilacel rrow, the refillance which reliles is found to differ wide:y from experiment. 'This thows that the monn of the Huid is fomodifice by t.:.e astin $n$ of the moft pren incot part of the prow, that its impule on what fincecds is greatly afferted, fo that we are not allowed to conider ti e prow as compofed of a number of parts, each of which is afteeted as if it were ce:ached from thl the relt.

As the very nature of naval architecture feems to se. citisc curvilincal forms, in crder to give the neceflary lisength, it feemed of itr portance to cxamine more particularly the deviations of the refiftanees of fuch prows frem the refiftances atigned by the theory. The academicians therefore made veffels with prows of a cslin. drical hape; one of thefe was a half cylinder, and the wher was ne-third of a cylinder, both having the fane breadth, riz. two feet, the fame depth, alfo two feet, and the lame length, four feet. The refilance of the half cylinder was to the refiftance of the perpendicular prow in the proportion of 13 , to 25 , inftead of being as 13 to 19,5. The Chevalier 13orda found nearly the fatme ratio of the refiltances of the half cylinder, and its diametrical plane when mored in air. He allo compared the refillinces of turo pifms ur wedges, of the fame breadh and height. The firt hatd its fides plane, iacliued to the bafe in ang!es of $60^{\circ}$ : the fecond had its fides portions of cylinders, of which the planes were the chords, that is, their fections were arches of circles of $60^{\circ}$. Their refifances were as $\mathbf{3} 33$ to $\mathbf{1 0 0}$, inftead of being as 133 to 220 , as required by the thecry; and as the refiftance of the firt was greater in proportion to that of the bafe than the theory allows, the refifance of the latt was lefs.

Mr liobins found the refiftance of a fphere moving in air to be to the refiftance of its great circle as 1 to 2,27 ; whereas theory requites them to be as 1 to 2 . He found, at the fame time, that the abfolute refiftance was greater than the wight of a cylinder of air of the fame diamcter, and having the height neceffary for acquiring the velocity. It was greater in the propotion of 49 to 40 mearly.

Lorda found the refiftance of the fphere moving in water to be to that of its great ciscle as 1000 to 2508, and it was one ninth greater than the weight of the column of water whofe height was that necefiary for producing the velocity. He alfo found the reliftance of air to the fplecre was to its reliftance to its egreat circle as 1 to 2,45 .

The thesery g.ves fume refinances too fmall and wher too grea:.

It appears, on the whole, that the thecry gives the rcfitance of oblifgue plane farfaces wo fmall, and that cicurved furfi.ces ton great; and that it is quite unfit for afersaining the modifications of refiftance arfing ir mo the figure of the body. Thie mofk promment part of the prow changes the adticn if the fluid on the fucceeding farts, readering it totall different from what it wond be were that part detwhed from the reft, and capofed to the fleam with the fame obl cyity. It is of no confíquence, therctor:, to dedace :my tormula from the whable experiments of the Frenh anademy. The experiments thenfelves are of great impatal ce, becaute they give us the inpulfes on phate fertaces with
every obliquicy: They therefore put it in our power Rufinznee. to filea the mot proper obliqui:y in a thoutind im. portant cafcs. hy appealing to them, we can tell what is the proper angle of the fail for froducing the greaseft impulfe in the direction of the thip's coulse ; or the beff inclination of the fail of a wind-mill, or the beft inclination of the flont of a water.whesk, Sic. Sic. Thefe deductions will be mate in their proper places in the courfe of this work. We fee alfe, that the deviation from the fimple thensy is not very confiderable till the obliquity is great ; and that, in the inclinations which ohber circumitances would induce us to give to the flats of water-wheels, the fails of wind-mills, and the like, the refults of the theory are fufficiently agreeable to experiment, for rendering this theory of wery great ufe ia the conftruction of inachines. Its great defer is in the impulfions on curval furfaces, which puts a Atop to our improvement of the feience of naval architelture, and the working of hips.

But it is not enough to detect the faults of this theory: we thould try to anend it, or to fubltitute another. It is a pity that fo much ingenuity thould have been thrown away in the application of a theory fo defeetive. Mathematicians were feduced, as has been already obferved, by the opportunity which it gave for exercifing their calculus, which was anew thing at the time of publithing this theory. Newton faw clearly the defects of it, and makes no ufe of any part of it in his fubfequent difcuffions, and plainly has ufed it merely as an introduction, in order to give fome gene. ral motions in a fubject quite new, and to give a demonAration of one leading truth, vi\%, the propotionality of the impulions to the fquares of the velocitics. While we profefs the higheft refpect for the talents and labours of the great mathematicians who have followed Newton in this moll difficultrefearch, we cannot help being forry that fome of the greateft of them continued to attach themelves to a theny which he neglected, merely becaufc it afforded an opportunity of diflaying their profound knowledge of the new calculus, of which they were willing to alcribe the difcovery to Leibritz. It has been in a great meature owing to this that we have been fo late in difcovering our ignorance of the fubject. Newton had himfelf pointed out all the defeas Its ulfced of this theory; and he fet himfelf to voork to difcover pointedous another which flould be more conformable to the na- hy Newture of things, retaining only fuch deductions from the ${ }^{1}$ other as his great figaciey affured him would fand the teft of experiment. Even in this he feems to lave been millaken by bis foll wers. He retained the proportionality of the icfitance to the fquare of the velocity. This they have endeapoured to demonfrate in a manner conformable to Newton's deternination of the oblique impulfes of tuids; and under the cover of the agreement of this propulition with experiment, they introduced into mechanics a mode of expreflion, and even of conception, which is inconfitent with all accurate notions on thefe fubject. Newton's propolitinn was, that the motions communicated to the fluid, and thereFore the motions luft by the body, in equal times, were as the fquares of the whocitic ; and he ennecived thefe ats pr per meatures of the refiftunces. It is a mattor of experience, that the fortes or preflures by which a body mut be fupporicd in oppolition to the impulf.s of fluids, are in this very propotion. In detarmining the
proporition of the direct and oblinue refitances of plane furfaces, he conficters the reflitances to arife fiom inutual collifions of the furface and fluid, repeated at intervals of time too finall to be perceived. But in making this compurifon, he has no occalion whatever to co:tider this repetition; and when he afligns the proportion between the reliftance of a cone and of its bale, he, in fact, alligns the proportion between two fimultancous and infantaneous impulfes. But the mathenaticians who followed him have confidered this repetition as equivalent to an augnontation of the initial or firt impulic; and in this way have attempted to demonftrate that the refiltan:es are as the fquares of the velccities. When the velocity is double, each impulse is double, and the number in a given time is duvble; therefore, fay they, the refiltance, and the force which will withfiand it, is quadruple; and obfervation confirms their deduction : yet nothing is more gratuitous and illogical. It is very true, that the reliftance, conceived as Newton conceives it, the lois of motion futzined by a body moving in the fuid, is quadruple ; but the inftantaneous impulfe, and the force which can withtand it, is, by all the laws of mechanics, only double. What is
the force, which can withtand a double impulfe? Nothing but a double impulfe. Nothing but impulfe can be oppofed to impulfe; and it is a grofs milconception to think of fating any kind of conparifon between impulfe and preffure. It is this which has given rife to
much jargon and falfe reafoning about the force of percufion. This is fated as infinitely greater than any preflure, and as equivalent to a preflure infinitely repeated. It forced the abettors of thefe doEtrines at laft to deny the exitence of all prefures whatever, and to affert that all motion, and tendency to motion, was the refult of impulfe. The celebrated Euler, perhaps the firit mathematician, and the loweft philofopher, of this century, fays, "fince motion and impulfe are feen to exilt, and fince we fee that by means of motion preffure niay be produced, as when a body in motion frikes annther, or at when a body moving in a curved channel prefies upon it, merely in confequence of its curvilineal moction, and the exertion of a centrifugal force; and fince Nature is mof wifly economical in all her operations; it is abfird to fuppofe that preffure, or tendency to motion, has any other origin; and it is the bufinefs of a philofopher to difcover by what motions any obeterved preffure is produced." Whenever any preflure is obferved, fuch as the preffure of gravity, of magnetifm, of elearicity, of condenfed air, nay, of a fpring, and of elaficity and cohefion thempelves, however defperate, nay, oppufite, the philofopher muft immediately calt about, and contrive at fet of motions (creating pro re ant the movers) which will produce a preflure like the one obferved. Having pleated his fancy with this, he crie, out iofnxa "this wiol produce the prefifure;" et frufra fit fer thara quod ficri potef per pauciora, "theretore in this way the prollure is produced." Thus the vorices of Defartes are brought back in triumph, and have predeced vortices "ithnut number, which fill the univerie with motion and preffure.
such bold attempts to overturn long-received doctrines in mechan:rs, could not be rceeived without much criticifm and oppofition; and many able diflertations appeared from time to tine in delence of the conmon docirines. In confequence of the many objections to Vol. XVI.

103
R E S
the comarifun of pere prefure with pure percufion Refinarece or impulfe, John Bern ulli and others were at laft obliged to aftert that there were no perfealy hard bodies in nature, nor could be, but that all bodies were claftic; and that in the communication of motion by percuftion, the relocities of both bodies were gradually changed by their mutual elaficity afting dusing the finite but imperceptible tinie of the collifion. This was, in fact, giving up the whole argument, and banifhing percul: fion, while their aim was to gret rid of preffure. For what is elafticity but a preffure? and how fhall it be produced? To act in this inftance, inuft it arife from a itill fmaller impulie? But this will require ancther elaflicity, and fo on without end.
Thefe are all lesitimate confequences of this attemp: to flate a comparifon between percuflion and prefure. Numberlefs experiments have been made to confirm the fatement; and there is hardly an itinerant-lecturing thowman who does not exhibit among his apparatus Gravefand's machine (Vol. I. piate xxxv. fig. 4). But nothing affurds fo (pecious an argument as the experimented proportionality of the impulfe of fluids to the fquate of the velocity. Here is every appearance of the accumulation of an infinity of minute impulfes, in the known ratio of the velocity, each to each, producing preffures which are in the ratio of the fquares of the velocities.
The preflures are obferved; but the impulfes or percuffions, whofe accumulation produces thefe prefures, are only fuppofed. The rare fluid, introduced by New. ton for the purpofe already mentioned, either does not exift in nature, or does not aft in the manner we have faid, the particles making their impulie, and then efcaping through among the reft without affecting their mo. tion. We cannot indeed fay what may be the proportion betiween the diameter and the diftance of the particles. The firt may be incomparably fmaller than the fecond, even in mercury, the denfeft fluid which we are familiarly acquainted with; but although they do not touch each other, they ad nearly as if they did, in confequence of their mutual attractions and repulions. We liave feen air a thoufand times rarer in fome experiments than in others, and therefore the diftince of the particles at leaft ten times greater than their diameters ; and yet, in this rare flate, it propagates all preffures or impulies made on any part of it to a great diftance, almoft in an inftant. It cannot he, therefore, that fluids aft on bodies by impulfe. It is very poffible to conceive a fluid advancing with a flat furface againft the flat furlace of a folid. The very firlt and fuperficial particles nay make an impulfe; and if they were annibilated, the next might do the fame: and if the velocity were double, thefe impulies would be double, and would be withitood by a double force, and not a 'quadruple, as is obterved : and this very circumpance, that a quasdruple force is necelfiry, thould lave made us conclude that it was not to impulfe that this force was oppofed. The firlt particles having made their floke, and root being annihilated, muft ectape literally. In their efcaping, they effefually prevent every farther impulfe, becaule they come in the way of thof fimall put becaute they come in the way of thofe filaments which of a fluid would have ftruck the body. Thie whole procefs feems can nalke to be fomen hat as follows:

When the flat furlace of the fluid has come into con- purfe on 2 tact with the plane furface AD (fig. 6.), perpendicular furface.

In fitaree. to the direstion DC of their motion, they mat defter to both fudes equally, abd ia eq.at po: pinns, becaule no reaton can be alligned why mare humbdgo to either lide. By thi; means the lihment Eli, whath would Raseftrinch the lintice in 6 , is de.iested hegore '* arrives . a the furlace, and deforibes a curved proth E! I HK, cuntinuing its ralitineal moriva to $I$, where it is intercepted by a flammon inmediately adjoming to EF , on the li.le of the middle li.amear DC. The cutterent paric! - of 1) C mil be fuppores to mpinge in tuccellion at $(\mathcal{L}$, a 21 to be deflefted at arht angles; and gliding alung ClB, :0 ediape at B. Ench flament in fuecefion, outwitds from DC, is denected in its turn; and being lindered from even tonching the furtace $C B$, it glides off in a dirction parallel to it; and thas EF is deflected in I, moves pasallel to CB from I to H , and is again delleded at right angles, and defcribes HK parallel to DC. The foine thing may be ruppofed to happen on the ther fiue of DC.

And thus it would appear that except two filaments immediately adjoining to the line DC , which bifects the furface at right angles, no part of the fluid makes n. 2 impulfe on the furface $A B$. All the other filaments ate merely preffed againt it by the lateral filaments without them, which theyturn alide, and prevent from

In lik: manner, when the Ruid firikes the edge of a Noimpulfe prifm or wedge $A C B$ (fig. 7.), it cammot be faid that on the edze any scal impulfe is made. Nothing hinders us from - a prifne fuppofing C a mathematical angle or indivilible point, not fufeeptible of any impulfe, and ferving merely to divide the fleam. Each filament EF is ettectually provented from impinging at $G$ in the line of its direction, and with the obliquity of incidence EGC, by the flaments between EF and DC , which glide along the furface C.A; and it may be fuppofed to be delleced when it comes to the line CF which bifects the angle DCA, and arain deflected and rendered parallel to DC at I. The fame thing happens on the other fide of $D C$; and we cannot in this cafe alfert that there is any impulfe.

We now fee plainly how the ordinary theory mult be totally unfit for furnilhing principles of naval architecture even althougl, a fermula could be deduced from fuch a feries of experiments as thofe of the French Academy. Alchough we flould know preciely the impulfe, or, to fpeak now morc cantioully, the action of the fluid on a furface GL (fig. S.) of any obliquity, when it is alnne, detached from all others, we cannot in the fmalleft degree tell what will be the action of part of a fream of Auid advancing towards it, with the fame obliquity, when it is preceded by an adjoining furface CG, having a different inclination; for the fluid will not glide along GL in the fame manner as if it made part of a more extenfive furface having the fame inclination. The previous deflections are extremely different in thefe two cafes; and the previous deflections are the only changes which we can obferve in the motions of the fluid, and the only caufes of that preflure which we obferve the body to fultain, and which we call the impulfe on it. This theory muft, therefore, be quite unft for afcertaining the adion on a curved furface, which may be conlidered as made up of an indefivite number of fuccelfive planes.

We now fee with equal evidence how it happens that
the action of lluids on folid bodies may and mut be op- Relinanse. p led by preflires, and may be compared with and meat liured by the pretlute of gravity. Wre are not compat-Prefure, ring forces of different kinds, percullions with prehiares, the achion but prefluses with each other. Lat us fee whether of duids this view of the fubject will atrend us any method of comprifon or ablolute meafurement.

When a filament of fluid, that is, a row of corpufeles, are turned nut of their couric E.F (fig. G.), and lorced to take another courde IH , force is required to produce this change of diredion. The filament is prevented from procecding by other filaments which lie between it and the body, :und which defleet it in the fame manner as if it were contatined in a bended tube, and it will prefs on the concave filament next to it as it would prefs on the concave fide of the tube. Suppofe fuch a bended tube ABE (lig. 9.), and that a ball $A$ is projected along it with any velucity, and moves in it without lric. tion : it is demonftrated, in elementary mechanics, that the ball will move with undiminifhed velocity, and will prels on every point, fuch as $B$, of the concave fide of the tube, in a dirction BF perpendiculan to the plane CB1), which touches the tube in the point B. This prelfare on the idjoining filament, on the colicave fide of its path, muft be withtood by that filament which deflects it; and it mut be propagated acrofs that filament to the next, and thus angment the preffure upon the next filament already prelfed by the deflection of that intormediate filament; and thus there is a preffure towards the middle filament, and towards the body, arifing from the deflection of all the outer filaments; and their aceumulated fum mult be conceived as immediately exerted on the middle flaments and on the body, becaufe a perfect fluid tranimits every prelfure undiminifhed.

The preffure BF is equivalent to the two $\mathrm{BH}, \mathrm{BG}$ one of which is perpendicular, and the other parallel, to the direction of the original motion. By the firf, (taken in any point of the curvilineal motion of any filament), the two halves of the ftream are preffed together; and in the cafe of fig. 6. and 7 . exactly balance each other. But the preflures, fuch as BG, mult be ultimately withftood by the furface ACB ; and it is by thefe accumulated preflures that the folid body is urged down the ftream ; and it is thefe accumulated preffures which we obferve and meafure in our experiments. We fhall anticipate a little, and fay that it is moft eafily demonftrated, that when a ball A (fig. 9.) moves with undiminifhed velocity in a tube fo incurvated that its axis at $E$ is at right angles to its axis at $A$, the accumulated action of the preflures, fuch as BG, taken for cevery point of the path, is precifely equal to the force which would produce or extinguifh the original motion.

This being the cale, it follows molt obvionfly, that if the two motions of the filaments are fuch as we have defcribed :ind reprefented by fig. 6 . the whole prefture in the direction of the ftream, that is, the whole preflure which whether can be obferved on the furface, is equal to the weight of a they be column of Hluid having the furface for its bafe, and twice elanic or the fall productive of the velocity for its height, pre- ${ }^{-110 t}$. cifely as Newton deduced it from other confiderations; and it feems to make no odds whether the fluid be elaftic or unelaftic, if the deflections and velocities are the fame. Now it is a fant, that no difference in this refpect
$\underbrace{\text { Refitance. }}$ fpeat can be obfelved in the actions of air and water; and this had always appeared a great defect in Newton's theory : but it was only a defect of the theory attributed to him. But it is alfo true, that the obferved action is but one-half of what is juft now deduced from this improved view of the fubject. Whence anifes this difference? The reafon is this: We have given a very crroneous account of the motions of the filaments. A filament EF does not move as reprefented in fig. 6. with two rect:agular inflections at I and at H , and a path IH between them parallel to CB. The procefs of nature is more like what is reprefented in fig. 10. It is obferved, that at the anterior part of the body A. , there remains a quantity of fluid ADB , almoft, if not altogether, Aagnant, of a fingular fhape, having two curved concave fides $\mathrm{A} a \mathrm{D}, \mathrm{B} \ell \mathrm{D}$, along which the middle filaments glide. This fluid is very flowly changed.The late Sir Charles Knowles, an officer of the Britifh navy, equally eminent for his fcientific profeffional knowledge and for his military talents, made many beautiful experiments for afcertaining the paths of the filaments of water. At a diftance up the fream, he allowed fmall jets of a coloured fluid, which did not mix with water, to make part of the fream; and the experiments were made in troughs with fides and bottom of plate-glafs. A fmall taper was placed at a confiderable height above, by which the fhaldows of the coloured filaments were moft diftinetly projefied on a white plane held below the trough, fo that they were accurately drawn with a pencil. A few important particulars may be here mentioned.

The fill water ADC lated for a long while before it was renewed; and it feemed to be gradually walted by abrafion, by the adhefion of the furrounding water, which gradually licked away the outer parts from D to A and B ; and it feemed to renew itfelf in the direstion CD, oppofite to the motion of the Aream.

There was, however, a confiderable intricacy and eddy in this motion. Some (feemingly fuperficial) water was continually, but flowly, flowing outward from the line $D C$, while other water was feen within and below it, coming inwards and going backwards.

The coloured lateral filaments were moft confant in their form, while the body was the fame, although the velocity was in fome cafes quadrupled. Any clange which this produced feemed confined to the fuperficial filaments. As the filaments were deflefted, they were alfo conflipated, that is, the curved parts of the filaments were nearer each other than the parallel ttraight filaments up the ftream ; and this conftipation was more confiderable as the prow was more obtufe and the defection greater.

The inner filaments were ultimately more defected than thofe without them; that is, if a line be duawn touching the curve EFIH in the point H of contrary flesure, where the concavity hegins to be on the fide next the body, the angle HKC , contained between the axis and this tangent line, is fo much the greater as the filament is nearer the axis.

When the body expofed to the fream was a box of upright fides, flat bottom, and angular prow, like a wedge, having its edge alfo upright, the filaments were not all deflected laterally, as theory would make us expeft; but the filaments near the bottom were alfo deflefted downwards as well as laterally, and glided along
at fome difance under the bottom, forming lines of iefintuece
double curvaturc.
The breadth of the fream that was defletted was much greater than that of the body ; and the fenfible deflestion begun at a confiderable diftance up the ftream, efpecially in the outer filaments.

Laftly, the form of the curves was greatly influenced! by the proportion between the width of the trough and that of the body. The curvature was always lefs when the trough wa:s very wide in proportion to the body.
Great varieties were alfo offerved in the motion or velocity of the filaments. In general, the filaments increafed in velocity outwards from the body to a certain fmall diftance, which was nearly the fame in all cafer, and then diminifhed all the way outward. This was obferved by inequalities in the colour of the filaments, by which one could be obferved to outtfrip another. The retardation of thofe next the bedyfeemed to proceed from friction; and it was imagined that vrithou: this the velocity there would always have been greateft.
Thefe obfervations give us coniderable information with ${ }^{43}$ refpecting the mechanifm of thefe motions, and the ac- reucesfroa tion of fluids upon folids. The preffure in the duplicate then. ratio of the velocities comes here again into view. We found, that although the velocities were very diferent, the curves were precifely the fame. Now the obferved preflures arife from the tranfverfe forces by which each particle of a flament is retained in its curvilineal path; and we know that the force by which a body is retained in any curve is directly as the fquare of the velocity, and inverfely as the radius of curvature. The curvature, therefore, remaining the fame, the tranfverfe forces, and confequently the preffure on the body, mult be as the fquare of the velocity: and, on the other hand, we can fee pretty clearly (indeed it is rigorounly demonfrated by D'Alembert), that whateverbe the velocities, the curves will be the fame. For it is known in hydraulics, that it requires a fourfold or ninefold preffure to produce a double or triple velocity. And as all preffires are propagated through a perfect fluid without diminution, this fourfold preffure, while it produces a double velocity, produces alfo fourfold tranfverfe preffures, which will retain the particles, moving twice as faft, in the fame curvilineal paths. And thus we fee that the impulfes, as they are called, and refiftances of fuids, have a certain relation to the weight of a column of fluid, whofe height is the height neceffary for producing the velocity. How it happens that a plane furface, immerfed in an extended fluid, fuftains jut half the preffure which it would have futtained had the motions been fich as are iketched in figure 6 h , is a matter of more curinus and difficult inveftyration. But we fee evidently that the preffure mult be lefs than what is there affigned; for the flagnant water a-head of the body greatly diminifhes the ultimate defections of the filaments: And it may be demonftrated, that when the part BE of the canal, fig. 9 . is inclined to the part $A B$ in an angle lefs than $90^{\circ}$, the preffures BG along the whole canal are as the verfed fine of the ultimate angle of deflection, or the verfed fine of the angle which the part BE makes with the part AB. Therefore, fince the deflections refemble more the fketch given in fig. 10 . the accumulated fum of all thefe forces BG of fig. 9. mult be lefs than the fimilar fum correfponding to fig. 6. that is, lefs than

R-inauce the weight of the column of rioht, having twice tlee prozuclive height for its heiglit. Jow it is jutt onehalf, tha'l be our next inguis).

Andlese we mult recurn to :lie lat ours of Sir Itace Newton. Alter manyleataful fefernations on the nasure and mechanim of contastaed thids, he fịs, that the relittance whichthoc; ocestic n! is but oacehat of that occalinned by the tave fitad which had been the forjoet of his former propntit on ; "which rath," (fiys lic.
 ts lisow."

He then enters into another, å novel and on dithenit
 bous to afertain the mot on of thins though oritices wien urged by prellures of anty kind. He endeavours t) aliertain the velocity wath vhich a fluid c'capes thround a lomiontal milice in the bntom of a vellis, bs the attion of its weishe, and the profluae which dis vein of Aud wial cxert ona little circle which occupies part of the osifice. T'o ribtain this, lee employs at had of arproximatson and trial, of which it would be extremely difficult th give an extrad ; and then, by increafing the diameter of the veffel and of the hole to infinity, he accommodates his reafoning to the cate of a plane firface expoted to an indefinitely extented fream of 1lud; and lafty, giving to the little circular furface the motion which he had before alicribed to the fluit, he foys, that the refitance to a plame furface moving threwin an unelaftic continumus fuid, is equal to the wight of a column of the fluid whofe height is onehalf of that neceffary for acquiring the velocity ; and he litys, that the refiftance of a globe is, in this cale, the fame with that of a cylinder of the fame diameter. The refiftance, tl:ereforc, of the cylinder or circle is four times lefs, and that of the globe is twice lefs than their refiflances on a rare elatic medium.

But this determination, though founded on princi. ples or affumptions, which are much nearer to the real fate of things, is liable to great objections. It depends on his methad for afcertaining the velocity of the iffing fluid; a meihod extremely ingenious, but d. icetive. The catarat, which he luppofes, cannot exift as he fuppofes, defiending by the full action of $\because$ ravity, ard fu:rcunded by it funnel of nagnant fluid. For, in fuch circumfance:, there is nothing to balance the hystrofatical pretfure of this furrounding tuid; be. caufe the whols preflure of the centall catarant is employed in producing its uwn defent. In the next place, the preffure which he determines is beyond all loubt onls hatf of what is obterved on at plane futface in all our experimerts. And, in the third place, it is repugnant to all our cxperience, that the refitance of a globe or of a printed body is as great as that of its circular batc. His rcations are by no means convincing. Me fuppofes them phaced in at lube or canal ; and fince they ate iuppofed of the fume dimeter, and therefore leave equal tpaces at their lides, he concludes, that becauf: the water cieajes by their lides with the fanso ve. locity, they will have the fime reffance. But this is by no means a necelliry comequence. Even if the water thould be allowed to exert equal frefures on them, the preflires being perpendicular to their furBaces, and thefe furfaces being inclined to the axis, while in the cate of the bate of a cylinter it is in ite dirention of the axis, there muft be a difference in
tle accumuiated or compund prellite in the dircétion Refinance. o: the:asis. Ile indeed fias s, that in the cafe of the cyinder or the circle oblimating the camal, a quantity of water temains daynam on its upper fistive; vi\%. all the water whote motion would not contribute 10 the mon reat? patatge of the thid between the cyliador and the fises of the catnal or tube; and that this water mary be confidered as fromen. There remuirs, :hercfore, many imperfections in this Though theory. But notwihbunding there deteds, we canmot difplaying but admire the effirts and fagacity of this great phi. great fagsInfophor, wlob, afer having difocered fo many fublime truths of mechanical sature, ventured to trace out at path for the fislusion of a problem which no perfon had yet attempted to bring within the range of mathematical inveltigation. And his folution, though inaccurate, fhines throughout with that inventire genius and that fertility of refoures, which no man ever porfeffed in fo eminent a degree.

Tho who have attacked the folution of Sir Iface Newton have not been more fuccefful. Mont of them, intlead of principles, have given a great deal of catculus; and the chicf merit which any of them c:at claim, is that (f) having deduced fome lingle propolition which happens to quadrate with fome fingle calle of experiment, while their general theories are either inapplicable, from difieulty, and obfcurity, or are difcorctant with more general obfervation.

We muft, however, except from this number Danicl Bernonlli, who was not only a great geometer, hut one of the firt plilofophers of the agge. He polfeffed all the talents, and was free from the faults of that celebrated family; and while he was the mathematician of Enrope who penetrated farthelt in the inveftigition of this great problem, he was the only perfon who felt, or at leaf who acknowledged, its great diffienlty.

In the 2 d rolume of the Comment. Petropol. 1727, he probofes a lormula for the refillance of fluids, de-
duced irum conliderations quite different from thofe on which Newton founded his folution. But he delivers it with modeft diffidence; becaufi he found that it gave a refflance fous times grcater than experiment. In the fame differtation be determines the reliftance of a fphere In be one laalf of that of its great ciecle. But in his fuhfeguent theory of Hydrodynamics (a work which mult ever rank among the firft productions of the age, and is equably eminent for refined and eleg:nt mathematics, and ingenious and original thoughts in dynamics), he calls this determination in queltion. It is indeed founded on the firme hypotherical principles which have been unfiliully detached from the relt of Ncwiton's phyfics, and mate the ground-work of all the fubfequent theories on this fubjeet.

In 1741 Mr Daniel Bernoulli publifhed another dif-
Estation

Refitance, fertation (in the $8: h$ volume of the Coin. Pctropol.)

## 50

He ireats the fubjea in a particularcale with great precifion. on the action and reffefance of fluids, limited to a very particular cafe; namely, to the impulfe of a vein of fluid falling perpendicularly on an insinitely extended plane furface. This he demonftates to be equal to the weight of a column of the fluid whofe bufe is the area of the vein, and whofe height is twice the fall producing the velocity. This demonflation is drawis from the true principles of mechanies and the acknowledged haws of hydraulics, and may be received as a Atrict phyfical demonftration. As it is the only propotition in the whole theory that has as yet reccived a demonftration accellible to readers not verfant in all the refinement of modern analyfs; and as the principles on which it proceads will chdoubsedly lead to a folution of every problem which can be plopofed, once that our mathematical knowledge thall enable us to apply thatn-we think it our duty to give it in this place, although we mut acknowledge, that this probiem is fo very limited, that it will hardly bear an application to any cate that diffeis but a little from the exprefs conditions of the problem. These do occur cafes hoveever in practice, where it may be applied to very great advantage.

Danel Bemoulli gives two demonftrations; one of which may be called a popular one, and the other is more fcientific and introductory to Euther inveltieation. We fhall give both.

Bernoulli fir!t determines the whole action exerted in the efllux of the vein of Huid. Suppofe the velocity of effux $v$ is that which would be acquired by faling through the height $h$. It is well known that a body moving duting the time of this fall with the velocity $v$ would defcribe a face 2 b . The cffect, therefore, of the hydraulic action is, that in the time $t$ of the fall $h$, there iffues a cylinder or prifm of water whole bafe is the crofs fection for are.t of the vein, and whofe length is $2 \%$. And this quantity of matter is now moving with the velocity $v$. The quantity of motion, therefore, Which is thus produced is $2 s b v$; and this quantity of motion is produced in the time $t$. And this is the accumulated effect of all the expelling forces, eftimated in the diection of the efllux. Now, to compare this with the exertion of fome preffing power with which we are familiarly acquainted, let us fuppofe this pillar $2 s h$ to befrozen, and, being held in the hand, to be dropped. It is well known, that in the time $t$ it will fall through the beight $h$, atd will acquire the velocity $\theta$, and now polfefles the quantity of motion 2 sbv and all this is the effect of its weight. The weight, therefore, of the pillar $2 \mathrm{~s} b$ produces the fiame effeet, and in the fame time, and (as may eafily be feen) in the fame gradual mauner, with the expelling forces of the fluid in the veifel, which expclling forces arife from the prefure of all the fluid in the velfel. Therefore the accumulated hydraulic preffure, by which a vein of a heavy fluid is forced out through an orifice in the bottom or lide of a reffel, is equal (when eftimated in the direction of the efflux) to the weight of a column of the fluid, baving for its bate the fection of the vein, and twice the fall productive of the velocity of efflux for its height.
Plate Now let $A B D C$ (fig. 11.) be a quadrangular veffel eccoxxavi. with upright plane dides, in one of which is an orifice EF. Erom erery point of the circumference of this
orifice, fuppofe jucrizontal lines Ee, Ef, Se, which wi.lRefinance. marl: in fimilar furface on the oppofite fide of the veilel. Suppofe the orifice EF to be thut. There can be :on donbt bu: that the furfaces EF and ef will be equally prefled in uppofite directions. Now open the orifice EF; the water will rufh out, and the preffure on EF is now removed. There will therefore be a tenderic: in the velfel to move back in the direction Ee. And this tendency muf be precifely equal and oppofite to the whole effort of the expelling forces. This is a conclufinn as ovident as any propotition in mecharics. It is thus that a gun recoils and a rocket rifes in the air; and on this is founded the operation of Mr Parents or Dr Barker's mill, deferibed in all treatifes of mechanics, and mof learnedly treated by Euler in the Berlin Memoirs.

Now, let this fream of water be received on a circular plane MV, perpendicular to its axis, and let this circular plane be of fuch extent, that the veir efeapes from its fides in an infinitely thin theet, the water flow. ing off in a direction parallel to the plane. The veir by this means will expand into a trunpet life thitpe, having curved lides, EKG, FIH. We abtract at prefent the ation of gravity, which wonld caute the rein to bend downwards, and nccafien a \%rater velocity at H than at G ; and we fuppofe the velncity equal in every point of the circumterence. It is plain, that if the action of gravity be nerglected after the water has illued through the orifice EF, the velocity in every point of the circumlerence of the plane MN will be that of the efflux through EF.

Now, becaufe EKG is the natural frape affumed by the vein, it is plain, that if the whole vein were covered by a tube or mouth piece, fitted to its fhape, and perfectly polithed, fo that the water thall glide along it, without any friction (a thing which we may always fuppole), the water will exert no preflure whatever on this trumpet mouth-piece. Laftly, let us fuppofe that the plane MN is attached to the mouth-picce by fome bits of wire, fo as to allow the water to efcape all rommd by the narrow chink between the mouth-piece and the plane: We have now a veffel confiting of the upright part ABDC, the trumpet GKEFLH, and the plane MN; and the water is efcaping from every point of the circumference of the chink GHNM with the relocity v. If any part of this chink were fhut up, there would be a preffure on that part equivalent to the force of efflux trom the oppofite part. Therefore, when all is open, thefe elforts of eflux balance cach other all round. There is not therefore any tendency in this compound velfel to move to any fide. But take away the planc MN, and there would immediately aide a preffure in the direction $\mathrm{E} e$ equal to the weiglit of the columm $25 \%$. This is therefore halanced by the prefiure on the circular plane $M \mathrm{~N}$, which is therefcre cqual to this weight, :nd the propofition is demonfrated.

A number of experiments were made by Profeffor Kraft at St Peterburg, by receiving the vein on a plane MN (fig. II.) which was faflened to the arm of a b.llance OPQ, laving a fate $R$ hanging on the oppotite arm. The refitance or preflire on the plane wis me:tfured by weights put into the fiale K ; and the veloci:y of the jet w:as meafured by means of the clifance 1 H , to which it frouted on an horizcata! p? tue.
$\because \quad \therefore \cdots$. - irroue 1 :rwern $1^{\circ}$ ithery Hesper 11. .....ee unted [11.
$\because \because . \therefore \quad \therefore \quad \because$ de expenimen's were no ennfurmable 1) 1.2 : $1:$ अr as cald be withed. 'Ihe rifathance was
 $\therefore$ ratio ereced. 3 its halt ; the refult of the general receised tuconis. 'I his defeet flould lee eapected; fur the demer:t de on fuppores the flane MN to he infniteIr enterded, su that the film of witer which iffues thranot the chank may be acouritely parallel to the p'anc. 'llhis never can be comp'etely etfectod. Alou it was fuppofed, that the vele city was jufly meafured by the amplituse of the puabola EGK. But it is well known that the very putting the plane MN in the way of the jet, though at the dittance of an inch from the urifice, will diminith the velocity of the eflex through t! is citice. "This is cafily verified by experiment. Obferve the time in which the velfel will be empried when there is noplane in the way. Repeat the experiment with the plate in its place ; and more time will be ncceltary. The following is a note of a courle of experiments, taken as they dand, without any iclection. $\begin{array}{lcccccc} & N^{2} 1 & 2 & 3 & 4 & 5 & 6 \\ \text { Refin. by thenry } & 1=01 & 1720 & 1651 & 1602 & 1528 & 1072 \\ \text { ReGit. by experiment } & \frac{1403}{298} & \frac{1+63}{257} & \frac{1486}{165} & \frac{1401}{201} & \frac{1403}{125} & \frac{1021}{51} \\ \text { Difference } & \end{array}$

In order:odemonftrate this propotition in fuchamanner as to furnith the means of inveltigating the whole mechanifm and action of moving fluids, it is neceffary to premide an elementary theorem of curvilincal motions.

It a particle of matter defcribes a curve line ABCE
(fig. 13.) by the comsinual action of defleating forces, which vary in any manner, both with refpect in intenfity and direction, and if the action of thefe forces, in every point of the curve, be refolved into two directions, perpeadicular and parallel to the initial direction Ak; then,

1. The accumulated effect of the defeging forces, eftimated in a direction $A D$ perpendicular to $A K$, is to the final quantity of motion as the line of the final change of direction is to radius.

Let us firt luppofe that the accelerating forces act by Alarts, at equal intervals of time, when the body is in the points $A, B, C, E$. And let $A N$ be the defleating force, which, aling at A, chanmes the original dirction AK to AB . Produce AB till $\mathrm{BH}=$ A 13 , and complcte the parallelogram 13 FCH . Then IB is the force which, by acting at 13 , changed the motion BH (the continuation of AB ) to liC. In hake manner make Cb (in BC produced) equal to BC, and complete the parallelegram CfEh. Of is the deffecting force at $\mathrm{C}, \mathcal{\&}$. Draw BO parallel to $\Lambda \mathrm{N}$, and GBli perpendicular to AK. Alfo draw lines through C and E perpendicular to AK, and draw through B and C lines parallel to AK . Draw alfo HL, bi perpendicular, and I'G, HI, hi, parallel to AK.

It is plain that lik is BO or AN ellimated in the direaion perpendicular to AK, and that BG is BF eftimated in the fame wray. And tince $13 \mathrm{H}=\mathrm{AD}, \mathrm{HI}$. ir IM is cqual to BK. Alio CI is cqual to BG . Therefere C II is equal to AP $+B G$. By fimilar reafoning it appars that $\mathcal{L i n}_{n}=\mathrm{E} i+h i=\mathrm{C} g+\mathrm{CM},=$ $C_{3}+B,+A P$.

Therctore it CE be taken for the meafure of the final vel city or quantity of motion, Em will be the accumalated effer of the deflecting forecs eltimated in the dircation A1) perpendicular to AK. But Em is
to CE: as the fone of mCE is io radit: ; and the angle Refimance 1. CE is the angle contained between the initial and final dircetions, becaufe $\mathrm{C} m$ is parallel to Ah. Now let the intervals of time diminif continually and the freguancy of the impulies increate. The detlection becomes uhtmitely continuous, and the motion curviliweal, and the propolition is denmontrated.

We fee that the initial velocity and its fubfequene clanges do not affer the conclution, which depends cutirely on the final quamity of motion.
2. The accumulated eficet of the accelerating forecs, when eltimated in the direetion AK of the originat motion, or in the oppofite dirction, is equal to the difference between the initial quantity of motion and the produt of the final quantity of motion by the cofine of the change of direction.

$$
\begin{aligned}
\text { For } \mathrm{C} n & =\mathrm{C} i-m l, \\
\mathrm{BM} & =\mathrm{BL}-\mathrm{BL}-\mathrm{fL}, \\
\mathrm{AK} & =\mathrm{AO}-\mathrm{OK},
\end{aligned}=\mathrm{AO} \mathrm{O} \mathrm{PN} .
$$

Therefore PN + FG + C (the aecomulated impulfe in the direstion $O A)=A O-C M,=A O-C \overline{E \times C O}$ fine of ECM .

Cor. 1. The fame aftion, in the direction oppolite to that of the original motion, is neceffary for caufing a body to move at right angles to its former direction as for Atoping its motion. For in this cafe, the cofine of the change of direation is $=0$, and $A O-C E$ $X$ cofine $E C M=A O-0,=A O,=$ the original motion.

Cor. 2. If the initial and final velocities are the lame, the accumulated attion of the accelerating forces, eftimated in the dredion OA, is equal to the produrt of the original quantity of motion by the veried fune of the change of direction.

The application of thefe theorems, particularly the fecond, to our prefent purpofe is very obvinus. All the filaments of the jet were originally moving in the direction of its axis, and they are firally moving along the refifing plane, or perpendicular to their former motion. Thercfore their tranfverfe forces in the dirention of the axis are (in cumu'o) equal to to the force which would fop the motion. For the aggregete of the fimultanoous forces of every particle in the whole filament is the fame with that of the fucceffive forces of one particle, ats it arrives at different points of its curvilineal path. All the tranfverfe forces, eftimated in a direction perpendicular to the axis of the vein, precifely balance and fultain each other; and the only forces which can produce a fenfible effect are thole in a direction paralled to the axis. By thefe all the imner flaments are preffed towards the plane $\operatorname{IIN}$, and muft be withfood by it. It is highly probable, nay certuin, that there is a quantity of tagnant water in the middle of the vein which futtains the preflures of the maving bilaments without it, and tranfmits it to the folid plane. But this does not alter the cafe. And, fortumately, it is of no confequence what changes happen in the velocities of the particles while each is defcribing its own curve. And it is from this circumttance, peculiar to this particular cafe of perpendicular impulfe, that we are able to draw the conclution. It is by no means difficult to demonftrate that the velocity of the cxternal furface of this jet is confant, and indeed of every jet which is not acted on by external forces after it has quitted the orifice: but this difcuffion is quite unneceffary here. It is however extremely difficult to afcertain, even in this mon limple

## R ES

Refifance. cafe, what is the velocity of the interna! filamerts in the diffcrent points of their progrefs.

Such is the demonfration which Mr Barnculli lias given of this propofition. Lemited as it is, it is highly valuable, becaute dcrived from the true principles of hydraulics.

He hoped to render it more extenfive and applicable to oblique impulfes, when the axis $A C$ of the vein (fig. 13. $\mathrm{n}^{\circ}$ 2.) is inclined to the piane in an angle ACN . But here all the fimplicity of the cafe is gone,
and we are now obliged to atcertain the motion of each filament. It might not perhaps be impollible to determine what muft happen in the plane of the figure, that is, in a plane palling inrough the axis of the vein, and perpendicular tr the plane MN. But even in this cafe it would be extremely difficult to determine how much of the fluid will go in the direation EKG, and what will go in the parh FLH, and to afcertain the form of each filameut, and the velocity in its different pninis. But in the real flate of the cafe, the water will diffipate from the centre C on every fide; and we cannot tell in what proportions. Let us however confider a little what happens in the plane of the figure, and fuppofe that all the water goes either in the courfe EKG, or in the courfe FL.F. Let the quantitics of water which take thefe two courfes have the proportions of $p$ and $\pi$. Let $\sqrt{2 a}$ be the velocity at $A$, $\sqrt{2 \bar{l}}$ be the velocity at $G$, and $\sqrt{23}$ be the velocity at H. ACG and ACH are the two changes of direction, of which let $c$ and $-c$ be the colines. Then, adopting the former reafoning, we have the preflure of the watery plate GKEACM on the plane in the direction $A C=\frac{p}{p+\pi} \overline{\times 2 a-2 c b}$, and the preffure of the plate HLFACN $=\frac{\pi}{\frac{p+\pi}{2 a}+\overline{2 c \beta} \text {, and their fum }}$ $=\frac{p \times \overline{2 a-2 c b}+\pi \times 2 a+2 c \beta}{p+\pi}$; which being multiplied by the fine of ACM or $\sqrt{1-c^{2}}$, gives the preffure per-
pendicular to the plane $\mathrm{MN}=\$ \times 2 a-2 c b+\pi \times \frac{2 a}{2 a-2}$ pendicular to the plane $\mathrm{MN}=\frac{p \times 2 a-2 c b+\pi \times 2 a}{p+\pi}$ $\overline{+2 c^{3}} \sqrt{1-c^{2}}$.
But there remains a preflure in the direction perpendicular to the axis of the vein, which is not balanced, as in the former cafe, by the equality on oppolite fides of the azis. The preffure arifing from the water which efcapes at $G$ has an effect oppofite to that produced by the water which efcapes at H. When this is taken into account, we fhall find that their joint efforts perpendicular to ACare $\frac{p-11}{p+\pi} \times 2 a \sqrt{1-c^{2}}$, which, being multiplied by the cofine of ACM , gives the action perpendicular to $M N=\frac{p-\Pi}{p+\pi} \times z a c \sqrt{1-c^{2}}$.

The fum or joint effort of all thefe prefures is $\frac{p \times \overline{2 a-2 c b}+\Pi \times-\frac{}{2 a+2 c b}}{p+\Pi} \sqrt{1-c^{2}}+\frac{p-\Pi}{p+\Pi} \times 2 a c \sqrt{1-c^{2}}$.

Thus, from this cafe, which is much fimpler than can happen in nature, feeing that theee will always be a lateral efllux, the determination of the impulte is as uncertain and vague as it was fure and precife in the former cafe.

## $111]$

R ES
It is therefore without proper authority that thic Refinerce, abfolute impulfe of a vein of fluid on a plane which re. cenves it wholly, is afferted to be proportional to the finc of incidence. If indeed we fuppofe the velocity in G and H are equal to that at $A$, then $b=\beta,=a$, and the whole impulfe is $2 a \sqrt{1-c^{2}}$, as is commonly fuppofed. But this cannot be. Both the velocity and quantity at H are lefs than thofe at G. Nay, frequent$l_{y}$ there is roo efflux on the fide H when the obliquity is very great. We may conclude in general, that the oblique impulie will always bear to the direct impulie a greater proportion than that of the fine of incidence to radins. If the whole watcr efcapes at $G$, and none goes off laterally, the prefure will be $2 a+2 a c-2 b c \times$ $\sqrt{1-c^{2}}$. The experiments of the Abbe Boflut fhow in the plainef manner that the preflure of a vein, Ariking obliquely on a plane which receives it wholly, diminifhes falter than in the ratio of the fquare of the fine of incidence; whereas, when the oblique plane is wholly immerfed in the fream, the impulie is much greater than in this proportion, and in great obliquities is nearly as the fine.

Nor will this propofition determine the impulfe of a fluid on a plane wholly immerfed in it, even when the impulfe is perpendicular to the plane. The circumfance is now wanting on which we can effablith it calculation, namely, the angle of final defestion. Couid this be afcertained for each filament, and the velocity of the filament, the principles are completely adequatc to an accurate folution of the problem. In the experiments which we mentioned to have been made under the infpection of Sir Charles Knowles, a cylinder of fix: inches diameter was expofed to the action of a Aream moving precifely one foot per fecond; and when certain deductions were made for the water which was held adhering to the poferior bafe (as will be noticed afterwards), the impulfe was found equal to $3 \frac{7}{8}$ ounces avoirdupois. There were 36 coloured filaments difributed on the ftream, in fuch fituations as to give the moft ufeful indications of their curvature. It was found neceffary to have fome which paffed under the body and fome above it ; for the form of thefe filaments, at the fame diflance from the axis of the cylinder, was confiderably different : and thofe filaments which were fituated in planes neither horizontal nor vertical took a double curvature. In fhort, the curves were all traced with great care, and the deflecting forces were computed for each, and reduced to the direction of the axis; and they were fummed up in fuch a manner as 10 give the impulfe of the whole llream. The deflections were marked as far a-head of the cylinder as they could be affuredly obferved. By this method the impulfe was computed to be $2 \frac{1}{1} \frac{5}{6}$ ounces, difiering from obfervation $\frac{3}{3_{8}}$ of an nunce, or about $\frac{x_{1}}{5}$ of the whole; a difference which may moft reafonably be alcribed to the adhefion of the water, which mult be moft fenfible in fuch fmall velocities. Thefe experiments may therefore be confidered as giving all the confirmation that can be defired of the jullnefs of the principles. This indeed hardly admits of a doubt: but, alas! it gives us but fmall alfillance; for all this is empirical, in as far as it leaves us in every cafe the talk of obferving the form of the curves and the velocities in their different points. To derive fervice from this mof judicious method of Daniel Ber. roulli, we maftifeover fome methed of determining
àpriori,

 tamina cores efocery.
diate commanicatio ns uf motion are luch that the fmallcal pactible quantily ci inotion is produced. We feem obighed to corchude, that this law will be obterved in the fole t indance; and it fecms a problem net above our reah on da: rerine the motions which refult from it. Tie wrold recommend the problera to the eminent mathenatici i:s in fime limple cafe, fuch as the proroA.i norready denmatrated hy Daniel Bemonili, or the rertodedera impulfo on a cy linder included in a tubufit cama' ; and if the ey fuccest in thi, great things may be capeési. We think that experience gives great ancrumatacot. We fee that the ellinance to a flame fatice is a very finall mather freater than the vecizht of a colunn ef the fluid raving the fall productive of
t.e velecity for its lecinht, and the inall exeefs is mon Refinance. prabably owing to aditetion, ant the meafure of the real refittance is probably precifcly this weight. The velocity of a fpouting thid was found, in lact, to be that acepuired by falling from the furtace of the Huid: and it was by looling at this, as at a pole flar, that Newton, bernoulli, and others, have with great lagaciiy and ingenuity dilewered much of the laws of hydranlics, liy fenching for principles which would give this refilt. We may lope for fimilar fuccefs.

In the mean time, we may receire this as a phyfieal truth, that the perpendicular impulfe or tefiftanee of a plane firface, wholly immerfed in the haid, is equal to the weight of the column having the furface for its b.fe, and the fall producing the velocity for its height.

This is the medium refult of all experiments made in thefe precife circumfances. And it is confirmed by a fet of experiments of a kind wholly different, and which feem to point it ont more celtainly as an immediate contequenee of hydrulic principles.

If Mr Pitot's tube be expofed to a flream of fluid Experiiffing from a refervoir or velfel, as reprefented in ment by fig. 1+ with the open month I pointed directly againft Mr Pitot's the lleam, the floid is obferved to fand at $\mathbb{K}$ in the upright tube, precifely on a level with the fluid $A B$ in Hate the referwoir. Here is a mof unexceptionable experiment, in which the impulfe of the ftram is actually oppofed to the hydroftatical preffure of the fluid on the tube. Preffire is in this cale oppofed to prefiure, becaufe the iffuing fluid is deflected by what tlays in the mouth of the tube, in the fame way in which it would be deflected by a firm furface. We fall have occafion by and by to mention fome mof valuable and inftruetive experiments made with this tube.

It was this which fuggefted to the great mathema- Fu'cr's tician Euler another theory of the impulfe and refit-theory. ance of tluids, which muft not be omitted, as it is apFlied in his elahorate performance On the Theory of the Conftruation and working of Ships, in two volumes 4 to, which was afterwards :bbridged and ufed as a tiat-book in fome marine acajemies. He fuppofes at flrcam of Aluid ABCD (fig. 15.), moving with any velocity, to frike the plane BD perpendicularly, and that part of it groes through a hole EF, forming a jec EGHF. Mr Fuler fays, that the velocity of this jet will be the fane wifh the velocity of the fream. Now compare this with an equal fream iffuing trom a hole in the licie of a vefle with the fame velocity. The one fream is urged nut liy the preffure occationed by the imanie of the fluid; the other is urged out by the refluse of gravity. 'The effeqs are equal, and the modifying circumtances ate the fame. The caufes are therefore equall, and the preffure occafionad by the impulfe of a ftream of furd, moving with aur velocity, is egual to the weight of a column of tluid whofe height is productive of tilis velocity, sec. He then deternines the oblique impulfe by the refilution of motion, and deduces the common rules of refillance, \&e.

But all this is withont juft gromeds. This gentleman wats always fitisfed with the flighteli analugies vhich would give hirn an opportunity of exlibiting his grat dexterity in algebraic aralyfis, and was not afterwatds Martled by any difcordancy with obfervation. Anaty magis fitend.m is a frequent allertion with him.

## RES

Refinance. Tliough he wrote a large volume, containing a theory of light and colours totally oppofite to Newton's he has publithed many differtations on optical phenomena on the Newtonian principles, exprefsly becaule his own principles non ideo fucile anfant friebebat analys inforu-

Not a fhadow of argument is given for the leading principle in this theory, viz. that the velocity of the jet is the fane with the vclocity of the ftream. None can be given, but fitying that the preffure is equivalent to its production; and this is affuming the very thing he labours to prove. The matter of fact is, that the velocity of the jet is greater thaia that of the fream, and may be greater almoft in any proportion. Which curious circumftance was lifcovered and ingeniouly cxplained long ano by Danicl Berroulli in his Hydrodynamica. It is evident that the velocity mult be greater. Were a ltream of fand to come againft the plane, what goes through would indeed preferve its velocity unchanyed: but when a real fluid ftrikes the plane, all that does uot pafs through is deflected on all fides; and by theie deflections forces are excited, by which the filaments which furround the cylinder immediately fronting the hole are made to prefs this cy:inder on all fides, and as it werefqueze it between them: and thus the particles at the hole malt of necefity be accelerated, and the velocity of the jet muft be greater than that of the fream. We are difpofed to think that, in a fluid perfecly incompreffible, the velocity will be doubled, or at leaft increafed in the proportion of 1 to $\sqrt{2}$. If the fluid is in the fmallet degree compreffible, even in the very fmall degree that water is, the veloci:y at the firlt impulfe may be much greater. D. Bernoulli found that a column of water moving 5 feet per fecond, in a tube fome hundred feet long, produced a velocity of 136 feet per fecond, in the firft moment.

There being this adical defeet in the theory of Mr Euler, it is needlefs to take notice of its total infufticiency for explaining oblique impulfes and the refiftance
fuch motion wiil produce an inequality of prefture, R. fitarce. which will determine the fucceeding moti, mes. He there. *are fore endeavourcd to reduce all to the difovery of the fe difturbing proffures, and thus to the law's of haydrollatics. He lad long bewe this hit on a very refind and ingrenicus view of the actio 11 or bodies on each other, which bad enathed him to folve many of the meft difficult problems concerning the motions of bodies, fuch as the centre of ocilldation, of fpoutaneous converlion, the proctlion of the equmoxes, \&:c. Sic. with great fircility and clegance. He faw that tise fame principle would apply to the action of fluid bodics. The principle is this.
"In suhatever manner any number of lodies are fuppofed to ad on each other, and by thefe aations come to chrange their trefent mations, if zue conceive that the motion awtich each body swordd bave in the folowing inflant (if it lecane frce), is refolved into trwa other notions ; one of suhti.h is the motion eubich it really takes in the following indant; the other will be fuch, that if each body bad no other motion but this fecond, the aviale bodies would have remained. in equilibrio." We here obferve, that "the motion which each body would have in the following inftant, if it became free," is a continuation of the motion which it has in the firft in!tant. If may therefore perhaps be better expreffed thus:

If the motions of bodits, any how acting on each other, he confidered in trwo confecutive inflants, and if ave conceive the motion which it has in the firfl inflant as compooinded of tzoo olbers, one of which is the molion which it actually takes in the ficound inflant, the otlier is fuch, that if eact body bad only thofe fecond motions, the whbole fivfem avould have remained in equilibrio.
The propofition itfelf is evident. For if thefe fecond motions be not fuch as that an equilibrium of the whole fyftem would refult from them, the other component motions would not be thofe which the bodies really have after the change; for they would neceffarily be altered by thefe unbalanced motions. Sce D'Alembert Efai de Dynamique.

Affifted by this inconteftible principle, Mr d'Alembert demonftrates, in a manner equally new and fimple, thofe propofitions which Newton had fo cautioufly deduced from his hypothetical fluid, fhowing that they were not limited to this hypothefis, viz. that the motions produced by fimilar bodies, fimilarly projected in them, would be fimilar; that whatever were the preffures, the curves defcribed by the particles would be the fame; and that the refiltances would be proportional to the lquares of the velocities. He then comes to confider the fluid as having its motions conftrained by the form of the canal or by folid obftacles interpofed.

We fhall here give it fimmary account of his funda- sumivary mental propofition.

It is evident, that if the body ADCE (fig. J 6.) did not form an obftruation to the motion of the water, the particles would defcribe parallel lincs TF, OK, PS, icc. propuf But while yet at a diftance from the body in $F, \mathcal{K}, \mathrm{~S},{ }^{\text {11atate }}$ they gradually change their directions, and delcribe the ccecxaxva. curves FM, $\mathrm{K}_{m}, \mathrm{~S}_{n}$, fo much more incurvated as they are nearer to the body. At a certain diftance ZY this curvature will be infenfible, and the fluid included in the fpace ZYHC will move uniformly as if the folid body were not there. The mations on the other fide of the axis $A C$ will be the fame; and we need only $P$ attend

## に E S

R 1 1̂ame. $\rightarrow$ attend to one 1hat:, and we fhall conîder thefe as in a da:ce of petmanames.
$N$, budy changes either its direquis or vel.sity otherwite thin by intenitible degrecs: therefore the particle Whith maving in the a a is will not reach the vertex A of the bella, where it beloned to dellet inllantane. nunly at a ight an, iles. It will therefife begin to be deMested at tome phint $F$ arhead of the body, and will de. Sinibe a curve FM, touching the axis in 1 ; and the body in MI and then, glidins ale wh the body, wiil quit it at fome point L , decicibing a tangent curve, whici will join the axis again (truching it) in $R$; and thus there will be :t cuantity of fiagnant w.ter FAM before or athe:ad of the body, and another L.CR behind or aftern of it.
Let $a$ be the velocity of a particle of the fluid in any inftant, and $a^{\prime}$ its velocity in the next inllant. The wlocity a may be confidered as compounsed (f $a$ ' and $a^{\prime \prime}$. If the particles tended to move will the velocities $a^{\prime}$ ' only, the whole fluid would be in equilitrin (general principle), and the preffure of the fluid would be the fime as if oll were ftagnant, and each particele were urged by a force $\frac{a^{u}}{l}$, $t \cdot$ exprefling an indclinitely finall moment of time. (A. S. $\frac{a^{\prime \prime}}{t}$ is the proper expreffion of the accelcrating force, which, by afting during the mo. meas ${ }^{\prime}$, would generate the velocity $a^{\prime \prime}$; and $a^{\prime \prime}$ is fup. poried an indeterminate quantity, different perhaps for each particle). Now let a be fuppofed conitant, or $a=a$. In this cafe $a^{\prime \prime}=0$. That is to fyy, no pref. fure whatever will be exerted on the folid body unlefs there happen changes in the velocities or directions of the particles.

Let $a$ and $a^{\prime}$ then be the motions of the particles in two confecutire inliants. They would be in equilibrio if urged only by the forces $\frac{a^{\prime \prime}}{t}$. Therefore if $r$ be the point where the particles which defcribe the curve FM begin to change their velocity, the preffiue in D would be equal to the preflure which the fuid contained in the canal $\gamma$ FMD wuuld exert, if each patticle were folicited 1.y its force $\frac{a^{\prime \prime}}{l}$. The queftion is therefore reduced to the finding the curvature in the canal 2 FMD, and the accelerating forces $\frac{a^{\prime \prime}}{t}$ in its diffe:ent parts.

It appears, in the firlt place, that no preflure is exerted by any of the particles along the curve FM: for fuppofe that the particle a (fig. 17) deficribes the indefinitely mall ftraight line $a b$ in the firli inftant, and $b c$ in the fecond inftint; ; roduce $a b$ till $b d=a b$, and joining $d e$, the motion a $b$ or $4 d$ may be compidered as comporied of $l$, which the particle really takes in the next inflant, and a murtion dc which thould be deftroy$c d$. Draw $b i$ pirallel to $d c$, and $i e$ perpendiculde to $b$. It is plain that the paticle $b$, folicited by the forces be, ei (equiv.alent to $d c$ ) thould be in equilitrio. This being effablilihed, $l$ e muft be $=0$, that is, there will be no accelcrating or retarding foree at $l$; for if there be, draw $\ell m$ (fig. 18.) perpendicular to $\ell \mathrm{F}$, and the patallel $n q$ infil itely near it. Thee part $l n$ of the furd contained in the carial $6 n q m$ would fuftais fone pref.
fure from $l$ towards $n$, or from $n$ towards $b$. Therefore Refinance. fince the fluid in this !lagnant canal thould be in equilibrio, there mult alio be tome action, at leaft mone of the parts $b m, m q, q n$, to counterbalance the action on the part $\ell n$. But the Huid is Atgenant in the fpace FAM (in coniequance of the law of continuity). Therefure there is no force which can aft on $b \mathrm{~m}, \mathrm{~m} q$, $q n$; and the preffure in the camal in the direction $b n$ or $n b$ is nothing, or the force $l e=0$, and the force $i e$ is perpendicular to the canal; and there is therefore no preflure in the canal FM, except what procceds from the part $2 \mathrm{I}^{\prime}$, or from the force $e^{\circ}$; whichlat being perpendicular to the canal, these can be no force exerted on the point $M$, but wat is propagated from the part $\% \mathrm{~F}$.
'the velocity therefore in the canal FM is conltant if finite, or in finitely fmall if variable: for, in the firit cafe, the force $b$ e would be abfolutcly nothing; and in the fecond cafe, it wuld be an infinitefimal of the f:cond order, and may be confidered as nothing in con:parifun with the velocity, which is ol the firlt order. We thall fee by and by that the laft is the real Ilate of the catic. Theretore the fluid, before it begins to chamge its direstion in $F$, begins to change its velocity in fome point $z$ a-head of $F$, and by the time that it reaches $F$ its velocity is as it were annihilated.

Cor. 1. Therefore the pretlure in any point $D$ arifes both from the retardations in the part o $F$, and from the particles which are in the canal MD : as thefe lalt move along the furface of the body, the force $\frac{a^{\prime \prime}}{t^{\prime}}$, deftrosed in every particle, is compounded of two others, one in the direction of the furface, and the other perpendicular to it; call there $p$ and $p$ '. The point 1$)$ is prelled perpendicularly to the furtace MD; ift, by all the forces $p$ in the curve MD; $2 d$, by the force $p^{\circ}$ :acting on the fingle point $D$. This may be neglected in comparifon of the indefinite number of the others: therefore taking in the arch MD, an infinitely fimall portion $\mathrm{N} m,=j$, the preffure on D , perpendicular to the furface of the body, will be $=f_{p} \cdot s$; and this fluent muf be fo taken as to be $=0$ in the point $M$.

Cor. 2. Therefore, to find the preflure on D , we mult find the force $p$ on any point $N$. Let $u$ be the velocity of the particle N , in the direction $\mathrm{N} m$ in any infant, and $u+\ddot{u}$ its velocity in the following inftant; we muft have $p=\frac{-u}{t^{\circ}}$. Therefore the whole quention is reduced to finding the velocity $u$ in every point $N$, in the direction $\mathrm{N} m$.

And this is the aim of a feries of propofitions which follow, in which the author diflays the mon ancurate and preciie conception of the fubjea, and great addurefs and elegance in his mathematical analytis. He at length brings out an equation which exprefles the preffire on the body in the mof general and unexceptionuble manner. We camot give an abltract, becaufe the train of reafoning is already concife in the extrene: nor can we even exhibit the final equation ; for it is conccived in the moft refined and abllrufe form of indereminate functions, in order to embrace cvery poffible circumfance. But we can affure our readers, that it truly expreffes the folution of the problem. Lit, alas! it is of
$6 r$
His final equation truly folves the problcm; but 2

## R E S

Refilance. 62 From the imperfect Itate of mathemztics it is ufclefs.
no ufe. So imperfect is our mathematical knowledge, that even Mr d'Alembert has not been able to exemplify the application of the equation to the fimpleat cafe which can be propofed, fuch as the direat impulfe on a plane furface wholly immerfed in the fluid. All that he is enabled to do, is to apply it (by fome modifications and fubitututions which take it out of its Aate of extreme generality) to the dired impulfe of a vcin of fluid on a plane which deflects it wholly, and thus to fhow its conformity to the folution given by Daniel Bernoulli, and to obfervation and experience. He flows, that this impulfe (independent of the deficiency arifing from the plane's not being of infinite extent) is fomewhat lefs than the weight of a column whofe bafe is the fection of the vein, and whofe height is twice the fall neceffiry fur communicating the velocity. This great philofopher and geometer concludes by faying, that he does not believe that any method can be found for folving this problem that is more direet and fimple; and imagines, that if the deductions from it thall be found not to agree with experiment, we mult give up all hopes of determining the refiftance of fluids by theory and analytical calculus. He fays analytical calculus; for all the phyfical principles on which the calculus proceeds are rigoroully demonltrated, and will not admit of a doubt. There i: only one hyfothefis introduced in his inveftigation, and this is not a phyfical hypothefis, but a hypothelis of calculation. It is, that the quantities which determine the ratios of the fecond fluxions of the velocities, eflimated in the direftions parallel and perpendicular to the axis $A C$ (fig. 16.) are functions of the abfciffa AP, and ordinate PM of the curve. Any perfon, in the leaft acquainted with mathematical analyfis, will fee, that without this fuppolition no analylis or calculus whatever can be inftituted. But let us fee what is the phyfical meaning of this hypothefis. It is fimply this, that the motion of the particle M depends on its fituation onls. It appears impoffible to form any other opinion; and if we could form fuch an opinion, it is as clear as day-light that the cafe is defperate, and that we muft renounce all ply to fimple
cafes; hopes.
We are ferry to bring our labours to this conclufion; but we are of opinion, that the only thing that remains is, for mathematicians to attach themfelves with firmnefs and vigour to fome fimple cafes; ar.d, without aiming at generality, to apply Mr d'Alembert's or Ber- noulli's mode of proccdure to the particular circumftances of the cate. It is not improbable but that, in the folutions $u$ hich may be obtained of thefe particular cafes, circumetances may occur which are of a more ger.eral nature. Thefe will be fo many laws of hydraulics to be added to our prefent very fcanty fock; and thefe may have points of refemblance, which will give birth to laws of till greater generality. And we repeat our expreffion of hopes of fome fuccefs, by endeavouring to determine, in fome fimple cafes, the minimun poflibile of motion. The attempts of the Jefuit commentators on the Principia to afcertain this on the Newtonian hypothefis do them honour, and have really given us great alliftance in the particular cafe which came througls their hands.

And w'e thould multiply experiments on the refirtance of bodies. Thofe of the French academy are un-
doubtedly of inetimable value, and will alvays be ap-
pealed to. But there are circumftances in thefe esperiments which render them more complicated thatu is proper for a general theory, and which therefore linnit the conclufions which we wilh to draw from them. The bodies were floating on the furface. This greatly noodifies the deflections of the filaments of water, caufing fome to deffect laterally, which would ntherwife have remained in one vertical plane; and this circumflance alfo neceflarily produced what the academicians called the remou, or accunulation on the anterior part of the body, and depreffion behind it. This produced an additional refiftance, which was meafured with great dificulty and uncertainty. The effect of adhefion mult alfo have been very contiderable, and very different in the different cafes; and it is of difficult calculation. It cannot perbaps be totally remored in any experiment, and it is neceffary to confider it as making part of the refiftance in the moft important practical cates, viz. the motion of hlips. Here we fee that its effect is very great. Every feamen knows that the fpeed, even of a copper-fheathed thip, is greatly increafed by greafing her bottom. The difference is too remarkable to admit of a doubt : nor fhould we be furprifed at this, when we attend to the diminution of the motion of water in long pipes. A fmooth pipe four and an half inches diameter, and 500 yards long, yields but one-fifth of the quantity which it ought to do independent of friction. But adhefion does a great deal which cannot be compared with friction. We fee that water flowing thro' a hole in a thin plate will be increafed in quantity fully one-third, by adding a little tube whofe length is about twice the diameter of the hole. The adhefion therefore will greatly modify the action of the filaments both on the folid body and on each other, and will change both the forms of the curves and the velocities in different points; and this is a fort of objection to the only hypothefis introduced by d'Alembert. Yet it is only a fort of objection; fer the effect of this adhefion, too, muft undoubtedly depend on the fituation of the particle.

The form of thefe experiments of the academy is ill. fuited to the examination of the refiftance of bodies, wholly immerfed in the fluid. The form of experiment adopted by Robins for the refitance of air and afterwards by the Chevalier Borda for water, is free from thefe inconveniences, and is fufceptible of equal accuracy. The great advantage of both is the exact knowledge which they give us of the velocity of the motion ; a circumftance effentially neceffary, and but imperfealy known in the experiments of Mariotte and others, who examined quiefcent bodies expofed to the action of a fream. It is extremely difficult to meafure the velccity of a Atream. It is very different in its different parts. It is fwifteft of all in the middle finperfi. cial filament, and diminifhes as we recede from this towards the fides or bottom, and the rate of diminuticn is not precifely known. Could this be afcertained with the neceffary precifion, we fhould recommend the following form of experiment as the moll fimple, eafy, economical, and accurate.

Let $a, b, c, d$, (fig. 19.) be four hooks placed in a horizontal plane at the corners of a rectangular parallelogram, the fides $a c, b d$ leing parallel to the direction of the Atream ABCD , and the fides $a b, c d$ being perpendicular to it . Lei the body G be faltened to

## RES <br> [ 116] <br> RES

 -- lace on which the fuad is to at miy be inclined to the Areare ia the predife angle we detire. Let his axis hase hows at its extrenities, which are hitehed into the 1 reps of sour equal threads, fifpended from the ho is $\therefore, b, c, d$ and let 11 e be a fith thread tupend. ed frem the midule of the line joining the peints of ilipenaiun cob. lest HIli be a ghajuated arch, whote centre is H, and whofe phane is we the direstion of the neam. It is crident that the impulie on the body G will be metured (by a procels we!l known to every So :hematici.(in) be the devintion of the thread He from the vertionl line HI : and this will be done whout any iatrisacy of calculation, or any attention to the centres if gravity, of ofillation, or of perculfion. Thefe mant be accurateiy afeertained with relpeit to that :orm in whels the pendulum has alwass been employed for meaturing the impuife or velocity of a fream. There adrantages arife from the circumllance, that the axis of renaius always paralle] to the horian. We may the allowed to obferve, by the by, that this would hive been a great improvement of th: be.utiful experiments of Mr Robins and Dr Hutton on the velocities of camon-hot, and would have fived much intricate calculation, and been attended with maniy important advant.izes.
'Ho great difficuley is, as we have obferved, to meafure che velucity of the fream. Even chis may be done in this way with fome prection. Let two fluating bodies be dragged along the lurface, as in the experiments of the academy, at fome diffaice from each other lateradly, fo that the water hetween them may not be lenfibly diturbed. Let a hurizontal bar be rttached to them, tranlverfe to the direction of their motion, at a proper height: above the furface, and let a fpherical pendulum be fuipended fiom this, or let it be fufpended from lour points, as here deferibed. Now let the deviation of this pendulum be uoted in a varicty of velocities. This will give us the law of relation between the velccity an 1 the deviation of the pendulum. Now, in making experiments on the reliftance of bodies, let the velucity of the Ate.m, in the very fill. ment ia which the retiftance is meafured, be determinid by the deviation of this pendulum.

It were greatly to be withed that fume more palpable argument could be found tor the exitlence of a quantity of thennat fuid at the anterior and potter or parts of the bidy. The one already given, derived from the confite ati in that no motion clanjes either its velocity or dirction by finite quantiies in an infant, is unexceptionable. But it geves us litele inl rmation. The tinallefe conces sabice extent of the curve IM in fig. 26. will anfwer this comdisin, provided only that it twehes the axis in fome $p$ int $I$, and the body in fome paint 1I, fo as not to mal:e a livite angle with cither. But furely there are circum, innes which riporously deterxati.e the cextent of $\mathrm{t}^{\prime}$ is th ugnant fluid. And it appears withunt doub:, that if thate wre in cohelion or fricthen, this fpuce whil have a determined ratio to the fize of tle body (the figure, of the bondie, being fuppofed Imilar). Suppofe a thane furface $A 13$, as in fige 10. there can be n: dion't tit that the figure A a i) 6 B will in every cale be fimilar. But if "e fuppofe an adtefion or tenacity which is conf:unt, this may make a change both in its estent and in its form: lot its con-

Alancy of form depends on the difurbing furces being Refinance. :lways as the foumes of the velocity; and this ratio of the difturbing forces is preferved, while the intertia of the fluid is the only agent and fatient in the procefs. But when we add to this the combant (uhat is, invariable) difturbing forse of tenacity, a cliange of form and dimentions mut happen. In like manner, the frittion, or fomething analogous to frition, which produces an effert proportional to the vilocity, mutalter this neceffary ratio of the whele dillurbing furce. We may conclude, that the elfect of both thefe circumftances will be to diminith the ghantity of this ftagnant fluid, by liching it away externally; and to this we mutt afribe the fat?, that the part FAM is never perfedly. fa:agnant, but is generally difurbed with a whinling motion. We may alio conclude, that this faagnant fluid will be more incurvated between F and M than it would have been, independent of tenaciyy thd friction; and that the arch LR will, on the contrary, be lefs incur-vated.-And, laitly, we may conclude, that there will be fomethars eppolite to preffine, or fomething which we may call diflragion, exerted on the polterior part of the body which moves in at tenacivas fluid, or is expofed to the fream of fuch a fluid; for the fagnamt fluid LCR adheres to the furface LC; and the patfirg fluid tends to draw it away both by its tenacity and by its fiction. This muft aug ment the apparent impulfe of the firtan on fuch a bociy; and it numt grearly augnent the refifance, that is, the motion lott by this body in its progrets through the tenacious fluid: for the body muft drag along with it this Atagnant fuid, and drag it in oppolition to the tenacity and friation of the furrounding fluil. The effed of this is mot remarkably feen in the efiftances wo the motion of pendulums; and the chevalier Buat, in his examination of Newton's experiments, clearly thows that this conftitutes the greateft part of the refiftance.

This mof ingenious writer has paid great attention to this part of the precets ni nature, and has land the foundation of a theory of :cfillance entirely different from all the preceding. We cannct abridge it; and it is tw imperfeat in its prefent condition to be offered as a bedy of doitrine: but we lope that the ingenions authas will profecute the fubject.

We cannot conclude this difertation (which we acknowledge to be very unfatisfactory and imperfea) better, than by giving an account of fome experimems of the chevalier Buat, which feem of immense confequerce, and tend to give us very new views of the fubject. Mr lluat offerved the motion of water infuing from a glafs cylinder through a narrow ring formed by a bottom of finaller diameter; that ic, the cylinder was open at both ends, and there w.as placed at its lower end a circle of dmaller diameter, by way of bottom, which left a ing all arcund. He threw fome powdered fealing wax into the water, and obferved whith great attention the m tion of its fmall particles. Ile faw thefe which happened to be in the very axis of the eglinder defiend along the axis with a motion pretty uniform, till they cime very near the bothm; from this they continued to defcend wery flowly, till they were almof in contact with the botoon; they then deviated from the centec, and approachod the orifice in Ataighs

## RES

Refifance. Araight lines and with an accelerated motion, and at laft darted into the orifice with great rapidity. He had oblerved a thing fimilar to this in a horizontal canal, in which be had fet up a fnall board like a dam or bar, over which the water flowed. He had thrown a goofeberry into the water, in order to meafure the velecity at the bottom, the goofeberry being a fmall matter heavier than water. It approached the dam miformly till about three inclies from it. Here it almof food ftill, but it continued to advance till almoft in contaci. It then rofe from the bottom along the infide of the dam with an accelerated motion, and quickly efcaped over the top.

Hence he concluded, that the water which covers the anterior part of the body expofed to the fream is not perfectly fagnant, and that the filaments recede from the axis in curves, which converge to the furface of the body as different hyperbolas converge to the fame aflymptote, and that they move with a velocity continually increaling till they efo:"pe round the fides of the body.

He lad eflablifhed (by a prutty reafonable theors, confirmed hy experinent) a propofition concerning the preilure which water in motion exerts on the furface along which it glides, viz. that the preffure is equal to that which it would exert if at refl minus the weight of the column zulogi height woonld produce the velocity of the fafing fream. Coniequently the preflure which the floam exerts on the furface perpendicul:irly expufed to it will depend on the velocity with which it glides along it, and will diminih from the ceatre to the circumference. This, fays he, may be the reafon why the impulfe on a plane wholly immerfed is but one half of that on 68 a plate which deflects the whole ft.eam.
And of the He contrived a very ingentous inftrument for examiinftrument ning this therry. A fquare brafs plate ABC'F (fig. he cn. trived for exanining his theory
20). was pierced with a great number of holes, and fixed in the front of a thallow box reprefented edrewife in fig. 2t. The back of this box was pierced with a hole $c$, in which was inferted the tube of glafs CDE, bent fquare at D . This inftrument was expofed to a itream of water, which beat on the bralṣ plate. The water having filled the box through the holes, ftood at an equal height in the glafs tube when the furrounding water was ftagnant ; but when it was in morion, it always food in the tube above the level of the imonth water without, and thus indicated the preffure occationed by the action of the fream.

When the inftrument was not wholly immerfed, there was always a confiderable accumulation agdint the fre nt of the box, and a deprellion belind it., The water before it was by no means ftaghant: indeed it thould not bc, as Mr Buat obferves; for it confifts of the water which was efcaping on all fides, and therefore upwards from the axis ot the ftream, which meets the plate perpendicularly in $c$ confiderably under the iurface. It eficapes upwards; and if the body were fuffictently immeried, it would cic:upe in this direction almoit as eafily as laterally. But in the preent circumftance, it heaps up , till the elevation occations it to fall off fidewife as faft as it is renewed. When the inftrument was immer. fed more than its femidiameter under the furface, the water ttill rofe above the level, and there was a great deprefion immediately bebind this elevation. In confeguence of this difficulty of efcaping upwards, the wa-
ter flows off laterally; and if the horizontal dimenfions Refifance, of the furface is great, this lateral eflux becomes more difficult, and acquires a greater accumulation. Fiom this it happens, that the refiftance of broad furlaces equally immerled is greatcr than in the proportion of the breadth. A plane of tro feet wide and one foot deep, when it is not completely immerfed, will be mose selifled than a plane two feet deep and one foot wide ; for there will be an accumulation again't both: and even if chefe were equal in height, the additional furface will be greateft in the widelt body; and the elevation wiii be greater, becaufe the lateral efcape is more dificult.

The circumftances chiefly to be attended to are Circun:thefe.

The preffure on the centre was much greater than towards the border, and, in general, the herght of the waed to in ter in the tube DE was more than $\frac{4}{3}$ of the height ne-ufing this ceffary for producing the velocity when only the cen-inkrutral hole was open. When various holes were opened ment. at different diftances from the centre, the height of the water in DH continually diminifled as the hole was nearer the border. At a certain diffance from the border the water at $E$ was level with the furrounding water, fo that no preffiure was exerted on that hole. But Rennarkthe moft unexpected and remarkable circumftance was, able cirthat, in great velocities, the holes at the very border, cumflazes: and even to a fmall diftance from it, $n, t$ only fuftained no preflure, but even gave cut water; for the water in the tube was lower than the furrounding water. Mr Buat calls this a non-preffion. In a cafe in which the vel city of the ftrcam was three feet, and the preffure on the central hole caufed the water in the vertical tube to fland 33 lines or ${ }^{\frac{23}{2} \frac{3}{2}}$ of an inch above the level of the furreunding foooth water, the ation on a hole at the lower corner of the fquare caufed it to fand 12 lines lower than the furrounding water. Now the velocity of the flream in this experiment was 36 inches per fecond. This requires $2 \frac{1}{2}$ lines for its productive fall; whereas the preilure on the central hole was 33 . This approaches to the preffure on a furface which deflects it wholly. The intermediate loles gave every variation of preflure, and the diminution was more rapid as the holes were nearer the edge; but the law of diminution could not be obferved.

This is quite a new and molt unexpected circum- Not iurnnfance in the ation of fluids on forid bodies, and ren- fitent with ders the fubjeet more intricate than ever; get it is by the princhno means incontifitent with the genuine principles of ples of liyhydroftatics or hydrablics. In as far as Mr Buat's or hydraupropntition concerning the prefure of moving fluids lics. is true, it is very icafonable to fay, that when the lateral velocity with which the fluid tends to efcape exceeds the velcei $y$ of percufion, the height necelfiary for producing this relocity nuft excced that which would produce the other, and a non-prefion mult be obferved. And if we contider the forms of the lateral filements near the edge of the body, we fee that the concavity of the curve is turned $t$ wards the body, and that the centrifugal forces tend to diminifh their preffure on the body. If the middle alone were flruck with a confiderable velocity, the w.ter might even rebound, as is frcquently obferved. This actual rebounding is lere prevented by the furrounding water, which is moving with the fame velocity: but

 - to r.b und at the inacr til...ments.
F.art (aral rerineps a conifiderable part) of this apparene mon-protion is undembiedly produced by the tenaaly of te water, whith lick onl weh it the water lying in the 1.1. liut, at any rate, this is an immense. It gives a key to many curious phemomeno in the reflence of thuids; and the theciy of Mr buat deferves a very ferious contideration. It is all
concrimed in the two following propolitions.

1. "If, by ary canfe su'hatezer, a colunn of finid, zubether mati,g purt of ans indefinite fluid, or cortuined in föll cumal, whes to move suish a civen zelocity, the prefure suthch is . .arrald laterally bifore its motion, ei.her on the ath joring fiul or on this fites of the canal, is diminiked by the steigh fol co'amn bativis the height nceefary for conmsuni. cuting the evelotity of the mation.
2." The preflure on the centre of a plane furface perpendic:tar to the fiream and cobolly immorfed in it, is $\frac{3}{2}$ of the suetight of a ciumn bavint the keight ne eflary for com-

He attempted to afcetain the medium preflue on the whole furliace, by opening 625 holes difperfed all over it. With the fame velocity of current, he found the heighs in the iube to be 29 lines, or $7 \frac{1}{2}$ more than
the height neceffary for producing the velocity. But he jultly coneluted this to be too great a meafure, becavie the holes were $\frac{1}{4}$ of an inch from the edge : had there been holes at the very elge, they would have fuf. tained a non-prelfion, which would have diminifled the height in the tube very confiderally. He expofed to the farse fleam a conical funnel, which raifed the water to 34 lines. But this could not be confidered as a mealure of the preflure on a plane folid furface; for the central water was undoubtedly foonped out, as it were, and the filaments much more deflected than they weuld have been by a plane furface. Perhaps fomething of this happened even in every fmall hole in the former experiments. And this fuggelts fome doubt as to the accuracy of the meafurement of the preffure and of the velocity of a current by Mr Pitot's tube. It furely renders iome corredtions abfolutely neceffary. It is a fas, that when expofed to a vein of fluid coning through a thort paltage, the water in the tube flands on a level with that in the refervoir. Now we know that the relocity of this fream dres not exceed what would be produced by a fall equal to $\frac{82}{100}$ of the head of water in the refervoir. Mr Buat made many valuable obfervations and improvements on this molt ufeful inftrument, which will be taken notice of in the articles $\mathrm{R}_{1}$ veps and Wrate Works.

Mr Buat by a fcrupulous attention to all the circumfances, concluder, that the medium of preflure on the whole furfacc is equal $\frac{25,5}{21,5}$ of the weight of a column, having the furface tor its bafe, and the productive fall for its height. But we think that there is an uncertainty in this conclufion; becaufe the height of the water in the vertical tube was unduabsedly augmented by an hydroftatical prefiurc arifing from the accumulation of water above the body which was expofed to the Ateam.

Since the preflures aire as the fquares of the veloci-
ties, or as the heights $b$ wich produce the velocities, Reffance. we maty exprefs this preflure by the fymbol $\frac{25,5}{21,5}$, or 1,1866 , or $m$, the value of $m$ being 1,186 . This exceeds comfiderably the refult of the experiments of the French academy. In thefe it does not appear that $m$ fenfibly exceeds unity. Note, that in there experiments the body was moved through fill water; here it is crpofed to a Ricam. Thefe are generally fuppofed to be equivalent, on the authority of the third law of mo. tion, which makes every ation depend $r$.n the relative motions. We thall by and by fee fome caufes of difference.

The writers on this fubjeet feem to think their taflk The actiou enmpleted when they have confidered the alion of the on the hinfluid on the antenior part of the body, or that part of der pare of it which is before the broadelt feation, and have paid a bedy or litule or no attention to the hinder part. Yet thofe who fly $p$ equalare moll interelled in the fubject, the naval architeds, tamp with feem convinced that it is of no lefs importance to at- that on the tend to the form of the hinder part of a thip. And fore-part. the univerfal practice of all nations has been to make the hinder part more acute than the fore part. This has undoubtedly been dednced from experience; for it is in direat oppolition to any notions which a perfon would naturally form on this fubject. Mr Buat therefore thought it very necellary to examine the action of the water on the hinder part of a body by the fame method. And, previous to this examination, in order to acquire fome fcientific notions of the fubject, he made the following very curious and infructive experiment.

Two little conical pipes AB (fig. 22.) were inferted into the upright fide of a prifmatic veffel. They were an inch long, and their diameters at the inner and outer ends were five and four lines. A was 57 lines under the furface, and B was 73. A glafs fyphon was made of the flape reprefented in the figue, and its internal diameter was $\frac{1}{4}$ lines. It was placed with its mnuth in the axis, and even with the bafe of the conical pipe. The pipes being thut, the veffel was filled with water, and it was made to itand on a level in the two legs of the fyphon, the upper part bsing full of air. When this fyphon was applied to the pipe $A$, and the water ruming freely, it rofe 32 lines in the thort leg, and funk as much in the other. When it was applied to the pipe B , the water rofe 41 lines in the one leg of the fyphen, and funk as much in the other.

He reafons in this manner from the experiment. The ring comprehended between the end of the fyphon and the fides of the conical tube being the narroweft part of the orifice, the water ifflued with the velocity correfponding to the height of the water in the veffel above the orifice, diminifhed for the contraction. If therefore the cylnder of water immediately before the month of the fyphon iffucd with the fame velocity, the tube would be emptied through a height equal to this bead of water (charge). If, on the contrary, this cylinder of watcr, immediately before mouth of the fyphon, were fagnant, the water in it would exert its full preffure on the mouth of the fyphon, and the water in the fyphon would be level with the water in the vefiel. Between thefe extremes we mull find the real nate of the cale, and we mult meafure the force of non-preffure by the rife of the water in the fyphon.

We fec that in both experiments it bears an accurate

## K E S

$\underbrace{\text { Refifance. propottion to the depth under the furface. For } 57 \text { : }}$ $73=32: 41$ very nearly. He therefore cftimates the nun-preffure to be $\frac{5 \delta}{500}$ of the height of the water above the orifice.
We are difpofed to think that the ingenious author inaccurate. has not reafoned accurately from the experiment. In the firf place, the force indicated by the experiment, whatever be its origin, is certainly double of what he fuppofes; for it mult be meafured by the fum of the rife of the water in one leg, and its depreffion in the other, the weight of the air in tre bend of the Esphon being neglected. It is precifely analogous to the force acting on the water ofcillating in a jyphon, which is acknowledged to be the fum of the elevation and depreflion. The force indicated by the experiment therefore is $\frac{1}{1} \frac{1}{5} \frac{2}{3}$ of the height of the water above the orifice. The force exhibited in this experiment bears a fill greater proportion to the productive height; for it is certain that the water did not iflue with the velocity acquired by the fall from the furface, and probably did not exceed $\frac{2}{3}$ of it . The effect of contraction mult have been confiderabie and uncertain. The velocity fhould have been meafured both by the amplitude of the jet and by the quantity of water difcharged. In the next place, we apprehend that much of the effeck is produced by the tenacity of the water, which drags along with it the water which would have flowly iffued from the fyphon, and the other end not dipped intn the water of the veffel. We know, that if the horizontal part of tbe fyph in had been continued far enough, and if no retardation were occafioned by friction, the column of water in the upright leg would have accelerated like any heavy body; and when the lall of it had arrived at the butt.m of that leg, the whole in the horizontal part would be meving with the velccity acquired by falling from the furface. The water of the veffel which iffues through the furrounding ring very quickly acquires a much greater vel city than what the water defcending in the fyphon wouldacquire in the fame time, and it drags this laft water along with it both by tenacity and fristion, and it drags it out till its action is is nppofed by want of equilibrium produced in the fyphon, by the elevation in the one leg and the depreflion iti the other. We imagine that little can be concluded from the experiment with refpedt to the real nen-preflure. Nay, if the fides of the fyphon be fuppofed infinitely thin, fo that there would be no curvature of the filaments of the fiurumding water at the mouth of the fyphon, we do not very diftinctly fee any fource of nonpreffure: For we are not altogether fatisfied with the proof which Mr Buat offers for this meafure of the preffure of a fream of fuid gliding along a furface, and obfruted by frition or any olber caufe. We imagine that the paffing water in the prefent experiment would be a little retarded by accelerating continually the water defcending in the fyphon, and renewed a-top, fuppofing the upper end open; becaufe this water would not of itfelf acquire more than half this velocity. It however drags it out, till it not only refits with a force equal to the weight of the whole vertical column, but even exceeds it by $\frac{12}{100}$. This it is able to do, hecaufe the whole preffure by which the water iffues from an orifice has been hhown (by Daniel Bernoulli) to be equal to twice this weight. We therefore confider this beautiful experiment as chiefly valuable, by giving us a m:a-
fure of the tenacity of the water; and we wifh that it Befifance. were repeated in a variety of deptls, in order to difcorcr what relation the force exerted bears to the depth. It would feem that the tenacity, bcing a certain determinate thing, the proportion of 100 to 112 would not be conftant; and that the obferved ratio would be made up of two parts, one of them conftant, and the other proportional to the depth under the furface.

But ftill this experiment is intimately connected with the matter in hand; and this apparent non-preffurc on the hinder part of a body expofed to a ftream, from whatever caufes it proceeds, does operate in the action of water on this hinder part, and muft be taken into the account.
We mult therefore follow the Chevalier de Buat in his difculions on this fubject. A prifmatic body, haring its prow and poop equal and parallel furfaces, and plunged horizontally into a fluid, will require a force to keep it firm in the direction of its axis precifely equal to the difference between the real preffures exerted on its prow and poop. If the fluid is at reft, this differrence will be nothing, becaufe the oppofite dead preffures of the fluid vill be equal: but in a fream, there is fuperadded to the dead preflure on the prow the active proffure arifing from the deflections of the filaments of this fluid.

If the dead preffure on the poop remained in its full intenfity by the perfect ftagnation of the water behud it, the whole fenfible preffure on the body would be the active preffure only on the prow, reprefented by $m b$. If, on the other hand, we could fuppofe that the water behind the body moved continually away from it (beirig renewed laterally) with the velocity of the flream, the dead preffure wevid be entirely removed from its poop, and the whole fenfible preflure, or what muft be oppofed by fome external force, would be $m b+b$. Neither of thefe can happen; and the real ftate of the caie muft be between thefe extremes.
The following experiments were tried : The perfo. Experirated box with its vertical tube was expofed to the meutso flream, the brafs plate being turned down the ftream. The velocity was again 36 inches per fecond.

The central hole A alone being opened, gave a nonpreffure of

13 lines.
A hole B, $\frac{5}{6}$ of an inch from the edge, gave

15
A hole C , near the furface
15,7
A hole D, at the lower angle - 15,3
Here it appears that there is a very confiderable non-preffure, increafing from the centre to the border. This increafe undoubtedly proceeds from the greater laterai velocity with which the water is gliding in from the fides. The water behind was by no means flagnant, although moving off with a much fmaller velocity than that of the paling flream, and it was vifibly removed from the fides, and gradually licked away at its further extremity.

Another bux, having a great number of holes, all open, indicated a medium of non-preflure equal to $13, \frac{5}{5}$ lines.

Another of larger dimenfions, but having fewer holes, indicated a non-preffure of $12 \frac{{ }^{3}}{6}$.

But the moft remarkable, and the moft important phenomena, were the following:
The firft box was fixed to the fide of another box,

$$ They plainly fow how inportant it is to conlider the action on the hinder part of the bady. For the whole impalle or reliftunce, which munt be withnteod or overcome by the extrmal force, is thic fum of the ative preflure on the sire-part, and of the non preflure on the hinder-part ; and they fiow that this does not depend folely on the form of the prow and poop, but alfo, and perlaps chief1 y , on the length of the body. We fee that the nonpreffure on the hinder-part was prodigioully dinminilhad (reduced to one-foutith) by making the length of the body triple uf the trialth. And hence it appcars, that ruerely lengthening a flip, withont making any clange in the fom either of her prow on her poup, will greatly diminith the refirtance to her motion through the water ; and his incrafe of length may be made by continuing the form of the midthip frame in feveral timbers ::long the keel, by which the capacity of the hhip, and her power of carrying fail, will be greatly increafed, and her other cpalities improved, while her fpeed is augrientes.

It is furely of importance to ennfider a little the phytical canic of this change. The motions are ex. tiemaly complicited, and we mulf be contented if we
it is plain thit the real velocity of a flament in its oblipue path is augmented. We always obferve, that a Ituse lying in the fand, and expoled to the wath of the ie 1 , is lad bare at the bottom, and the fand is generally Wathed away to fome dittance all round. This is owing to the increated velncity of the water nhich comes into contra with the fone. It takes up more fand thin it can kecp thating, and it depofits it at a little dillance all around, forming a little band, which furrounds the ftone at al fimall dittance. When the filaments of water have paffid the body, they are pretled by the ambient flud in:o the place which it has quitted, and they glide rousd its tern, and fill up the fpace behind. The more divergent and the more tapid they are, when about to fall in behind, the more of the cir. cunambient preflua mat be employed to turn them into the trough behind the hody, and lefs of it will remain to prefs them to the body itfelf. The extreme of this mutt obtain when the fteam is offtruted by at thin plame only. But when there is fome diftance between the prow and the poor, the diverge::cy of the filaments which had been tumed ative by the prow, is diminifhed by the time that they have come abrealt of the ftern, and fhould turn in behind it. "They are therefore more seadily made to converge behind the bodr, and a more confiderable part of the furrounding prefiure remains unexpended, and therefore prefles the water again? the ftern; and it is evident that this advantage muft be fo much the grenter as the body is longer. But the advantage will foon be fuiceptible of no very confiderable increafe: for the lateral and divergent, and accelerated flaments, will foon become fu nearly parallel and equally rapid with the reft of the Aream, that a great increafe of length will not make any conflderable change in thele particulars ; and it mult be accompanied with an increafe of friction.

Thete are very obvious reflections. And if we attend minutely to the way in which the almolk flagnant fluid behind the body is expended and renewed, we thall fee all thefe effects contirmed and angmented. But as we cannot fay any thing on this lubjet that is precife, or that can be made the fubject of computation, it is needlefs to enter inso a more minute difcullion. The diminution of the non-prellure towards the centre moft probably arifes from the dimaller force which is neceflory to be expended in the inflection of the lateral filaments, already inflected in fome degree, and having their veloci:y dimmithed. But it is a fubjest highly deferving the attention of the mathernaticians; and we prefinme to invite them to the Itudy of the motions of thefc lateral filamen's, pafling the body, and preffed into its wake by fores whicl :re fulceptible of no difficult inveftigation. It feems highly probable that if a primatic box, with a fquare licrn, were fited with an addition precincly fhapred bike the water which would (abitacring tenacity and fricion) have been farnant behiad it, the quantity of non-jrefion would be the fmallell poliblc. '11: ruathematician would furely difcover circumblanes which wonld fumifh fome maxims of confluction for the hinder part as well as for the prow. And ats his fpeculations on this latt have not been wholly fioitlets, w. mes cxpeet advantages from his attention to this fart, mach nerglequ.

In the me:in time, let us attend to the deductions which Mr de Buat has made from his few experiments.
$\underbrace{\text { Refiftance. }}$
$\underbrace{\text { R }}$ r 1 -
 .
 :
$\qquad$
 : can bat perceive a few leading circumit mees.
The water is tarned afide by the anterior part of the body, and the velocity of the filaments is increafed, and they acquire a divergent motion, by which they allio pulla alide the fiursumbing water. On each fide of the indy, thereture, they are moving in a divergent direction, and with an incecafed velocity. But as they are on ail fides preffed by the fluid wihhont them, their montions gr.adualiy approach to parallelifm, and their velocitics to an eqn dity with the liream. 'Whe progref. five vel city, or that in the diration of the fream, is checked, at jeaft at firf. But fince we obfirve the filaments conltipated round the body, and that they are not deffected at sight antos to their former direction,

## RES

Refifance.
When the velocity is three feet per fecond, rcquiring the productive height $2.1,5$ lines, the heights correlponding to the non-preffure on the poop of a thin plane is 14,41 lines (taking in feveral circumfences of judicious correstion, which we have not mentioned), that of a foct cube is 5,83 , and that of a box of triple length is 3,31 .

Let $q$ exprefs the variable ratio of thefe to the height producung the velocity, fo that $q /$ may exprefs the nonpreffure in every cafe; we have,

$$
\begin{aligned}
& \text { For a thin plane } \\
& \begin{array}{l}
\text { a cube } \\
\text { a box }=3 \text { cubes }
\end{array}
\end{aligned}
$$

It is evident that the value of $q$ has a dependence on the proportion of the length, and the tranfverfe fection of the body. A feries of experiments on prifmatic bodies fhowed Mr de Buat that the deviation of the filaments was fimilar in timilar bodies, and that this obtained even in difimilar prifms, when the lengths were es the fquare-roots of the tranfverfe fections. Although theretore the experiments were not fufficiently numerous for deducing the precile law, it feemed not imporfible to cerive from them a very ufeful approximation. By a deaterous comparion he found, that if $l$ exprelfes the length of the primm, and s the area of the tranfverle fection, and L expreflies the common logarithm of the quantity to which it is prefired, we fhall exprefs the not.-preffure pretty accurately by the formula $\frac{1}{q}=$ L $\left(1,42 \frac{l}{\sqrt{ } s}\right)$.

Hence arifes an important remark, that when the height correfponding to the non-preffion is greater than $\checkmark / s$, and the body is little immeried in the fluid, there will be a void behind it. Thus a furface of a fquare inch, jult immerfed in a current of three feet per fecond, will have a vild behind it. A foot fquare will be in a limilar condition when the velocity is 12 feet.

We muft be carelul to d flinguifh this non-preffire from the other caules of refiltance, which are always neceffarily combined with it. It is fuperadditive to the active impreffion on the prow, to the fatical preffure of the accumulation a head of the body, the fatical preflure arifing from the depreffin $n$ behind it, the effeas of friction, and the effects of tenacity. It is indeed next to impofible to eflimate them feparately, and many of them are aftually combined in the meafures now given. Nothing can determine the pure non-prefiures till we can afcertain the motions of the flaments.

Mr de Buat here takes occafion to controvert the He coutro Mr de Buat here takes occation to controvert the
verts 2 univerfally adopted maxim, that the pieffure occafioned maxinuni- by a fre am of fluid on a nexed body is the fame with verfally acopted,

## RES

The ron-prefures increafed in a greater tatio than the Re fansice fquares of the velocities. The ratio of the vercisies to : frall velocity of $2 \frac{1}{5}$ inches fer fecond increaled genructi ically, the value of $q$ increafed arithmetically; and we may determine $q$ for any velocity $V$ by this proportic:
I. $\frac{55}{2,2}: \mathrm{L} \frac{\mathrm{V}}{22}=0,5: q$, and $q=\frac{\mathrm{L} \frac{\mathrm{V}}{2,2}}{2,8}$. Tlat is,
let the common logarithm of the valocity, divided by $2 \frac{1}{5}$, be conlidered as a common number; divide this common number by $2 \frac{8}{7 \sigma}$, the quotient is $q$, which mull be multiplied by the produlive height. The product is the prefliure.

When Pitht's tube was expofed to the fream, we had $m=1$; but when it is caried through fill water, $m$ is $=1,22$. When it was tumed from the flicam, we had $q=0,157$; but when carried through fill water, $g$ is $=0,138$. A remarkable expcriment.
When the tube was moved late: ally throught the wa- And fupter, fo that the motion was in the diretain of the plane perts his of its mouth, the non-prellure was $=1$. This is one opriuion by of his chief arguments for his theory of non-preffion. a reniatkHe does not give the detail of the experiment, and able expoo only inferts the refult in his table.

As a body expofed to a fleam deflects the fluid, heaps it up, and increafes its velocity; fo a body moved through a ftill fluid turns it alide, caues it to fwell up before it, and gives it a real motion alongfide of it int the oppofite direction. And as the body expofed to a ftream has a quantity of fluid almof fagnant both before and behind; fo a oody moved thruugh a ftill fuid carries before it and drags after it a quantity of lluid, which accompanies it with nearly an equal velocity. This addition to the quantity of matter in motion mult make a diminution of its velocity; and this forms a very coniderable part of the obferved reliftance.

We cann t, however, help remarking that it would require very diftinct and ftrong proof indeed to overturn the common opinion, which is founded on our mof certain and limple conceptions of motion, and on a law of nature to which we have never oberved an exception. Mr de Buat's experiments, tho' moft judicicunfy contrived, and executed with fcrupulous care, are by no means of this kind. They were, of abfolute neceffity, very complicated; and many circumatances, impofible to avoid or to appreciate, rendered the obfervation, or at leaft the comparifon, of the velocities, very uncertain.

We can fee but two circumflances which do not ad. 1 mit of an ealy or immediate compaifon in the two Itates of the problem. When a body is expofed to a Aream in cur experiments, in order to have an impulfe miade on it, there is a force tending to move the body backwards, independent of the real impulfe or preflure ia rumung ards, in or nit waoccafioned by the defeetion of the fream. We cann. $t$ ter. have a llream except in confequence of a lloping furface. Suppofe a body floating in this Aream. It wili not only lail down along with the fream, but it will tail down the firam, and will therefore go fafter along the canal than the Iteam does: for it is floating on an inclined plane; and if we examine it by the laws of hydroitatics, we fhail find, that befides its own tendency to fidd down this incline. plane, there is an odds of hydroltatical prelliure, which puffes it down this plane. It will therefure go along the canal fafter than the liream. For this accele:ation depends on the difference of preflure at the two ends, and will be mare re-

## R E S <br> [122] <br> に E S

$\underbrace{\text { Kecinance. markable as the hody is larger, and efpecially as it is }}$ longer. This may be diltinolly obfersad. All thoating bodies go into the itream of the river, bscaufe there they find the fimbllet obllrustion to the acquifition of this motion along the inclined planc; and when a number of bedies :ree thas tloating down the ftream, the l.argeft and longelt outhlrip the reft. A log of wood floating down in this manner may be obferved to make its way very filt among the chips and law-duft which float alonglite of it.

Now when, in the courfe of our ceperiments, a body is fupperted againt the attion of a ftream, and the impulte is meafured by the force employed to fupport it, it is plain that part of this furce is employed to aet againtt that tendency which the body has to outtrip the fre:m. This does not appear in our experiment, when we move a body with the velocity of this ftream through fill water having a horizontal furface.

The other dilkinguifhing circumftance is, that the recardations of a ftream arifing from fristion are found to be neally as the velocities. When, therefore, a Itream moving in a limited canal is checked by a body put in its waly, the diminution of velocity occalioned by the friction of the fream laving already produced its effea, the impulfe is not affected by it ; but when the body puts the fill water in motion, the friction of the bottom produces fonee effe?, by retarding the receis of the water. This, however, mult be next to nothing.

The chief difference will arife from its being almon impoffible to make an exate comparifon of the velocities: for when a body is moved againtt the Itream, the relative velocity is the fame in all the filaments. But when we expofe a body to a fiream, the velocity of the different filaments is not the fame; becaure it decreafes 19r Buat's Mr Buat found the total fenfible refiftance of a plate calcuation 12 inches fquare, and meafured, not by the height of of refih- water in the tube of the perforated box, but by weights atice.

And of the the refitances 14,$94 ; 12,22$; and $11,49 \cdot$
geantity of Hence Mr Buat concludes, that the refifances in wannity of thefe two fates are nearly in the ratio of 13 to 10. hering to a This, he thinks, will account for the difference obferiody move ved in the experiments of different authors.

Mr Buat next endeavours to afcertain the quantity or water which is made to adtere in fome degrec to a
body which is carried along thro' fill water, or which Refinanere, remains nearly flagnant in the midf of a Itream. He takes the fum of the motions in the direction of the Atream, viz. the fum of the actual motions of all thofe particles which have lof part of their motion, and he divides this fum by the general velocity of the fiream. The quotient is equivalent to a certain quantity of water perfectly flagnant round the body. Without being able to determine this with precifion, he obferves, that it augments as the refillance dminifhes; for in the cafe of a longer body, the filaments are obferved to converge to a greater diftance behind the body. The fagnant mals athead of the body is more conftant ; for the deflection and refiftance at the prow are obferved not to be affected by the length of the body. Mr Buat, by a very nice analyfis of many circumftances, comes to this conclufion, that the whole quantity of fluid, which in this manner accompanies the folid hody, remains the fame whatever is the velocity. He might have deduced it at once, from the confideration that the curves defcribed by the filaments are the fame in all velocitics.

He then relates a number of experiments made to afcertain the ablulute quantity thus made to acce mpany the body. Thefe were made by caufing pendulums to ofillate in fluids. Newton had determined the refiftances to fuch ofciliation by the diminution of the arches of vibration. Mr Buar determines the quantity of dragged fluid by the increafe of their duration; for this flagnation or dragging is in fact adding a quantity of matter to be moved, without any addition to the moving force. It was ingenioully obferved by Newton, that the time of ofcillation was not fenlibly affected by the refiftance of the fluid: a compenfation, almoft complete, being made by the diminution of the arches of vibration ; and experiment confirmed this. If, therefore, a great augmentation of the time of vibration be obferved, it mult be afcribed to the additional quantity of matter which is thus dragged into motion, and it may be employed for its meafurement. Thus, let $a$ be the length of a pendulum fwinging feconds in vacue, and I the length of a fecond's pendulum fwinging in a fluid. Let $p$ be the weight of the body in the fluid, and $P$ the weight of the Hluid difplaced by it; $P+p$ will exprefs its weight in vacuo, and $\frac{P+p}{P}$ will be the ratio of thefe weights. We fhall therefore have $\frac{P+p}{p}=$ $\frac{a}{l}$ and $l=\frac{a p}{P+p}$.

Let $\hat{n} \mathrm{P}$ exprefs the fum of the fluid difplaced, and the fluid dragged along, $n$ being a number greater than unity, to be determined by experiment. The mafs in motion is no longer $\mathrm{P}+p$, but $\mathrm{P}+n \mathrm{P}$, while its weight in the fluid is fill $p$. Therefore we mult have $l=\frac{a p}{n \mathrm{P}+p}=\frac{a}{n \mathrm{P}}+1$, and $n=\frac{p}{\mathrm{P}}\left(\frac{a}{\eta}-1\right)$.

A prodigious number of experiments made by Mr Buat on fplieres vibrating in water gave values of $n$, which were very conflant, namely, from 1,5 to 1,7 ; and by confidering the circumflances which accompanied the variations of $n$ (which he found to arife chiefly from the currature of the path deferibed by the

## RES [ [23 ] <br> R E S

Refifance, ball), he Atates the mean value of the number $n$ at 1,583 . So that a fphere in motion drags along with it auout $\frac{6}{20}$ of its own bulk of duid with a velocity equal to its own.
He made fimilar experiments with prifms, pyramids, and other bodies, and found a complete confirmation of his aflertion, that prifms of equal lengths and fections, though dirlimilar, dragged equal quantities of fluid; that fimilar prifms and prifms not fimilar, but whofe length were as the fquare-root of their fections, dragged quantities proportional to their bulks.

He found a general value of $n$ for prifmatic bodies, which alone may be confidered as a valuable truth; namely, that $n=0,705 \frac{\sqrt{ } / s}{l}+1,13$.

From all thefe circumftances, we fee an int:mate connection between the preffures, non-preffires, and the fluid dragged along with the body. Indeed this is immediately deducible from the firt principles; for what Mr Buat calls the dragged fuid is in faet a certain portion of the whole change of motion produced in the direction of the body's motion.

It was found, that with refpect to thin planes, fpheres, and pyramidal bodies of equal bafes, the refiftances were inverfely as the quantities of fluid dragged along.

The intelligent reader will readily oblerve, that thefe views of the Chevalier Buat are not fo much difcoveries of new principles as they are clafifications of confequences, which may all be deduced from the general principles employed by D'Alembert and other mathematicians. But they greatly affift us in forming notions of different parts of the procedure of nature in the mutual action of fluids and folids on each other. This mult be very acceptable in a fubject which it is by no means probable that we fhall be able to inveftigate with mathematical precifion. We have given an account of thefe laft obfervations, that we may omit nothing of confequence that has been written on the fubject; and we take this opportunity of recommending the Hydrauligue of Mr Buat as a moft ingenious work, containing more original, ingenious, and practically ufeful thoughts, than all the performances we have met with. His doctrine of the principle of uniform motion of fuids in pipes and open canals, will be of immenfe fervice to all engineers, and enable them to determine with fufficient precifion the mof important queftions in their profeffion; quefions which at prefent they are hardly able to guefs
at. See Rivers and Water-Works.
89
The only circumflance which we have not noticed in detail, is the change of reffitance produced by the void, or tendency to a void, which obtains behind the body; and we omitted a particular difcufion, metely becaufe we could fay nothing fufficiently precife on the fubject. Perfons not accultomed to the difcuffions in the plyyficomathematical fciences, are apt to entertain doubts or falfe notions connected with this circumftance, which we fhall attempt to remove; and with this we fhall conclude this long and unfatisfactory differtation.
90
Explained.
If a fluid were ferfectly incomprellible, and were contained in a veffel incapable of extention, it is impoffible that any yoid could be formed behind the body; and in this cafe it is not very ealy to lee how motion could be performed in it. A fphere moved in fuch a medium could not advance the imalleft diftance, unlefs fome partitles of the fluid, in filling up the fpace left by it, moved with` a. velocity'next to infinite. Some
degree of compreffibility, however fmall, feems necef- R:fitune: fary. If this be infenfible, it may be rigidly demonfrrated, that an external force of compreffion will mate no fonfible change in the internal motions, or in the refiftances. This indeed is not obvious, but is in immediate confequence of the quaquaverfum frefliure of fluids. As much as the preffure is angmented by the external compreffions on one fide of a body, fo much it is ang. mented on the other fide ; and the fame nult be faid of every particle. Nothing mure is neceffary for fecuritg the fame motions by the fame partial and internal forces; and this is fully verified by expariment. Water remains equally fluid under any compreffions. In fome of Sir Ifaac Newton's experiments balls of four inche; diameter were made fo light as to preponderate in water only three grains. Thefe balls defcended in the fame manner as they would have defcended in a fuid where the refiltance was equal in every part; yet, whem they were near the bottom of a veffel nine feet ceep, the compreffion round them was at laft 2400 times the moving force; whereas, when near the top of the veffel, it was not above 50 or 60 times.

But on a fluid fenfibly comprefible, or which is not confined, a void may be left behind the body. Its motion nas be fo fwift that the furrounding preffure may not fuffice for filling up the deferted fpace; and, in this cafe, a fatical preffure will be added to the refiftance. This may be the cafe in a veffel or pond of water having an open furface expofed to the finite or linited preffure of the atmofphere. The queftion now is, whether the refiftance will be increafed by an increafe of external preffure? Suppofing a fphere moving near the furface of water, and another moving equally faft at four times the depth. If the notion be fo fwift that a void is formed in both cafes, there is no doubt but that the fphere which moves at the greateft depth is mort refifted by the preffure of the water. If there is no void in either cafe, then, becaufe the quadruple depth would caufe the water to flow in with only a double relocity, it would feem that the refiftance would be greater; and indeed the water flowing in la erally with a double velocits produces a quadruple non-preffure.But, on the other hand, the preffure at a fmall depth may be infufficient for preventing a void, while that below effectually prevents it; and this was obferved in fome experiments of Chevalier de Borda. The effect, therefore, of greater immerfion, or of greater compreffion, in an elaitic fluid, does not follow a precife ratio of the preflure, but depends partly on abfulute quantities. It cannot, therefore, be ftated by any very fimple formula what increafe or diminution of refiftance will refult from a greater depth; and it is chiefly on this account that experiments made with models of fhips and mills are not conclufive with refpect to the performance of a large machine of the fame proportions, without correations, fometimes pretty intricate. We affert, however, with great confidence, that this is of all methou's the moft exatt, and infinitely more certain than any thing that can be deduced from the moft elaborate calculation from theory. If the refiftances at all depths be equal, the proportionality of the total refiftance to the body is exact, and perfectly conformable to obfervation. It is only in great velocities where the depth has any material influence, and the influence is not ne.rr fo confiderable as we fhould, at firlt fight, fuppofe; for, in eftimating the effect of immerfion, which has a relation

R chance to the difference of prelfire, we mun slways take in the perlure of the a!mofipere; and thus the prefiure at 33 feet deep is not 33 times the preflure at one fwor elcep, but onl) dauble, (or twice as great. The atmoifheric pruture is cmitted only when the refifted plane is at the very furface. D'UHO, in his Examino Marifima, has introduced an equation exprefing this reliotion; but, cacent with very limted conditions, it will millad us prodigisully. To give a gencral nution of its foundation, let AB (fig. 23.) be the rection of a flate nuwing through a fluid in the direation $C D$, wh a known velocity. The tluid will be heaped up belore it above its natural level CD, becaufe the water will not le puhed betore it like a folid body, but will be puthed dide. A.d it cannot aequire a hateral motion ally nther way than by ala accumulation, which will diffufe itfelf in ail diretions by the hav of unduhtory motion. The water will alfo be left lower behind the plane, becaufe tirre $m \rho$ elapfe before the prellure of the water helind can make it fill the fpace. We may a:quire finse notinn of the extent of $b$ the accumulaton and deprcfition in this way. There is a certain depth CF ( $=\frac{q^{2}}{29}$, where : is the velocity, and o the accelerating power of graviry) under the fiuface, fuch th.t water would how thenugh a hole at $F$ with the velocity of the plane's motion. Draw a horizontal line FG. The water with certainly touch the plane in $G$, and we may furpofe that it touches it no higher up. The efore there will be a hollow, fuch as CGE. The elevation HE will be regulated by cenfiderations nearly fimilar. E1) nual be equal to the elocit, (f the plane, and HE mult be its productive height. Thus, if the velocity of the plane be one frot per fecond, HE and EG will he ${ }^{\frac{3}{6}}$ (f an inch. This is fufficient (though netextet) for giving us a notion of the thing. We fee that from this muft arife a preflure in the direction DC, viz. the preffure of the wholc column IfG.
Something of the fame kind vill happen although the plane $A B$ be wholly immerged, and this even to fom deph. We fee fuch alleviations in a fwift running Itreanl, where there are large fones at the tottom.This occations an excefs of pretfure in the direction opjofite to the plane's motion; and we fee that there muf, in every cale, be a relati n between the velocity and th. sexce is of preffure. This D'Ulla exprefies by an equation. But it is very ciceprionable, not tahing pr ferly into the account the comparative facility with which the water can heap up and diffure itfllf. It muft always heap up till it acquines a fufficint head of water to produce a literal and progrellive diffufion fufficient for the purpote. Is is evident, that a fmaller elevation will fuffice then the body is more immerfed, becaufe the check or inrpulfe given by the bodj below is proparated, ant vertically inly, hut in every direction; and therefore the exaration is not confined to that part of the furface which is immediately above the moving body, but extends for much farther laterally as the centre of agitation is deeper: Thus, the elevation necellary for the pafage of the hody is fo much maller; and it is the figigt only of this accumulation or wave which de:ermines the backward preflure on the body. D'Uiloa's equation may happen to quadrate with two experiments at different depths, without beine neauly jult; for any two poins may be in a curve, without cxhibiting its
equation. Three points will do it with fume appronch Reffanie. to precifion: but four, at leaf, are necelfary for giving any notion of its nature. D'Unl a has oaly given two experiments, which we mentioned in another plice.

We may here oblerve, that it is this circumilance which immedia ely produces the great refiflance to the motion of a body through a fluid in a narruw canalThe fluid cannot pafs the body, unlefs thee area of the fection be fufficiently extenfive. A nurrow canal prevents the extention lidewife. Tise water mult therefore he:p up, till the fection and velocity of diffation are fufficiently enlarged, and thus a great bickwarul prelfure is produced. (See the fecond feries of Experiments by the Fiench Academicians; fee alfo Franklin's Elfays.) It is important, and will be confidered in another place.

Tuus have we attempted to give our readers fome account of ore of the mofl interefting pr. Hems in the whe le of mechanic al plitofophy. We are firry that fo litule advantage con be derived from the united efforts of the fint mathomatic:ans of Eur pe, and that there is fo litele hape of geatly improvig g our fcient fic knowledge of the fubjoct. What we lave dectivered will, however, enalle our reade's to peruic the watings of those who have applied the the ries to prastical purpores. Such, for infance, are the treat fes of J hn Bernoulli, of Dougura, and of Euler, an the conltrucion and worting of this and the occafienal diferta-w tions diffue i . application the or linary thenry is not without its value, for the im, ulfes ate nearly perpendicular; in which eafe they do not mate:ially deviate from the duplicate propertion of the fine of incidence. But even here this theory, applied as it communly is, mifleads us exceedingly. The impulfe on one float may be accurately enough ftated by it ; but the authors have not been attentive to the motion of the waer after it has made its impulfe; and the impulfe on the next float is fated the fame as if the parallel fildments of water, which were not flopped by the preceding float, did impinge on the oppolite part of the fecond, in the fame manner, and with the fame obliquity and energy, as if it were dctached from the refl. But this does not in the lealt refemble the ral procefs of nature

Suppofe the floats B, C, D, H (fig. 24.) of a wheel immerfed in a fream whofe furface moves in the dircction AK , and that this furface meets the float B in E . The part BE alone is fuppofed to be impelled; whereas the water, chceked by the float, heaps up on it to e.Then drawing the horizontal line I3F, the part CF of the next float is fuppofed to be all that is impelled by the parallel filaments of the ftream; whereas the water bends round the lower edge of the float $B$ by the furronnding preffure, and rifes on the float $c$ all the way to $f$. In like manner, the float $D$, inftead of receiving an inpulfe on the very fmall portion DG, is impelled all the way from 1 to g , not much below the furlace of the fleam. The du:faces impelled at nnee, therefure, greatly exceed wiat this Ilovenly application of the theory fuppodes, and the whole impulfe is much greater; but this is a fault in the a plication, and not in the theory. It will not be a very diflicult thing to acquire a knowledge of the motion of the water which has paffed the preceding float, which, though no accurate, will yot approximate confiderably to the truth; and
tbra

Refolation then the ordinary theory will furnifh max:ms of conftruction which will be very ferviceable. This will be Relpira- attempted in its proper place; and we fhall endeavour, $\underbrace{\text { tion. }}$ in our treatment of all the practical queftions, to derive uleful infurmation from all that has been deliveted on the prefent occation.

RESOLUTiON of Ideas. Sce Logic, Part I. ch. 3.
Resolution, in mufic .To r.folve a difcord or diifonance, fiys Ronfeath, is to carry it according to rule into a confonance in the fubfequent chord. There is for that purpole a prucedure prefiribed, both for the fundamental bats of the diffenant chord, and for the part by which the diffonance is formel.

Thase is no poffible mauner of refolving a diffonance which is not derived from an operation of cadence: it is then by the kind of cadence which we wifh to form, that the motion of the fundamental bals is determined, (fee Cadence). With reipect to the part by which the dillonance is formed, it ought neither to continue in its place, nor to move by disjointed gradations; but to rite or defcend diatonically, accordi $g$ to the nature of the diffonance. Theoritts fay, that major diffonances ourht to rife, and minor to defcend; which is not however without exception, lince in particular chords of harmony, a Jeventh, although major, ought not to rife, but to defcend, unlefs in that chord which is, very incoirectly, called the chord of the feventh redundant. It is better then to fay, that the feventh and all its derivative diffonances ought to defcend; and that the fixth fuperadded, and all its derivative diffonances, thould rife. This is a rule truly general, and without any cxception. It is the fame cafe with the rule of refulving diffonances. There are fome difforances which cannct be prepared; but there is br no means one which ought not to be remilved.

With rufpect to the feifible note, improperly cailed a major diflonance, it it ought to afcend, this is lets on account of the rule for re olving difonances, than in account of that which preferibes a diatenic procedure, and piefers the thortelf road; and in reality, there are cales, as that of the interrupted cadence, in which this fenfible note does $n t$ afeen. .

In chords by fuppoti:ion, one fingle chord often produces two diffonances; as the feventh and ninth, the ninth and fourth, \&c. Ther, there two diffonances ought to have been prepared, and buth mult likewife be refolved; it is becaufe regard fhould be paid to every thing which is difcordant, not only in the fun-dam-ntal, but even in the c.ntinued bals.

Resolution, in chemiftry, the reduction of a mixed body into its component parts or firit principles, as far as can be done by a proper amalyns.

Resolution, in medicine, the difappeasing of any tumor without coming to fuppuration or forming an abfcefs.

RESOLVENTS, in medicine, finch as are proper for dillipat'ng tumors, without allowing them to come to fuppuration.

RESONANCE, Resounding, in mufic, Eic. a found returned by the air inclofed in the bodies of Aringed inftruments, fuch as luies, \&c. or even in the bodies of wind-inftruments, as fiuts, Eic.

RESPIRATION, the act of refpiring or breathing the air. Sec Anatomy, $\mathrm{n}^{\circ}$ 113. Blood, $\mathrm{n}^{\circ}$ 29. ME*
dicine, $n^{0}$ 104. Physiology, Sect. I. and Putrepacition fafim.

RESPITE, in law, fignifies a delay, forbearance, or prolongation of time, granted to any one for the payment of a debt, or the like. See Reprieve.

RESPONDENT, in the fitools, one who maintains a thefis in any art or fciencc ; who is thus called from his being to anfwer all the objections propofed by the opponent.

RESPONDENTIA. See Bottomrỳ.
RESPONSE, an anfwer or reply. A word chiefy ufed in fpeaking of the aniwers made by the people to the prieft, in the litany, the pfalms, \&c.

RESSORT, a French word, fometimes ufed by En. glith authors to fignify the jurifdiction of a court, and particularly one from which there is no appeal.- Thus it is faid, that the Britith houfe of lords judge en dernier orfort, or in the late reffort.

REST, the continuance of a body in the fame piace, or its continual application or contiguity to the fame parts of the ambient or contiguous bodies; and therefore is oppofed to motion. See the article Motion.
RESt, in poetry, is a fhort paufe of the voice in reading, being the fame with $t$ ic cafura, which, in Alexandrine verfes, falls on the fixth fyllable; but int ve:fes of 10 or it fyllables, on the fourth. See Portry, Part III.
REST-HARROW, or Cammock, the Ononis Arvonfis. A decostion of this plant has been much recommended to horfes labouring under a foppage of urine. It is the pelt of fome corn-fields; but in its younger Itate, before the plant has acquired its thorns, it is a molt acceptable rood to theep.
RESTAURAIION, the act of re-eftablifhing or fetting a thing or perion in its former good itate.

RESTIO, in botany; a genus of the triandria order, belonging to the diweci, clafs of plants. The male calyx is an ovate fike of membranaceous fcales; the corolla is proper, heapaptalous, and perfiftent. The female calyx and corolia are as in the male; the germen is roundift, and fex-fulcated ; there are three erect and perfiftent Ityles; the captule is roundith, with fix p!aits, and is roftrated and trilocular ; the fecds are oblong and cylindrical.

RESTITUTION, in a moral and legal fenfe, is refloring a perfon to his right, or returning fomething unjullly taken or detained from him.

Restirution of AIeduls, or Reflituted Medals, is a term uled by antiquaries for fuch medals as were ltruck by the cmperors, to cetrieve the memory of their predecelfors.

Hence, in feveral medals, we find the letters rest. This pratice was firt begua by Claudius, by his fliking afrefh Jev ral melals of Augulluc. Nero did the fame; and Titus, after his father's cxample, ttruck re. flitutions of moft of his precleceflors. Gallienus ftruck a general reftitution of all the preceding emperors on two medals; the onc beariug an altar, the other an eagle, without the REsT.

RESTIVE, or Resty, in the maneerc, a ftublorn, unruly, ill broken horfe, that fops, or rens back, infead of admancing forward.

RESURRECTION，in theology．is a riiling again from the flate of the dead；and is that event，the be－ lief of which conftitutes oree of the principal articles in the Chritian creed．
In treating of this object of our faith，it has been ufual to mencion，firlt，the refurrection of our Bleffed Lord，with the charater of the witnefles，and the au－ thenticity of the gofpel hiftory by which it has been proved，and from which，as a confequence，ours is in－ ferred．But as mult of the arguments for his refurrec－ tion are contained in the gofpels，and as merely to re－ peat them would afford，we hope，bnt little informa－ tion to molt of our readers，we mean here to take a vieu of the feveral grounds on which the belief of a luture exifence is fuppofed to be founded；to collect together fome of the lentiments of authors and nations concerning the place where departed fpirits refide ；con－ cerning the nature of their prefent ftate；concerning the kinds of their future detination ；that we may af－ terwards fee how far their notions differ and agree with what we confider as the doetrines of Scripture．

Of a future flate，there have fometimes been found a few wandering and obfcure tribes who feemed to enter－ tain no notion at all；though it fhould be remarked，that fome of the fe were likewife nbferved in folow a degree of favage barbarity as not to be acquainted with the ufe of the bow，the dart，or the fling，and as not knowing how to wield a club，or to throw a flone， as a weapon of defence＊．

Wherever the humau mind has been cultivated，or properly fpeaking，begun to be cul：ivated，the opinion has likewite generally prevailed that human exiftence is not confined to the prefent fcene；nay，fo very gene－ $r_{s} l$ lads this motion been found among mankind，that many are puzzled how to account for what they fuppofe to be almoft next to its utiverfality．
To explain the phenomenon，fome have imagined that it is a noticu derived by thadition from primeval re－ velation．They fuppofe that the firft parent of man． kind，as a mord agent accountable for his conduet，was informed by his Maker of every thing which it was uf importance for lim to know；that lie muf have heen acquainted with this doctrine of atuture ttate in parti－ cular ；and that be could hardly fail to communicate a
matter fo interefing to his poferity．They furpofe，Refurrece too，that the hiftory of the trandation of Enich muft rinn． have made a grea：noite in the wolld，and that the re． membrance of it mut have been long retained and widely diffufed；and they find in the bonk of Job plain intimations of a refurrection from the dead，which，from the manner in which they are introduced，they think that very ancient patriarch mutt have received through this channel．

It is not thought to be any objection to thef fuppo．The ufual fitions，that the Moft Iligh，when delivering his laws ohjections from the top of Mount Sinai，did not enfurce them by the awful fanctions of a future flate．The inteligent no forco of reader of the Scriptures knows that the fanctions of a future fate belong to a different and more univerfal dif． pentation than was that of Mofes；that the primeval revelation related to that difpenfation；and that the Jewith law，with its temporal fanttions，was introduced only to preferve the knowledge and worlhip of the true God among a penple too grofs in their conceptions to have been properly influenced by the view of future re－ wards and punithments，of fuch a nature as eye lath not leen，nor ear heard，meither hath it entered into the heart of man to conccive．He fees at the fame time， everywhere icattered through the Old Teftament，plain indications of the Mofaic economy，being no mure than preparatory to the bringing in of a better hope；and he thinks it evident，that fuch Jews as underftood any thing of the nature of that better hope，wu！t have been convinced，that，however the ceremonial rites of their religion might be lufficiently guarded by temporal fanc－ tions，the fundamental principles of all religion and virtue are fupported by rewards and punifhments to be difpen－ fed in a flate beyond the grave．See Prophecy and Theology．

That the progenitors of the human race mun hare Reafons in been inipired by their Creator with the knowledge of fupport of their iminortality，and of every thing neceffary to their the upi－ everlalling welfare，cannot，we fhould think，be quef nion． tioned by any one who believes that the world had 2 beginning，and that it is under the government of goud． nefs and jultice．The progrefs from fenfe to fcience is fo flow，that however capable we may fuppofe the ear－ lieft inhabitants of this earth to have been of making philofophical difcoveries，we cannot believe that the Fa－ ther of mercies left his helplefs creature to difcover for himfelf his future exiftence．Death，when nirlt pre－ fented to him，munt have been a ghaftly object；and had he been left without any hope of redemption from it，he would undoubtedly have funk into liftlefs defpondency．

But a profect of immortality is fo plealing to the human mind，that if it was communicated to the firt man，it would of courfe be cherilhed by his polteri－ ty ；and there is no difficulty in conceiving how it might be handed down by tradition to very remote ages， among luch of his defiendents as were not feattered over the face of the earth in fmall and favage tribes．－ In the couric of its progrefs，it would frequently be new－modelled by the ever active imagination ；and at laft many abfurd and fantallic circuniftances would doubtels be combined with the origimal truth，that death puts nut an end to human exiftence．

But though we are firmly convinced that the firf principles of ufetul knowledge，and among them the doctrine of a future llate，were communicated to man

## R E S

Mefurrec-
tion. $\underbrace{\text { tion. }}$
by his Maker ; and though this doctrine, in large and permanent focieties, might certainly be conveyed more or lefs pure to late pofterity through the channel of tra-dition-we are far from attributing fo much to tradition as fome writers are difpofed to do, or thinking it the only fource from which mankind could derive the belief of their exiftence beyond the grave. In fmall tribes of favages fuch a tradition could hardly be preferved; and yet fome indiftinet notions of a future thate have been tound among tribes who are faid to have loft all traditionary notions even of the being of a God.

Others, therefore, are inclined to believe that, independent of any traditions, mankind might be led by certain phenomena to form fome conjectures of a future ftate. They obferve, that although a few individuals perhaps may, yet it feldum happens that the whole individuals of any nation are exempted from dreaming: They obferve, too, and this obfervation is founded on experience, that the images of the dead are from the remaining impreflions of memory frequently fummoned up in the fancy; and that it appears from all the languages of rude nations, who pay the greatelt attention to their dreams, and who feeak of feeing the dead in their vifions, that thefe images ( $A$ ) have always been taken by them for realities; nay, fume of the learned, and the celebrated Baxter is of the number, are difpofed to doubt whether thefe appearances be not fomething more than illufions of the brain : But whether they really be fo or nor, one thing is certain, that all nations in all countries, in the darkeft ages and the rudeft periods, are accuftomed to dream; and whether fleeping or waking, in the ftillnefs of the night, in the gloom of folitude, in the fondnefs of friendihip, in the rovings of love, the delirium of fever, and the anguifh of remorfe, to fee and converfe with the fhades of the departed; and Lucretius * has remarked, that even the inferior animals are not exempted from fuch illulions of a refleis fancy.

For often fleeping racers pant and fiweat, Breathe fhort, as if they ran their fecond heat; As if the barrier down with eager pace They Aretch'd, as when contending for the race. And often licurds, when fleep hath clos'd their eyes, They tofs, and tumble, and attempt to rife; They open often, often fnuff the air, As if they preft the footleps of the deer ; And fometimes wak'd, purfue their fancy'd prey, The fancy'd deer, that feem to run away, Till quite awak'd, the followed fhapes decay. And fofter curs, that lie and fleep at home, Do often roufe, and walk about the room, And bark, as if they faw fome frangers come.
And birds will fart, and feek the woods, by night,
Whene'er the fancy'd hawk appears in fight,
Whene'er they fee his wing or hear him fight. Creech.
Thefe powers of fancy extend wide over animal crea-

## RES

tion; and it is on this general principle that necromancers and dreamers have in all ages eftablifhed their trade, that the fories of goblins have at all times fo very eafily procured belief, and that

> The village matron, round the blazing hearth, Sufpends the infant audience with her tales, Breathing afonifhment! Of witching rhymes And evil pipirits; of the deathbed call Of him who robb'd the widow and devour'd The orphan's portion ; of unquiet fouls Ris'n from the grave to eafe the heavy guilt Of deeds in life conceal'd; of Chapes that walk At dead of night, and clank their chains, and wave The torch of hell around the murderer's head. Aikenstde.
Mankind in general would willingly difpenfe with thefe troublefome vifits of the dead. To prevent the return of the zumbi or the ghoft, fome nations of Africa ufe many fuperftitious rites*; and Kolben tells us, * Voyage that the frighted Hottentots leave in the hut where a to Congo perfon has died all the utenfils and furniture, left the and Ango. angry ghoft, incenfed at their avarice, fhould haunt them in their dreams, and infeft them in the night. Divines and moralitts have laboured to fhow that thefe are merely imaginary terrors: but God and nature feem to have determined that they fha! produce the fame effects upon certain minds as if they were real; and that while there is any fenfibility in the heart, while there is any remembrance of the pait, and any conjuring power in the fancy; the ignorant, the benighted, the timid, fhall often meet with the goblins of darknefs, the fipeares of the tomb, the apparitions that hover round the grave, and the forms of the dead in the midnight dream. See Spectre.

From thefe phenomena, which have been fo common Proballe in all countries and in all ages, what would mankind iuferences naturally infer? Would they not infer, that there is from fomething in the nature of man that furvives death, and dreams, that there is a future fate of exiftence beynd the grave? Are not fill many fpecimens of this reafoning preferved in the ancient poets? and is it not thus that A hilles $\dagger$ reafons after imagining that he faw the gholt $\dagger$ Hom. of his friend Patroclus?
'Tis true, 'tis certain, man, though dead, retains
Part of himfelf; the immortal mind remains:
The form fubbifts without the body's aid,
Aerial iemblance, and an empty fhade.
This night my friend, fo late in battle lolt,
Stood at my fide a penfive plaintive ghoft;
Ev'n now familiar as in life he came,
Alas! how diff'rent, yet how like the fame. Pope.
Lucretius *, a ftudious obferver of nature, though * Lib. z* no friend to the foul's immortality, acknowledges frankly that thefe phantoms often terrify the mind, haunt us in our fleep, and meet us while awake. He confeffes, too, that by fuch appearances mankind have been led
(A) There images were called by the Greeks Eidwna ©overwi ; and among the Romans they had various names, as umbra, lemures, manes, larva, and were fometimes called occurfacula nonium, buforum formidanina, fefulibro rum terriculamenta, animice errantes, which are all comprehended under the fpesies zortuerum,

The any fonl, as when we ate awake, Thith thoke to lively, that we thins we view Tre abient dead, and hink the inage true.

Crefch.
We here fee how the beicf of the icul's immortality *ame to be gencral among mankind. But for this infismation we are nuch more indebted to the poets, vwho bre given us faithiuitrancripts of nature, than to the glal fophers who have wilhed to entertain us with their own theories, or to thofe labrious men of crudition, who bive dreaded as much to examine the 11 fource of an ancient report as the friends of Ulytres .o Frlly of al-approach the coatt of Cimmerian darknefs. With lowing too them tradition is the ultimate houndary of refearch much to and as gorgons, chimeras, and hydras, have come duwn - ativen. to us by tridit on; fo they, with great fagacity, furpest, that tradition mult lidewife be at the bitt $m$ of the foul's immortality, and occafion the vifions and phantoms of the dead.
' Co tradition we have allowed all that it can juftly claim ; but we cannot alluw it to be the mly fource of this opinion: and we have felt the highet indign tion upon hearing men of learning and genius affirm, from a lalie zeal for the honour of revelation, that mankind, wihnut this influction, could never have acquired the art of building huts to fereen them from the cold, or have larned the method of propagating their fpecies! Tlle teader muff not here fuppule that we allude to Polydore Virgil (B). We have in our eye ferfons now alive, $1 \mathrm{i} h$ whom we have converfod on the fubject, and who (trrified at the length to which fome phil:fophers have cartied the doctine of intinots, and others the reafoning powers of the mind) have contended, with the atmolt earneftners, that we know nuthing-not even the fundtions of our znimal nature-but by tradi. tion or written revelation.

12

Having now feen the fource of the opinion concerning the future exiltence of the foul, and pointed ont the natural phenomena by which mameind were led to cmbare it, we come next to revicw the arduments by which the philufoners attempted to confirm it.

Pythagoras beieved, with the rent of hisceuntry, that annilahaton was neve: the ent, and that nonentity was never the beginnug, of any thing that io. His goteral dostire upern this tubject was thastly capeffed it very
 leamed from Eigyptianprefts that the foul migrates into new bodies; and being, it feems, a perfon of a molt extraoldinary and atonithing memory, he found there was fome truth in the floty: ior after nufing, he began to remmber that he was Euphorbus, the ton of Palltheus, that was fatin by Menelaus in the 'I'rojan wiar ; and upon a jaunt to Peleponnefus, recollected the thelel which he had worn at the time of the fiege, in one of the temples of Juno at Argos! That none might queftion the truth of his affertion, his followers prefently removed all doubis by the famous argument, the 185: bixir of Egyptidn origin.

As Py thagoras tarlat that human fouls are frequently thrult imto brute thapes, and, as $f$ me irnagined, by way of punifhment; it occurred to Plato, that all bodies, even the human, are a fort of prifons; and that, in confequence of this confinement, the foul was fubjected to the tage of defire, appctite, and pafion, and to all the wretched miferies of a jail. To explain this myAtery, he fuppofed that defires and appetites belong to afoul that is purely animal reftuing in the body. But he was perplesed with anolher difficulty; for as he thought highly of the goodnefs of Deity, he could not imagit e how the fhould imprifon us without a crime. He fuppoled, therefore, that prior to its union with the prefent body, the foul had exifted in one of cther, which it llill retains ; but that even in this etherial body it had felt comething of impure defire; and happening to indulge the vicious appetite, had contracted fome ftains of pollution, for which it was confined in its prefent body as a houle of correction to do penance and improve its morals.

To prove this ideal preexiftence of the fonl, Plato And mied availed himfell of in prin that weneral his time, that coincided with the doctrines of Pythagoras, and that was par!ly founded on a fort of reatoning and obfervation. He thought that matter and intelligence are coeternal (fee Platonism) ; that there are various orders of fouls; that thofe of both the man and the binte are palts or emanations (c) of the anima mund or foul of the world; that all are ultimately parts or emanations of Deity tielf; and that all their faculties are more or lefs reftricted and conlined, according to thofe organifed fyllems with which they are conneded. Know firt (days one delivering his dochines),

Know tirlt, that heav'n and earth's compated frame, And flowing waters, and the fary fame, And both the radia it lizhts, one common foul Infires, and feeds, and animates, the whole.
(B This writer alnot past of a chapter to fhow, "Quis primum inflituerit artem meretrician," as being, in his opin:oul, at traditionals practice. Sue Lib. iii. cap. 17. De Rerum Inventoribus.
(c) The Dei:y was che eiral by the ancien's fometimes as a folic, when i: ferior fonls were called

 whe, without flowing back as tiev ough: to have done, and ming ing with the great occan of firit.

Refurrec. tion.

This active mind, infus'd through all the fpace, Unites and mingles with the mighty mats: Hence men and beafts the breath of life obtaia, And birds of air, and monfters of the main; The ethereal vigour is in all the fame, And every foul is fili'd with equal liame; As much as earthy liz.us, and grofs allay Of mortal members, fnbject to decay, Blunt not the beams of heav'n and cdge of day (D). S Dryden.
Befides this hypothefis, that in fome meafure was common to others, Plato had an argument peculiarly his own. Happening to peep into the region of metaphyfics, he was fomewhat furpuifed on oblerving the id as wh:ch we derive from reflection and confcionifnefs; and fuppoting that they could not have entered by the feales, he naturally, though not very jufly, concluded, that we mult have received them in fome flate of prior exiftence.

As, according to him, the foul was eternal, as well as the matter which compored the body, and as their union was only temporary and accidental, be might have been fatisfied that the death of the foul was not to be the confequence of their feparation. But, fome how or other, fatisfied he was not. He had recourfe to a new argument. As the foul, he faid, was an active principle, and a felf-moving, it did not depend for its life on another; and therefore would always continue to exif, though the body were reduced to the general mafs out of which it was formed. See Metaphysics, Part III. chap. iv.

Whether Plato had borrowed any of his doetrines from the eaftern magi, we pretend not to fay. We only obferve a ftriking fimilarity, in fome refpects, between his and theirs. In Plato's philofophy, the fun, moon, and Atars, were animated beings, and a fort of divinities that originally had fprung from the great fountain of heat and light, and our earthly bodies a furt of dungeons in which our miferable fonls are benighted and debafed by defires, appetites, and paffions. In the magian philofophy, the Supreme Being was called Oromafdes; was the god of light, or was light itfelf, and reprefented by Mithras, a fubordinate divinity, and the fame with the fun. Another deity of very great power was Arimanes, the god of darknefs, who prefided over matter, and was the origin of all evil (fee Polytheism).

Vox. XVI.

The ancient Gnalics, who derived their tenets from Refurrec this Surce, believed, with Pythagoras and Plato, in a $\underbrace{\text { tien. }}$ g'ent number of fubordinate genii; and faid, that Demingus, the gud of mitter and the foul or fpirit of this would, hadcontived the bodies of men and brutes; and in the former particularly, as in fo many prifons, had confined a number of celeftidl foirits, that by expofing them to the low defires of appetite and paffion, be might feduce then from their allegiance to the God of light, and render them more fibmifive to himfelf. Irom thefe prifons the Supreme Being was continually naking attempts to refcue them; and in the mean tirae was frecuently fending divine meffengers to enlighten and intruct them, and to render them capable of re:urning to the regions of light and happinels, to which they had $b=1$ onged ( E ).

The Stoics attempted to fimplify this fyfem, which appears anciently to have pervaded Eyyptand the ealt, and which would feem to be no more than varioull modified by Orpheus, Psthagoras, Plato, and others of the more northerly and weftern nations. None of them allowed a creation out of nothing; and the fhaping and modelling of matter into forms was varioufly explained, according as they happened to be moft addicted to fuperllition, to morals, or to phyfics. Some afcribed thefe operations to ancient Time, Chaos, and Darknefs, and explained the future changes in nature by the genealugies of thefe deities; fome obferving attraction and repulfion, or at leaft a fort of agreement and difcordance among bodies, were inclined to afcribe thern to Friendihip and Hatred, or Love and Antipathy; fome obferving, that while one body rofe another defcended, made Levity and Gravity primary agents; and fome taking notice that living bodies fprung from corruption, were difpofed to confer the fame powers on Moifture and Heat.
The phyfical hypothefes were what had moit charms ofth for the Stoics. From their fyftem immaterial beings Stoice. were openly excluded; all things were regulated by phyfical laws or inexorable fate; and all things originated in the To 'Ey or the Firft One, which was probably fuggefted by the movas of Pythagoras. This $\mathrm{T}_{0} \oint_{\text {Ey }}$ appears to have been a materia prima devoid of all the qualities of body. In their language it was an Apxn or firf principle, not fubject to change. When it was invelled with the properties of body, it then became R
a $\Sigma$ тor.
(D) The general doctrine, as delivered here in thefe verfes of Virgil, is the fime with that not only of Pythagoras, but of the Stoics.
(E) Plato made the fars the native refidence of inferior fouls; and when thefe were thoroughly purified below, returned them home again: and therefore, fays Virgil, alluding to his doctrine,

Some have taught
That bees have portions of ethereal tliought, Endu'd with particles of heav'nly fires;
For God the whole created mafs infpires:
Thro' heav'n, and earth, and ocean's depth, he throvis
His influence round, and kindles as he goes.
Hence flocks, and herds, and men, and beafts, and fowls,
With breath are quicken'd, and attract their fouls :
Hence take the forms his prefcience did ordain,
And into binn at length refolue again.
No room is left for death, they mount the fk y ,
And to their own congenial planetsfly. Digdere
R.furses- a 5 raid io: or an ch.nent; and then, fo f.ir as refpected tion. its qualitics, efpecially its fonms, it varas iubject to changes almont perpetual. The gods thenielves and the fouls of mell were in this ly: fem only modifications of mater (1). Mall was compofed of their tour elements, Fire, dir, Whater, and Earth; and upondinolution, every putt returned th the element fiom which it had come, as the water of a velfel fixmming in the fea unites with the oce..In when the vefiel is broken. This fiftem, it is plain, cannot ponibly admit of any feparate confenumefs of exiftuce ( $G$ ). The fame may be faid of the fyitenis of 1)emocrates and Epicurus, and all thofe what undetomek to cxplain things upon phytical principles (11). The chief merit of the plyfical fyllems appears to be this: Abilurd as they were, it would feem from the whimite:l and the almoft childith reafoning of Lacretius, that they had a tendency to lead mankind from extruagant hypothefes to fome- and others. 1ate ingenious Mr Hunter. According to him, the living principle refides in the blood. This opinion, which is mentioned by Mofcs, was adopted by Critias and others of the ancients. Harvey likewife embraced it. But Mr Hunter, who always wifted to be thought an original, inclines to fland at the he:ud of the opinion, and furports it by experiments timilar to thofe of the famed Taliacotins in mending nofes. Should any of our readers with to extratt the foul's immortality from fuch an opinion, we muft refer them to the many refources of ingenuity, fophiflry, and iogic.
in the moving of the heart ; fone imagined th.ent it was the breath, and that upon the diffolution of the body it unturally vanilhed into foft air. Thee Sadducees denied the exitence of either angel or fpirit. Many believed the dotrine of gholts, and were accultomed to invoke them at the grave. It is hence that we hear the prophets complaining that they were fecking from the living God unto dead men. Some imatgined that there was a pre-exittence of feuts; and, in the cafe of a blind man, atked our Sasiour, whether the man or his parents had finned that he was born blind? Others inclined to at revolution of foul and body, and thought that our Saviour was either Elias or one of the old prophets retmened; and :t great many new-modelled their opinion of the foul's immertality according to cert:in paliages in Scripture. The infured mother of S:amuel had taid, "The Lord killeth and maketh alive : he bringeth down to the grave, and bringeth up." Iraiah tadexclamed, "Thy dead thall live; together with my dead body fhall they arifc: Awake, and fing, ye that dwell in the duft ; for thy dew is as the dew of herbs, and the earth fhall caft out the dead." Daniel had declared, that many of them that fleep in the duft of the earth thall awake to everlafting life, and tome to thame and everlafting contempt. In the vifion of the valley of dry bones, Ezekicl had feen that "at the word of the Lord" the bones came together, bone to his bone, the finews and the felh came upon them, and the finin covered them above, and the breath came into the bodies, and they lived and flood upon their feet. And a paffage of Job led them to fuppofe, that at fome diItant and luture period a particular time, which was catled the laft or the latter day, was appointed by heaven for the general refurrection of all thofe who are flceping in their graves. "I know (fays Job) my Redeemer liveth, and that he fhall ftand at the latter day upon the earth; and though after my fkin worms deftroy this body, yet in my flelh fhall I fee God."

Whether thefe palfages were fairly interpreted agreeably to their true and original meaning, it is not here our bufinefs to inquire. It is fufficient for us to obferve, that from them many of the Jews infened the reality of a general refurrection ( x ). In this perfuafion, Martha, fpeaking of her brother Lazarus, fays to our Lord, "I know that he thall rife again in the refurrection at the laft day." This refurrcetion appears
(1) The Asxn of the Stoics appears to be the fame with the $I, i$ of the Chinefe.
(c) Y'et without regrading the inconlifency, many of the Stoics believed, that the foul continuted feparate Long after dea'h; thoush all in general leemed to deny a future fate of rewards and punifhments.
(n) In his Pigit a! Lioforgony, 1"ato differed but little from the Stoic ; but he had another fort of cofmogony, ia which all thir esapperer to have fiprung from, and to be almof wholly compofed of, metaphyfical entities, as ideas of forms, numbers, and nathematical figures. Thefe kinds of notions were common both to hinu and Pythatgons: and were originally borrowal from Egypt, where calculation and geometry were half deificd. Sce Peatonism.
(1) The immor:al Harvey has collected thefe different opinions of the Stagyrite in Exercit. 52. De Gencratione Animalion.
(k) At prefent fome are for allowing only thofe of their own nation to thare in the bencfits of this refurrection; and fons are not even for allowing them, except they be men of piety and virtue. To render this refirrection prob,the, the rabbins fay, with fome of the Mohometans, that there is a certain bone in the body waich refifts putrefaction, and ferves as a feed for the next body*. What that bone is, is of no great moment, © Sce Phaas any bone, we believe, in the fecleton wiil anfwer the purpofe equally well. With refpect to the manner of rifee this refurcction, the laaned Hody has queted feveral opinions of the Jcws, and, among others, that of the Chal-

## R E S <br> [ 131] <br> RES

Refursec- to have been a general opinien among the Tharifecs; tion. $\rightarrow$ for althongh it was a notion of the fea of the Saddu. cees that there was no refursection, neither angel nor fpirit, yet the Phatifees, we are told, confeffed lonth. And this affertion is plainly cenfirmed by St Patul himfelf when his countrymen accufed him before Felix, "I confefs unto thee (fays this eminent apoftle), that after the way which they call herefy fo worthip I the God of my fathers, believing all things which are written in the law and in the prophets, and having hope toward God, which they themfelves alfo allow, that there fhall be a refurrection of the dead, both of the juli and un-

This refurrection of the dead to judgment, though not perhaps in the fame fenfe in which the old Phatifees conceived it, is now generally and almof univerfally ( $L$ ) maintained by Chriftians ( $m$ ). Yet the Chriftians differ confiderably with refpest to the nature of the human foul. Some imagine, that this fpirit is naturally mortal, and that it is propagated along with the body from the loins of the parent. In fupport of this opinion, it has been obferved that a great number of infects and plants transfer their lives to their pollerity, and die foonafter the act of propagation; that after this act the vital principle is in the moft vigorous of plants and animals always found to be much exhaufted; and that Tertullian a father of the church, in attempting fome experiments of the kind, became fubject to a momentary blindnefs, and felt a portion of his fuul going out of him ( N ).

There imagine that immortality was only conditionally promifed to man ; that Adam forfeited this immortality by his difobedience ; and that Chrilt has reftored us to the hopes of it again by his fufferings and death: for as in Adam we have all died, fo in Chrift, they fay, we fhall all be made alive ; and that now the fting is taken from death, and the victory over our fouls from the grave.

Others have conceived the human foul as naturally immortal, and as fetting death and the grave at defiance. Adam, they fay, died only in a figure; and only from the confequences of this figure, which means
fin, has one Lord faved us. In thís fenfe Adam died on the very day in which he had finnal; or lee died literally in 1000 years, which with the Lord are at one day. To thefe arguments their opponents reply, What then is the vitory over death and the grave? Yru mutt Aill have recourfe to a new fignre, and betake yourfelves to the fecond death; though, after all, where i, your grave ? 'To this it is mfwered, that the foul of it!elf is naturally immortal, and that it depends not either for is exiflence or the exercife of its faculties upon tlic body; that the properties of matter, as figure, magritude, and mo:ion, can produce nothing that is like to petception, memory, and coufcionsnefs. This is true, rejoin their opponents; but befides thefe few properties of matter, which are only the objects of that philofoply whith has lately and properly been termed mechanica!, the chemical philofophy has difoovered other properties of matter ; has found that matter is of various kinds; that it very often does not ast mechanically ; that it acquires many new properties by combination; and that no man, till farther experiment and obfervation, fhould venture to aflert how far the foul is or is not dependent on its prefent organifed fyttem. The others, proceeding on their hypothefis, maintain that the foul, as being immaterial, is not divinible; and though the body of a frog may live without the head for a whole day; though the cody of a tortoife may live without the head for : whole month ; th ugh a human limb may for fome minutes after amputation continue to perform a vital motion, independent of a brain, a fomach, or a heart; and though the parts of a plant, a polype, or a worm, may furvive their feparation and become living wholes*, "See Folvyet the foul, they obferve, is not to be compared with pusand Rethe vital principles of plants and animals, nor ought to production. be divided on reafons fo flender as thofe of analogy. Even granting, they fay, that the foul were not naturally immortal of itfelf; jet the jutice of God, which is not remarkable for its equal diftribution of rewards and punifhments in the prefent world, is bound to make fome amends in the nest. And to this again their opponents anfwer, as to the equal diftribution of juftice in a future world, of that we are affured on much betR 2

## RES [ 13: ] RES

R furrece ter gronals than any of your's: our Lerd has declare (i) ${ }^{\prime}$ ". it in expeefs terns: an! whether the foul be ammert.al
or nort, we can calily believe what he faid is true, at we b:unw ! him whom we have truited.
'there, with Phato, fuppote, that the foul is here as in pritan ; though how or at what time it thould firt have cone fato this dunseon they have not determinot. They have only agreed, that upon its enlargement all its fucultizsare to receive an increate ol power; and "haing already equipped it fo exquilitely with confcinuliefs, wetivity, and perception in and of ifelf, and pu: it into fo complete a capncity for happinels and mitery in a fepa1:ite llate," thecir liypothetis docs not tequire them to a Imit the leat occalion for a refurreation; whieh aecordingly is laid to have been an article of Baxter's areed ( 0 ).

A thisd opinion, which extends likcwife to every fpecies of phemt and animal, is, that all fouls were ereated at ence with budies of ether; that thefe hodies, occupying oilly" a very fmall fpace, were packed up in their firit prozenitors, and there left to be afterwards evolved and clothed with matter of a groflur kind by aat of generation and confequent nutrition. For the proof of this theory we are reterred to the frmall animals feen through the microfenpe, and likewite to thofe which are fupoofed to etcape even mico ofeopic obfervation; but, above atl, to the eggs of infents, which, though farcely perceptibic, yet contain in embry, a future caterpillar and all its conts, and within thele a future butterfy with its legs and wings. Thefe philofophers can perhaps account for the gencral taint of original fin in fome other way than has hitherto been done. Wre have only to add, that on their feheme the refurreation is not a matter thit feems to be indificrent.

The next thing that falls to be confidered is the place of the dead. From a natural enongh affociation of ideas, an opinion had very early prevailed, that the fpirit continued near to the body ; and the offerines therefore intended for the dead were by moft nations prefentel at the grave; and that on which the departed pipitit is fuppofed to reft is always placed aear the grave in Clina.
From the dreams of the night and the natural tendency of the faney to work and to fummon up fipedtes when the world atound us is involved in darknef, it has alfo been i:nagined, that thefe fpirits delight in the night and than'w ofle th ( P ), or have been prohibited ,rom eajoying the exhilarating beams of day. And hence we are inld,

That in the difmal retrions of the dead
'Ih' insernal king cnee rais'd his horrial head;
Leap'd tr m hio theone, leit Neptune's arm fhould lay
Hin dink dominions ofen to the day,
And pour in lightit.
The nations, therefore, whe rave fancied a general receptucle for the dead, have thas been induced to
place it in the wert (C), where the night begins and Refuspecu the day ends. That part of the world which, in the sion. divifion of his father's dominions, fell to Pluto the infernal god, and where, accorling to Lachantius, Satan in the holds the empire of darknefs, the Friendly Inlanders wefl. have placed to the weflwa:d of a certain illand which they c.ll] Ticje; fome tribes of Ancrican Indians, m a country beyond the wefern mountains; and Homer, fomewhere to the weftwird of Greece at the boundaries of the ocean,
Where in a lonely land and sloomy cells
The dufky nation of Cimmeria dwells;
The fon neer vicws th' uncomfortable feats
When radiant he advances nor retreats.
Uuhappy race! whom endlefs night invades,
Clouds the dull air, and wraps them round in fhades.
A nother opinion entertained by the Grecks and fome Under:te other nations was, that the place of departed fipirits is earch. under the earth. This rpinion is frequently mentioned in Homer, in Virgil, and alluded to by the Jewifh prophets. As for the prophets, we know the circumftance from which they borrowed it: it was borrowed from thofe fubterranenus vaults where their cliefs were buried, and which lave becn delcribed by modern travellers. In the fides of thefe caverns there is ranged a great number of cells; and in thefe cells the mighty lay ia a fort of fate, with their weapons of war and their fiwords at their liead. To thefe kinds of Egyptian cemeteries Ezekiel alludes, when he fays, "that they fhall not lie with the mighty that are fallen of the uncircumcifed, who are gone down to hell with their weapons of war, and they have laid their fwords under their head." And Ifaiah, when thus fpeaking of the prince of Babylon, "Thou thalt be brought down to hell, to the files of the fit. Hell from beneath is moved for thee, to meet thee at thy coming; it Airreth up the dead for thee, cven all the chief ones of the earth; it hath raifed up from their thones all the kings of the nations. All the kings of the nations, even all of them, lie in glory, every one in his own houfe."

Many of the ancient fathers of the church afferted In hidden only, that the dead are now in alditus reccfacalis, or in recepticertain hidden and concealed places.

Orphous, Origen, and fome rthers of the fathers, with the ancient Caledon:an bard Offian, and the learned Dodwell among the modens, imagined that the foul, when it leit the body, went into the air, and refided fomewhere between the fufface of the earth and the moon.

Thote who believed in a tranfmigration canfed the in nev bofoul at death only to enter a new bociy, and kept the dies. departed alway, with the living. This creed has been found in India, in Efypt, in Mexico, and in all thofe combtrics where picturc-witing has been mach ufed. In this feecies of writing, the fame pifture is on fancied analogy transfered by metaphor to fignify cither

[^2]
## RES [ 133 ] liE S

Refurrec- ther a god or a man, a brute or a plant; and in thofe $\underbrace{\text { tion. }}$
$\xrightarrow{\sim}$ countries where it was practifed, men liad ufually their names from anim:tis, and were reprefented by their fi. gure in writing ( n ). From this laft ftage of the procefs, a tranfmigration was eafily fuppofed : and hence we hear of the gods of Egjpt wandering about like fo many vagrants in brute fhapes, and of princes being tranflated into ftars, becanfe a ftar was their emblem in hieroglyphic, or flood for their name in figurative language. And, in like mamer, we fee, from the fpecimen of this character which is ftill preferved on celeftial globes, how the heavens at frit carie to be filled with bears, forpions, and dragons, and with a variety of other animals.

29
State of the
deallac. cording to fome rude nations.

The opinions concerning the fate of the dead are fill more numerous than thofe concerning the place where they refide. Rude nations have gencrally thought that the future fate is fimilar to the prefent ; that plants, animals, and inanimate things there, have their fhades; and that thefe contribute as much to the pleafures and conveniences of the dead as their realities do to the living; that hufbands have their wives ( $s$ ), lovers their miltrelles, warriors their battles, huntfmen their fport; and that all their paffions, amufements, and bulinefs, are the fame as formerly. For this reafon, that the dead may not appear unprovided in the neat world, like the ancient Gauls, fome tribes of India, America, and Africa, bury with them in the fame grave their wives, their arms, their favourite animals, and their neceffiry utenfils.

The ancient Egyptians, who believed in tranfmigration, fuppofed that the feul was after death obliged to animate every fpecies of bird and quadruped, of reptile and infect, and was not to return to a human form till after a period of 3500 years. Others have confined their tranfmigrations to particular animals, as the foul of man to the human form, and the foul of the brute to the bodies of the fpecies to which it belonged. Some have changed the brute into man, and man into the brute, that man might fuffer injuries fimilar to what he had innisted, and the brute retaliate what he had fuffered. Others have confined the human foul in plants and in ftones; and Bell of Antermony mentions an Indiar who fuppofed that his anceftors might be in fifhes.

The notions of Homer were probably thofe of many of his time. But thefe notions were difmal indeed. When his hero Ulyffes vifited the fhades, many of the ghofts feemed to retain the mangled and ghaitly appearance
which they had at death; and, what is worfe, feemed Refurrecto be all flarving with hunger, innumerab:e multitudes, with loud fhrieks, flocking to the fteams of his flain victim as to a moft fumptuous and delicious banquet.
For fearcely had the purple torrent flow'd, And ail the caverns fmok'd with flreaming blood, When, lo! appear'd along the dulky coatts Thin airy fhoals of vifionary gholts; Fiir penlive youths, and foft enamour'd maids, And withet'd elders, pale and wrinkl'd lhades.
Ghaftly with wounds, the forms of warriors flain,
Stalk'd with majeltic port, a martial train.
Thefe, and a thoufand more, fwarm'd o'er the ground, And all the dire affembly thriek'd around.
Ulyffes faw, as ghofl by gholt arofe,
All wailing with innutterable woes.
Alone, apart, in difcontented mood,
A gloomy fhade, the fullen Ajax ftood;
For ever fad, with proud difdain he pin'd,
And the loft arms for ever tlung his mind.
Upon Ulifes faying to Acbilles,
Alive, we lail'd thee with our guardian gods;
And, dead, thou rul'ft a king in thefe abodes;
The foade reply'd:
'l'alk not of ruling in this dol'rous gloom,
Nor think vain words (he cry'd) can eafe my doom;
Rather I choofe laborioufly to bear
A weight of woes, and breathe the vital air,
A slaveto some poor hindthat toils for bread, Than live a scepter'd monarch of the dead.

In this gloomy region no one is rewarded for his virtue, nor is punifhed for his crimes, unlefs committed, like thofe of Sifyphus, Tantalus, and Ixion, againit the gods. All indeed are claffed into groups, from a certain analogy of age, fex, fate, and difpofition; but all appear to be equally unhappy, having their whole heart and affections concentrated in a world to whicla they are fated never to return.
The Ely fium of Homer is allotted only for the relations and defcendants of the gods; and Menalaus goes to this country of perpetual fpring ( $I$ ), not as a perfon of fuperior merit, but becaule he had married the daughter of Jove.

Even long after a future fate had become the fcene Beconics a of rewards and punifhments, thele for the molt part place of rewere diffributed, not according to moral, but phylical wards and diltinctions. With the Greeks and Romans, the foul puuif. was condemned to many calamities for a number of monts.
(R) A military gentiennan who refided at Penobfcot during the late American war, affured us that the Indians, when defired to fubfribe a written argreement, drew always the picture of the object or animal whofe name they bore. But for fuller information on this fubject, fee Clavigero's Hitt. of Mexico.
(s) The queftion which the Sadducces put to our Saviour about the wife of the feven brothers, is a proof that the Pharifees th ought there was marriage and giving in marriage in the future ftate, and that it was fomewhat fimilar to the prefent.
( x ) Homer fends the ghoft of Hercules to the fhades, while Hercules himfelf is quaffing neetar with Hebe in the fkies. One foul of the hero is thercfore repining with the ghofts of mortals in the regions below, while the other is enjoying all the happinefs of the gods above. (See Odyssey, B. II. near the end). Philofophers fince hive improved on this hint of the poet; and men have now got rational, animal, and regetaile fouls, to which fometimes a fourth one is added, as properly belonging to matter in general. Homer infinuates, that Menelaus was to be tranhlated to Elyfium without talting death. This Elyfium is the habiation of men, and not of gholts, and is defcribed as being limilar to the feat of the gods. Compare Odyf. iv. 1. 563. and Odjf. vi. 1, 43. in the Greek.

Andatterwards accurding to Hooral ditinclions. ca with intamy, wh.le a siclent death, particularly in battle, yave al titl: to dit in the ball, of Odin, abd to guluft beer fiom the kulls of eremies. Among the Thuca'an, it wis n:ly the great 1 latu were promited
 rabks were 'r n-iormed in* wealels, inco paultry bectles, amel tid mem animals. Among the Mexicms, thole wion were drowred, who died af it dropfy, the mets, ก- wounds, or fich like dife.fes, went along with the childres that liad theen ficrifical to the god of w.tter, and ia a cool and dolighefol place were allowed to indu'ge in $A^{1}$ licious repalls and valuties of plentires: thofe who diad of other difedes, were fent to the north or centre of the earth, and wete moder tle dominion of the guds of dartinefs. " 'the foldiers who died in louttic, of in captivity among their enemies, :1nd the wrmen who ded in libour, went to the howte of the fin, who was conlidered ats the paince of glory. In his manlions they led a life of endlet's delight. Exery day the foldiers, on the firf appearance of his riys, hailed his birth with rejoicings and with dancings, and the mufic of inftuments ard voices. At his meridian they met with the women, and in like feftivity accompanied lim to his fecting. After four years of this glorious life, they went to animate clonds, and birds of beautiful feathers and of fivect fong; but always at liberty to rife again, if they pleafed, to hearen, or defeend to the earth, to warble their fongs, and to fuck flowers *."

Thefe fentiments of a future fate, conceived in a farage and a rude period, could not long prevail among an enlightened and civilized people. When the times of rapine and violence therefore began to ceafe ; when focieties regulated by certain laws began to be eftablifhed; when matial prowefs was lef's requifite, and the qualities of the lieart lad begun to give an importance to the character, the future fate was alfo modelled on a different plan. In the Aneid of Virgil, an author of a highly cultivated mind, and of polithed manners, it becomes a place of the mof impartial and unerring juftice; every one now receives a fentence fuited to the ittions of his pafl life, and a god is made to prefide in jufgment;

Who hears and judges each committed crime, Inquires into the manner, place, and time.
The confcious wretch muft all his afts reveal,
Loth to confefs, unable to conceal,
From the firft moment of his vital breath,
'I'o the lat hour of unrepenting death.
The fpirits of the dead no longer mingle together as in the lefs enlightened period of Homer; the vicious are difmiffed to a place of torments, the virtuous fent to tegions of blifs: indifferent charaders are con-

- Or para-

The fouls of babes, of unhappy lovers, and fome $3^{8}$ others, feem to be placed in a paradife of fools re- His parafiding in a quarter diflinet from Fl.fion Tartarus and dife of arus and fools. Purgatory:

It is curious to obferve, how much thefe ideas of a future tate differ from the vague and fimple conjectures of rude nations; and yet from their fimple and rude conjectures, we can eafily trace the fuccefive changes in the writings of Homer, Plato, and Virgil ; and may eafily thow, that thofe laws which different nations have prefcibed for their dead, have always borne the frongeft analogy to their ftate of improvement, their fyfen of opinions, and their moral attainments. Sonie nations, as thofe of India, have fancied it number of heavens and hells, correfponding to fome of their principal Thades in virtue and vice; and have filled each of thefc places refpectively with all the focnes of happinefs and mifery, which friendllip and hatred, admiration, contempt, or rancour, could fuggcll. But having already obferved the progrels of the human mind in forming the grand and leading ideas of a futurc fate, we mean not to defeend to the modifications which mas lave occurred io particular nations, fe̊s, or individuals.
'The belief" of Clriftians refpecting futurity demands our attention, as bcing founded on a different principle, our attention, as being founded on a different principle, of the tlead
namely, on exprefs revelation from heaven. From as revealed many exprefs declarations in Scripture, all Chritians in Seripfeem to be agreed, that there is a heaven appointed for ture.

Refurrec. tion.
the good and a hell for the wicked. In this heaven the laints dwell in the prefence of God and the uninterrupted fplendors of day. Thofe who have been wife thine as the firmamert, and thofe who have converted many to righteoufnefs as the flars. Thair bodies are glorious, immortal, incorruptible, not fubject to difeafe, to pdin, or to death. Their minds are ftrangers to forrow, to crying, to difappointment ; all their defires are pretently fatistied; while they are calling, they are anfwered; while they are fpeaking, they ate heard. Their mental faculties are allo enlarged; they no more fee things obfcurely, and as thruugh a cloud, but continually beholding new wonders and besuties in creation, are conttantly exclaiming," Holy, holy, holy! is the Lord of Holts, worthy is he to receive glory, and honour, and thankfgiving; and to him be alcribed wifdom, and power, and night; fcr great and marvellous are his works, and thermole unive fe is filled with his glory."

Their notions of hell differ confiderably. Some underltanding the Scriptures literally, have plunged the wicked into an abyfs without any bottom; have made this gulph darker than night; have filled it with rancorous and onalignant firits, that are worfe than furies; and have deicribed it as full of fulphur, burning for ever. This frightful gulph has by forne been placed in the bowels, of the earth; by forne in the fun; by fome in the moon; and by fome in a comet: hut as the Scriptures have determined nothing on the fubject, all fuch conjectures are idle and groundlefs.

Others imagine, that the fire and fulphur are here to be taken in a figurative fenfe. Thefe fuppofe the torments of hell to be troubles of mind and remorfes of confcience; and fupport their opinion by obferving, that matter cannot ast upon fpirit; forgetting, perhaps, that at the refurrection the fpirit is to be clothed with a body, and, at any rate, that it is not for man vainly to prefcribe bounds to Omnipotesce.
or the mid. What feems to have tortured the genius of divines much die flate, and different opinionsabout it. more than heaven or hell, is a middle ftate. On this fubject there being little revealed in Scripture, many have thought in incumbeat upon them to fupply the defeet ; which they feem to have done in different ways. From the Scriptures fpeaking frequently of the dead as fleeping in their graves, thofe who imagine that the powers of the mind are dependent on the body, fuppofe that they fleep till the refurrection, when they are to be awakened by the trump of God, reunited to their bodies, have their faculties reftured, and their fentence awarded.

This opinion they fupport by what St Peter fays in the Aĉs, that Divid is not afcended into heaven; and that this patriarch could not poffibly be fpeaking of limfelf when he faid, "Thou witt nor leave my fonl in hell, i. c. the place of the dead." They oblerve, too, that the vidtory of Chrift over death and the grave feems to imply, that our fouls are fubject to their power; that accordingly the Scripture freaks frequently of the foul's drawing near to, of its being redcemed from, and of its defcending into, the grave; that the Pialmit, however, declares plainly, that when the breath of man goeth forth, he returneth to his earth, and that very day his thoughts perilh. And fhould any one choofe to confult Ecclefiates, he will find, that the living know that they thall die, but that the dead know not any thing : that their love, and their hatred, and their envy, are ferifhed; and wat there is no work, nor device ${ }_{2}$ nor

## 1351 K E S

widom, nor knowledge, in the grave, whither they are gone.

Refurtce
Thofe who believe that the foul is not for the exercife of its faculties dependent on the body, are upon its lep leration dand way at eath obled to dilpofe of it fome other ta, utheri, a way. In eft.blithing their theory, they ufua'ly begin flate of with attempting to prove, from Scripture or tradi- confious tion, both its active and feparate exiftence; but wi:h proofs from t:adition we intend not to meddle. Their arguments from Scripture beng of more value, deferve cur ferious confideration; and are nearly as follow.

Abraham, they fay, Ifaac, and Jacob, are fill living, becaufe Jehowah is their God, and he, it is allowed, is nut the God of the dend, but of the living. But their opponents reply, That this is the argument which our Saviour brought from the writings of Mofes to prove a future refurrection of the dead; and that any perfon who looks into the context, will fee it was not meant of a middle flate. From the dead living unto Gost, our Saviour infers nothing more than that they flatll live at the refurrection; and that thefe genthemen would do well in future to make a diltinctionbetween fimply living and living unto God: For thougla Abraham, Ifuac, and Jacob, be living unto God, our Saviour has alfured us that Abraham is dead, and the prophets dead.

A fecond argument is that glimpfe which St Paul had of paradife about 14 years before he had written his Second Epiltle to the Corinthians. To this argument their opponents reply, That as St Paul could not tell whether, on that occation, he was out of the body or in the body, it is more than probable that the wholewas a vifion; and, at any rate, it is no proof of a feparate exiftence.

A third argument is, St Paul's wifhing to be abfent from the body, and prefent with the Lord. But, fay their opponents, St Paul defired not to be unclothed, but to be clothed upon: and as fome of thofe who maintain a feparate exiftence, bring Scripture to prove that the bod $\bar{y} \|$ contiaues united to Chrift till the refurrection; in that cafe, S: Paul, if he wifhed to be prefent with the Lord, thould have rather remained with his body than left it.

A fuurth argument is, the appearance of Mofes and Eliss upon the mount of transfiguration. To which their opponents reply, that thefe faints appeared in their bodies; that Elias was never divefted of his body; and that the account which we have of the burial of Mofes, has led fome of the ableft critics and foundeft divines to conclude, that he was likewife tranfated to heaven without tatting death. At any rate, fay they, he might have been raifed from the dead for the very purpole of being prefent at the trinsinguration, as the bodies of other faiats certainly werc, to bear teltimony to our Lord's refurrection and victory over the grave.

A fith argument is, what on Savivur faid to the thief, "Verily I fay unto thee, to-day thou firalt be with me in paradife." The objection ufually made here is, that the expreffion is evidenty ambiguons, and that the fenfe depends entirely on the pumetuation: for if the point be placed after $t o-d a y$, the meaning will be "Verily, even now, 1 tell thee, thou thalt be with me in paradife." But the impoit of paradife in this place, fay the opponents, is likewife doubtful. We learn from.

Other:
fuppure th. the 1 sulafter death entersa feate of rewards and punif:rectits in a certzin ciegree.
difpube, the ingenious Burnet, in his Theory of the I. erth, enjeaveurs to prove, upon the authority of the anhiene lahers, that paradifelies between the carth and the moun; and tic learicd Dosiwell, on the lime ateshowity, han made it the c moon recep:acle oi fouls til! the reinaction; but has not teld us whether or nut Hey are to be accountable for the attions of this feparate exikence at the latter d.ty, or are only to be fulpalacoording to the deeds that were done in their Ladies.

This mation of a common recepticl: has difple afed m.ny. Tire llate of purgation, offarely hinted in the dodrines of Pythagitas, and openly avowed by Plato and Virgit, his been adopted by the Ronith divines, who fuppurt their opinion on certain obfcure pallazes of foriptu:e, which arc always of a yielding and a wasen nature, may cafily be twilted to any hypothefis, and like gencrallovers efpoufe tather from interell than merit.

It has dippleafed others, becaufe they are anxious that the righteous thould have a fore-tafte of thein joys, and the wicked of their torments, immediately after death, which ilicy infer to be certainly the cafe from the parable of the rich man and Lazarus (u). But to this it is objefted, that the rich man is fuppofed to be in hell, the place of torments, and that this punifhment ought not to tale place on their own hypothefts till after the fertence at the refurrection.

Another argument ufed for the intermediate fate is the vifion of St John in the Apocalyple. In this vifion the Evangelif faw under the altar the fouls of thoic that were flain for the word of God and for the tefimo$n y$ which they held. Their opponents doubt whether there vibible fouls, were immatcrial, as St John heard them cry with a loud voicc, and faw white robes given unto every one of them. If they had bodies, that circumftance might chance to prove a refurcection immediately after death, and fofuperiede the general iefurrection at the laft diy.

While fucla conclafions as are here drawn from the parable and vifion, fay the oppofers of an intermediate confcious exiftence, imply that the dead are already rafed, and are now receiving the refpective rewards of their virtues and their crimes; thofe who maintain an intermediate feparate exilence, who fpeak of the body as a prifon, and of the foul as receiving an increafe of power when freed from the body, are cettainly not more than conliftent with thembives, when they think that this foul would derive an advautage from its after union with either a new fyftem of matter or the nld onc, how. ever much altesed. Baxter, they fay, who diw the in-
ne.ts,
 Rec:orn to valit out tilctrial cline? Or that !! fe feis'rous mind, rleas'd at desth, should covet lazy lin! sud mortal Lucath?
In so one inftates, they continan, have Chriatians perhans rov:e anparent'y than in this argument wrefed the Sicriptures to ehers own hurt: by thus ralhly at-t-my:tiag to acenam wate the facred do trines of relicion to : precorceived philifophical hypotheris, they have laid thermeives rpen in the ridicule of deills, and have been obliged, for the fake of contittency, either to deny or to fpeak tlightingly of the reliurection; which is cettainly the fured foundation of their hop?, feeing St Paullathatlured us, that if there be no relurrectiona of the dead, then they which are tallen alleep in Chrift are perithed, and laofe who turvive may eat and dink, and at as they pleale, for to-norrow they die; and die, ton, never to live again.

Though this reproof may be rather fevere, we are forry to obferve that there feems to have be been fometimes too mucla reafon for it. A certain divine $\dagger$, whofe picty was eminent, and whofe memory we refped, having written "An Elfay toward the proof of a feparate Sate of Souls between Death and the Refurrectien, ald the Commencement of the Rewards of Virtue and vice immediately alter death," lias taken this mo:to, " Becaule fentence againft an eril work is not esecuted fpeedily, therefore the heart of the fons of men is fully fet in them to do evil." "The doctrine, he fays, of the sefurtection of the body and the confequent ftates of heaven and of hell, is a guard and motive of divine force, but it is renounced by the enemics of our holy Chrifianity; and Should we give up the re. compenfes of feparate fouls, while the dcif donies the refurrection of the body, I fear, between both we fhould fadly enfeeble and expore the caute of virtue, and leave it too naked and defencelefs."

This author, who wifhes much that the punifhment of crimes fhould follow immediately after death, is of opinion, that if heaven intended to check vice and impiety in the world, it has acted unwifely, if it really has deferred the punifhment of the wicked to folate a period as the refurrection. "For fuch, he obferves, is the weaknefs and folly of our natures, that men will not be fo much influenced and alarmed by dilfant profpects, nor fo folicitous to prepare for an event which they fuppofe to be fo very litr off, as they would for the lame event if it commences as fuon as ever this mortal life expires. The vicious man will indulge his fenfualities, and lie down to fleep in death with this comfort, I thall take my relt here for 100 or 1000 years, and perhaps in all that fpace my offences may be forgotten; or let the worf come that can come, I thall have a long fucet nap before niy forrows begin : and thits the force of divine tenors is greatly enervated by this delay of pumiflment."

Thus far our atuther, who thinks that his hypothefis, if not truc, is at leaft expedient, and that from mo. tives of expediency it ought to be inculcated as a doctrine
(v) Whitby fhows that this parable was conformable to the notions of the Jews at that time ; and even the Mahometans, who belicve in the refurcoction of the dead, fuppofe likewife a ftate of rewards and punifhments in the grave.

## RES

Refurrec-
tion.
that bed the diftance of future rewards and punithments is not greater on the fuppolition of the flecp of the ful than on the contrary hypothefis. Every man whe has but dipt into the fcience of metal hyfics knows, and no man ever knew better than be who is believed to bave been the author of the work before $u$, that time unferceived paffes awiy as in an inttant; and that if the foul he in a tate void of confcioufnefs between death and the refurrection, the man who has lain in his frave 1000 years will appear to himfelf to have died in one moment and been raifed in the next. We would likewife recommend to thoie who may henceforth be inclined to inculcate any thing as a doctrinc of Scriptore mercly on account of its fuppofed expediency; always to remember that God is above, that they are below, that he is umnifient, that they are of yefterday and know little, that their words therefose fhould be wary and few, and that they fhould always ipeak with refped of whatever concerns the Sovereign of the univerfe, or relates to his government either in the natural or moral world. For wilt thou, lays the Higheft, diamnul my judgment? Wilt thou condema me that thou mayeft be righteous? Shall he that contendeth with the Almighty inftuet him? He that reproveth God let him anfiver it.

If, in flating thefe oppofite opinions, we may feem to have favoured what has been called the fleep of the foul, it is not from any conviction of its truth, for there are particular texts of Scripture which appear to us to militate againft it. We are fatisfied, however, that it is a very harmlefs opinion, neither injurious to the reft of the articles of the Chrilitian fairh nor to virtuous practice ; and that thofe who have poured forth torrents of obloquy upon fuch as may have held it in fimplicity and godly fincerity, have either miftaken the docirine which they condemned, or been poffeffed by a fpirit lefs mild than that of the gofpel ( $x$ ).

Whatever be the fate of the middle ftate, the refurrection flands on a different bafis. It is repeatedly afferted in Scripture; and thofe grounds on which we belicve it are authenticated facts, which the affectation, the ingennity, and the hatred of fceptics, have numberlefs times attempted in vain to difprove. Thefe fatt we are now to confider, referring our readers for the character of the witnelfes, the authenticity of the go-fipel-hifory, and the poffibility of miracics, to the parts of this work where thefe fubjects are treated (See Miracle, Metaphysics, Patt I. Chap. vii, and Religion) ; or, thould more particular information be required, to the writings of Ditton, Sherlock, and WVef.

Our Lord, after proving his divine mifion by the miracles which he wrought, and by the completion of ancient predictions in which he was deferibed, declared Vor. XVI.
that the inatine of a refurection
truth, which ha carae to annonnce. To fowe o? dianc an evert was poffible, he reftured io life tic d mind ut frirus, a ruler of the fynageque, a ronog man of wome, who was carried out on his in er :o be buited, and his frien I Lazeruc, whofe br.dy at the tin.e was thouzht to have become the prey of coriuptionl. Th ught the tw: firte of thefe miracles were wrought in the prefi:ice of a number of witnelfes, yet the lint, owing to paiticular circumfances, produced a much greater noilie among the Jew:. It was periormed on a perfon feemingly ni fume note, in the village of Bethany, not far frim Jerufilem, and in the pretence of a great many perfens who from the metropolis had come to crncule with Mary and Martha. No diubts were entertained of the reality of Lazarus's death. Our Lord was at a diftance when he expired, and his body had already been lying for fome days in the grave. When he came forth ab the snice of our Lord, all were afonificd. Thofe from Jerufalem, on returning home, are impatient to relate what they had feen ; thofe who heard of fo memorable an event cannot conceal it ; the report reaches the ears of the lharifees and chief priells. They are foon made acquainted with every circumitance; and dreading the iffue, they think it necelfary to call a council upon the occafion, and concert the meafures that ought to be purfued in a matter which was likely to be attended with fo many and important confequences. In this council, it feemed to be agreed that our Lord had performed, and was Itill continuing to perform, many miracles: That this laft miracle, as being of an extraordinary kind, would make many converts ; and that if meafures were not fpeedily taken to prevent thefe uncommon difplays of his power, all would believe on him : the jealoufy of the Romans would be excited, the rulers depofed, and the nation of the Jews deprived of its few remaining privileges. Yet, notwithfanding thefe private conceflions made in the council, the members who dreaded to let their fentiments be known to the people, affeet in public to treat our Saviour as an impoftor. But he who already had demonfrated the abfurdity of their opinion, who fuppofed that his miracles were wrought by Beelzebub prince of the devils, is again ready to confute the ridiculons affertion of thofe who pretended to fay that they were a deception. His friend Lazarus was fill living at the diftance of only a feir miles, and many of the Jewrs who had gone to fee him were ready to atteft the truth of the report. If the rulers, apprehending the confequences of the trath, be alraid to know it, and if they are unwilling to go tu Bethany, or to fend for Lazarus and thinfe who wele prefent at his refurreation, our Lord gives them a fair opportunity of deteating his frand, if there was any fith to be found in him. To preferve their power, and remove the jealous firpicion of the Romans, it had beer already determined in council to put him to death; and S our
(x) Perhaps no man has been more culpable in this refpect than the celebrated Warburton, who feems at firt to have himfelf denied an intermediate fate of confcious exiftence. He afterwards imagined that fuch a llate is fuppofed, though not exprefsly aflerted, in Scripture ; and at laft he maintained it with all the zeal and warmth of a profelyte. To prove the fincerity of his converfion, he treated his adverfaries with fcurrilous nicknames, banter, and abufe; a fpecies of reafoning which feldom fucceeds in recommending a bad caufe, and which never coufers credit on one that is good.

 as th wryatu feptical inguirers, if their object was only T A.and atere thuth. At the next feltival of the paifwat, wen the ficheme of Cuity has was put in execution, on. when it was deened expediert by the council that he th ula dis, to the the nation frem the jealony of
 Rowe he was apprehended, was tried as an enemy to her givernment, was at latt condemmed upun falfe eviLeme, and fajemded on a crofs unt they were fully fatisfid of his death. Eiven after his death, the fpear of a $i$ dier was thant into his fole; and the water that Sulted out with the b'ood is a proof to thofe who are acquaned wit) the fruture and economy of living bodics, that he mult have been fome time de.ud.

A fter he was taken down from the cri is, a feal was put on the donr of the fepulchre in which he was laid, as the beft check againd fecret frand ; and a gudat of folders wo:s tationed around it, as the belt fecurity againll open riolence. In fpite, however, of all thefe 1 recautions, ti.c prediation was accomplithed; the angel of God, defeending from heaven wi:h a countenatuce like lightuing, and with taiment white as frow ; the watch nhake, atai become as dead men; the earth guakes; the fiune is rolled form the mouth of the fet Whelre ; the angel lits on it, and our Lord comes jorth.

It was in vain for the Jews to allege that his difcifles came in the night, and fole himasay, while the Tatch were aflecp. One mult imile att thefe pucrile afferti. ns. How came the $d$ ficiples is know that the wa:ch were atlecp; or what excute had the watch for $\therefore$ aping, aral incur riag a punithment which they knew to be caritat in the Roman law? and how came they, in the nanic of wind r, to be b:newht ats an evidence for thofe traniations that happeacd at the time when they w:re afoep?

Whatever cretit may be given by modern infuels to Sit iil maned is ry, it is prit dipure that it han none omone tie Jewith 1:1 wat the time that it was current. No: long , uter cur Shainu's rifarsection, the apofles weer cillud betore we commil, ansl threatened with dath ior teaclan,s in the manc if $f=f u s$. Their buld-
 that the thre $t w$ whi have leea intenty y put in execuwon, had mut Gamathei, a dustor of the haw of high reputition, pat them in nind of other imponars who had perillied in their atteny ts to millead the people; and tonicludud a very fenfible fipech with thate reamarkible w inds: "And now, I fiy muto you, refrain from thefe rien, and let them atone; for it this courfel, or this wo:l, be cifmen, it will come to nought; but if it be
of Ci., ye cannot overthrow it, ieft haply ye be fumand Refurrec. even to fight aga oft Gol." 'll is advies the cruacil foll wod. "hut is it pollible that Gamalicl could have given it, of the comatil paid the leaft regard to it, had the hory of the difciples fealing the hody heen then credied? Surely fome among them would have obferved, that a work or comnfel, founded on impolture and fraud, could not be finpoled to te of Go.l, and they would unquellionably have flain t!.e apofles.

The ftery of fteating the body is indeed nne of the moft fenfulefs fitions that ever was invented in fupport of e bad caufe. Onr Lord was on earth 40 deyys atier he arole. He apfeared frequertly to his difciples. I He ate and drank in their prefence; and when fome of thom doubted, he bade them hantle him and fie that he was nut a fpeefre, thowed the mart of the fpear in his fide, and the prints of the nails in his fert and hands. leefides thus appearing to his difciples, he was feen ty more than 500 bretiren at one time; all of whon, as well as his difciples, muft neceflarily have known him previou; to his fiffering, and could therefore attelt that he was the perfon who was once dead but was then alive. Yet for ftrangers in general, who had not feen lim previous to his death, and could not thereforc identify his perfon after he arofe, onr Lord referved many other proofs that were equally convincing. Before his afienfion, be bade his difciples wait till they received power, by the Holy Ghof defcending upon them: That then they fhould be witneffes with him, both in Jerufalem, and in ail Judea, and in Ěamaria, and unto the uttermoft ends of the earth; in order that the peopic of all thefe nations, obferving the miracles, wrought in his name, might themfelves become ocular witneffes that thofe who preached his refurseation were warranted to do fo by his authori:y ; and that this aththority, on which fo numerous miracles attended, mult be divine.

We interd not here to examine the minute oijections minurcoband cavils that have been advarceit refpecting the truth jeqiots. of this important fact. The kinds, howevcr, we thall and triling mention in general. Some bave donbted of our I.ord's cavils. refurretion, as being an cvent which is not confirmed by general experience, becaufe they imagine that what happens once thould happen .ggain, and evin repeatedly, in arder to be true. Some. taking thair awn to be preferable fehemec, have whected in the way in which it happened, and to the mamer in which it is rasrated.Sume have imagined, that pofibly the gofpel hitory may be falfe; thatt poilibly the difciples were very ignorant, and might be dece v d ; that p Hibly, ton, they were deap politicians, and a fet of impofors; and that polfibly the writings which detected their fulfehoods may have been deftioyed. It in dificult to reafon, and worfe to envence, againt this cridence of pofitilities: but we flatter ourtelves, that to the cadid reader of wili appear fufficiently overturned in our article Mracle ; where it is fhown that meither ciowns nor phtitians could have acted the part that was ased hy the apofles, had not the refurrection $b_{i n}$ an und wbed hiat.

Some ot the objectors to it have alfio mantained, that poifibly there is nothing material withont us, that there is nothing mental within us, and that potibly the whole world is ideas. 'Tlyis mode of arguing we pretend not to explain; it is thought by fome eo proceed entircly from a perverfenefs of nind or difpofition, white in books

Refurree of medicine it is alsays confidered as a fymptom of dif.
tion.
52 eafe, and the patient recommerded to lee ircated in the hofpital, and not in the academy.
Importance By his raibiner others, and particulary by rifing himof the doctriate of a refurrection. Acli, from the dead, nur S:wiour demonilrated that are. furrection from the dead is poffble. Ard on that ant thority, which by his miracles lic proved to be divine, he doclared to his followers, that there is to be a get?ral refurrection both of the jult and of the unjutt, inftucting lis dilciples to propagate this doctrine through all nations; Sc Paul confefing, that if there be no refurrection of the dead, preaching is vam, and our faith is

As to the order of fuccefion in which the dead are to be raifed, the Scriptures are almoft filent. St I'aul fays, that every man is to rife in his own noder, and that ti,e dead in Chrift are to rife firlt : and St Jolin obferred in his vilion, that the fouls of them which were beheaded for the witnefs of Jefus, and for the word of God, and which had not worthipped the bealt, neither his image, neither had received his mark upon their fircheads, or in their hands, lived and reigned with Chrift a thouland years; but the relt of the dead lived not again until the thoutand years ( y ) were finifhed.

A queltion that has much oftener agitated the minds of men is, with what furt of bodies are the dead to be raifed? St Patul has anfwered, with incorruptible and immortal bodies (z). And to filence the difputatious caviller of his day, he illuftrated his doctrine by the growth of grain. "Thou fool (faid he), that which thou foweft, thou foweft not that body that fhall be, but bare grain, it may chance of whent or of fome otler grain." To us it appears very furprifing, that any one who reads this faffage with the nightelt attention, fhould perplex himfelf, or difturb the church with idle attempts to prove the identity of the bodies with which we thall die and rife again at the lait day. The apoftle exprefsly affirms, that "Hefh and blood cannot inherit the kingdom of God; that we thall all be changed, in a moment, in the twinkling of an ere, at the lat trump ; that there are celeftial bodies and boclies terreftrial ; and that the glory of the celeftial is one, and the glory of the terreltrial another."

That this implies a total change of qualities, will admit of no difpute; but ftill it has been conlidered as an article of the Chrillian faith, that we are to rife with the fame bodies in refpect of fubtance. What is meant by the identity of fubltance, with qualities wholly different, it is not very eafy to conceive. Perhaps the meaning misy be, that our incorruptible bodies th.ll conilt of the lame material particles with our mortal bodies, though thele particles will be differently arranged to produce the different qualities. But as the paticles of our jrefent bodies are conftantly changing, and as different particles compofe the body at different times, a queftion has been put, With what fet of particles thill we rile? Here a fingular variety of opinions have been held. Some * contend, that vie thall rife with the original

Aamida of onr boaies derived from cur parcits ; f me are bor ring with that fot of particles r hach they : ind at livtl: fome with the fet which thes are to ba:e at death ; and finde with the particies which remain after maceration in watert; though, God lnow:s, that if inis materation be continued lung, the fe may atrie with icw: or no parcicles at all. Anoiher query has given rouch alurm. What if any of theis puticles dhould ente: a vezciable, compole its frat, ard be caten by a nata, woman, or a child? Will not a difputc, limilar to thai apprehondedty the Sadducees about the wife of the feven brothers, necchisily follow, whofe particies are they to be at the refurrection? Againft this contufion they trult that the goodnefs and wifdom of heaven will take all the proper and neceflary meafures; and they even venture to point out a way in which that nay to done. A foot deep of earth, they obferve, in two or three of the counties of Engiand, fuppofing each perfon to weigh on an average about feven fones and a few pounds, would amply fupply with material bodies $600,000,000$ of fouls for no lel's a fpace than 20,000 ycarsf; and therefore there feems to be no necefity for the vamping up of their old materials to lodge and ac. commodate new fouls.

But, unluclily here, the quellion is not absut the polibility of keeping the particles of diferent bodies feparate and difinct. The queltion is rather, What have the Scriptures determined on the fubject? Now the Scriptures fay, that the firit returns unto God who gave it. And hoould it be alked, in what place does he referve it till the refurrection? the Scriptures reply, in the place of the dead; becaule the foul defcends into the pit, is redeemed from the grave; and the Ating of death, the laft enemy that is to be deftroyed, thall be taken away when the trumpet of God thall found : at which time the dead that fleep in their graves fhall awake, fhall hear the voice, and thall come forth. There is not here fo much as a word concerning the body; and therefore it was afsed with what bodies are the dead to be raifed? To wilhich it was anfwered, the vile body is to be changed. The body which $i$ s, is not the body which fhall be ; for the corruptible mult put on incorruption, and that which is mortal, put on immortality.

This curious difcovery of the fentiments of Scripture we owe to a lay-man, the celebrated Locke; who, in one of his controverfies with the bifhop of Worcciter, came to underltand what he knew not before, namely, that nowhere have the Scriptures fpoken of the refurrection of the fame body in the fenfe in which it is ufually conceived. The refurrection of the fame perfon is indeed promifed ; and how that promife may be fuiflled, notwi hot.inding the contant change cittie particles of the body, has been fhown in another place. See Metaphysics, Part III. Chap. iii.

The advocates, therefore, for the refurrection of the mortal body, have again been obliged to betake themfelves to the flifts of reafoning. It is proper, fay they, $S:$ that

R:furreeturn. $\Rightarrow$ Hos'v. ~
${ }^{6}$ sce illo. dy' Rforurrection of the fame body aftert-

Finsling this hypo beti, fupported by neither Scripture rur fesfon, they next appenl to the ancient fathers. And they, it is contelicd, are for the refurreation of the bery fame fleth. But this totion is diectiy contiary to the Scrip:ures, which have faid, that thelh and blood are not to inherit the kingdom of Gock.

But whatever be the bodies with which the dead are to be raifed at the general refurceation, all mankind mult appear in judgnint, and receive fentence according to the deedo done in the body, without regard, fo $f_{\text {ar }}$ as we know, to their aftions and conduct in the middle ftate. After this fantence, the righteousare to enter into celeftial and eternal joys, and the wicked to fuffer the punifhments of hell. Thace punifhments fome have luppofed to be everlating; others think, that after fome temporary puniftment, the fouls of the wicted are to be annihilated; and others imagine, that $a^{\text {ther }}$ doing purgatorial penance for a while in hell, they are to be again received into favour; inclining to exflain the denunciations of the Almighty as a child would do the thicatenings of his mother, or a lover the affected chidings of his mittrefs (A).

RESLSCITATION, the fame with refurreftion and revivification. Sice the preceding article and $\mathrm{RE}_{\mathrm{E}}$. aximitiov:
The term refufitution, however, is more particularly ufed by chemills for the reproducing a mixed body fom its alhes; an art to which many have pretended, as to reproduce plants, \&ec. from their athes.

RET'AII., in commorce, is the felling of goods in Imall parcels, in oppofition to wholefale. See Consizce.

RETAINER, a fervant who does not continually dwell in the huyle of his mafter, but only attends upin fpecial occations.

RETAIANG ref, the firl fee given to a ferjeant or councilor at law, in order to make him furc, and prevent ! is pleading on the contrary fide.

RETALIATION, among cisilans, the att of returnirg like for like.

RLTARIATION, in phyfics, the at of dimi. rifhing the velucity of a moving body. Sec Guxnery, iniechanics, $\mathrm{P}^{2}$ neumatics, and Projectiles.
 tatwork of velbls in the brain, furroundug the piruitary gland.
RETENTION is detined by Mr Locke to be, a faculy of the mind, wherely it keeps or retains thofe limple ideas it has once reccired, by fentation or reHection. Sec Metaphysics, Part I. Chap. ii.

Retenflon is allo ufed, in medicine, \&c. for thes flate of contraction in the folids or valfular parts of the body, which makes then hold fatt their proper contents. In this 1enfe, retention is oppofed to evachation and excretion.

RETICLTAR BODY (corpus reliculare), in anatoany, a very fine membane, periorated, in the manner of a net, witha multitude of foramina. It is placed immediately under the cuticle ; and when that is feparated from the culis, whether by art or accident, this adheres firmly to it, and is fearee pollibie to be parted from it, fceming rather to be its inner fuperficies than a ditlinct fubltance. In regard to this, we are to obferve, firft, the phaces in which it is found, being all thofe in which the fenfe of feeling is moftacute, as in the palms of the hands, the extremities of the fingers, and on the foles of the feet. The tongue, howewer, is the part where it is mof accurately to be oblerved: it is more eafily dittinguilhable there than anywhere elfe, and its mature and fructure are moot evidently feen there.
Its eolour in the Earopeans is white ; but in the negroes and other black nations it is black; in the tawn it is yellowith: the flim iffelf in buth is white; and the blaeknefs and yellownefs depend altogether on the colour of this membrane.
The ufes of the corpus reticulare are to preferve the flruature of the other parts of the integuments, and keep them in their determinate form and fituation. Its apertures give paflage to the hairs and fiveat through the papilix and excretmy ducts of the fkin: it retains thefe in a certain and determinate order, that they cannot be removed out of their places, and has fome fhare in preferving the fofteefs of the papillæ, which renders them fis for the fenfe of fecling. See AnatoMy, $n^{\circ} 8_{3}$.

Reticulum, is a Lalin word, fignifying a little or cafing net. It was applied by the Romans to a particular mode of contructung their briidings. In the city of Salino (fee Salino) are till to be feen remains of fome walls, evidently of Rnman origin from the reticulum. This ftructure confilts of fmall pieces of baked earth cut lozengewife, and difpofed with great regularity on the angles, fo as to exhibit to the eye the appearance of ent diamonds; and was celled reticular, from its refemblance to fifhing-nets. The Komans always concealed it under a regular coatmer of wher mater ; and Mr Houel informs:us, that this was the orly feecimen of it which he faw in all his travels throngh Sicily, Mialta, and Lipari. It appears to b: the remans of fome baths, which
(a)'I' French con eatho, ine of whote principles are equally new, daning, and deftrective of all that is decent or of good report, have decided this quetion in a very fummary waty, by aecreeing ueath to be an etemal heep, a decree crually abfurd in ifelt and latal in its confequences. Since this article w. it to the pref, however, we have learned, from the mont refpectable authority, that wild and ablund as the opinion is, it has been induftioufly propagated in thic coe ury, and that in fome it has gained gromed. The corfequences of this, were it to beconic seneral, mint in ced be baneful beyond all conception; and we fhatlatterwards take occafinn to eapofe the "pinion ard its i.efatious coafequenc:s at greater !ength than it is now poffle to do in this place. See Tubolocs.

Retimo which have been buit for the convenience of fea-bathII ng.
RETIMO, the ancient Rhityannia of Stephen the geographer, and called by Ptolemy Rhitymna, is a fine city, lying at one end of a rich and fertile plain, on the north coatt of the ifland of Candia. It is but a fmall plase, containing fcarce 60 co inhabitatats ; but it is at bifhop's fee, and the harbour is defended by a citadel, where a banhaw refides. It was taken by the Turks in $16+7$, and has been in their hands cver fince. It is about 45 miles fiom Candia. E. Long. 24.45. N. Lat. 35. 22.

The citadel, which ftands on a rock jutting out into the fea, would be fufficient for the defence of the city, where it not fituated at the foor of an high hill, from which it might be eannenaded with great advantage. The harbour is now almolt filied with fand, and is no longer acceffible to fhipping; nor do the Turks in any meafure oppofe the ravages of time, but behold with a carclefs eye the moft valuable works in a tate of ruin. The French had formerly a vice-conful at Retimo, to which fhips ufed to repair for eargoes of oil; but they have been long unable to get into the harbour: to repair which, however, and to rerive the commerce of Retimo, would be a mot ufeful attempt. The plains around the city abound in a variety of productions. Great quantities of oil, cotton, fation, and wax, are produced here; and they would be prosuced in till greater quantities if the inhabitants could export their commodities. The gardens of Retimo bear the beft fruits in the ifland; excellent pomegranates, almonds, piftacho nuts, and oranges. The apricot-tree, bearing the michmich, the juice of which is fo delicious, and its flavour fo exquifite, is found here. It is a kind of early peach, but fmaller and more juicy than thofe of France.

RETINA, in anatomy, the expanfion of the optic nerves over the bottom of the eye, where the fenfe of vifion is firt received. See Anaromy, $n^{\circ}$ 142. and Optics (Index) at Eye and Vifion.

KETINUE, the attendants or followers of a prince or perfon of quality, chiefly in a journey.

RETIRADE, in fortification, a kind of retrenchment made in the body of a battion, or other work, which is to be difputed, inch by inch, after the defences are difmantled. It ufually conlifts of two faces, which make a re-entering angle. When a breach is made in a bation, the enemy may alfo make a retirade or new fortification behind it.

RETIREMENT, means a private way of life or a
Dr Knor. fecret habitation. "Few (fays an elegant writer) are able to bear folitude; and though retirement is the oftenfible object of the greater part, yet, when they are enabled by fuccefs to retire, they feel themfelves unhappy. Peculiar powers and elegance of mind are neceffary to enable us to draw all our refources from ourfelves. In a remote and folitary village the mind mult be internally sctive in a great degree, or it will be miferable for want of emplosment. But in great and populous cities, even while it is paffive, it will be confaintly amurcd. It is impofible to walk the freets without finding the attention powerfully folicited on every fide. No exertion is neceffary. Objects pour themfelves into the finfes, and it would be difficult to prevent their admittance. But, in retirement, there muft be a fpirit of philofophy and a fore of learning,
or elfe the fancied feenes of blifs will vanifh like the colours of the rainbow. Ponr Cowley might be faid to be melancholy mad. He languithed for inlitude, and wilhed to hide himielf in the wilds of America. But, alas ! he was not able to fupport the foliude of a country villare wi:hin a few miles of the metropolis!
"With a virtuous and cheerful faziily, with a few faithful and gond-humoured friends, with a w"ll-delected collection of elegant bocks, and with a competercy, one may enjoy conforts even in the deferted villare, which the city, with all its diverfions, eannot fupply."

RETORT', in chemiltry, an oblong or globular seffel with its neck bent, proper fur diftillation. Sec Che mistry, $n^{\circ} 576$.

In the filth volume of the Tranfarinns of the London Society for the Eticouragement of Arts, F. 96 . we find a paper containing a method for preventing llone retorts from breaking; or flopping them when cracked, during any chemical opsration, without lofing any of the contained fubject. "I have always found it neceffary (fays the writer) to ufe a previous coating for filling up the intertiees of the earth or Aone, which is made by dilfolving two ounces of borax in a pint of boiling water, and adding to the folution as much flaked lime as will make it into a thin pafte ; this, with at cimmon painter's bruth, may be fpread over feveral retorts, which when dry are then ready for the proper preferving coating. The intention of this firlt coating is, that the fubfances thus fpread over, readily vitrifying in the fire, prevent any of the difilling matters from pervading the retort, but does in nowife prevent it from cracking.
"Whenever I want to ufe any of the above coated retorts; after I have charged them with the fubfance to be dittilled, I prepare a thin patte, made with common linfeed oil and flaked lime well mixed, and perfectly plaftic, that it may be eafily fread: with this let the retorts be covered all over except that part of the neek which is to be inferted into the receiver ; this is readily done with a painter's brufh: the coating will be fufficiently dry in a day or two, and they will then be fit for ufe. With this coating 1 have inr feveral years worked my ftone retorts, without any danger of their breaking, and have frequently ufed the fame retort four or five times; obferving particularly to coat it over with the lalt mentioned compofition every time it is charged with freth materials: Before I made ufe of this expedient, it was an even chance, in conducting operations in fone and earthen retorts, whether they did not crack every time; by which means great lots has been fuftained. If at any time during the operation the retorts thould crack, fpread fome of the oil compofition thick on the part, and fprinkle fome pow der of flacked lime on it, and it immediately fops the fil. fure, and prevents any of the diftilling matter from pervading; even that fubtile penetrating fuoflance the folid ph fphorus will not penetrate throughit. It may be applied without any dancer, even when the retort is red hor ; and when it is made a little niffer, is more proper for luting vellels than any other I evcr have tried; becaufe if properly mixed it will never crack, nor will it indurate fo as to endanger the breaking the necks of the reffels when taken off."

RETRACT'S, among horfemen, pricks in a horfe's feet, arifing from the fault of the farrier in driving nails

Reutingen to the 2gth natural order, Campanace. The capfule Christianity, Miracle, Relicion, and Theolo- Revelaticia II is bilocular, the corolla cylindrical, and villous without;
the ftigma bilid.

REUTLINGEN, a handfome, free, and imperial town of Germuny, in the circle of Suabia, and duchy of Wirtemberg ; feated in a plain on the river Eichez, near the Neckar, adorned with handfome public buildings, and has a well frequanted college. E. Long. 9. 10. N. Lat. $4^{8 .} 3 \mathrm{l}$.

REVE, ReETE, or Greve, the bailiff of a franchife, or manor, thus called, cfpecially in the weft of England. Hence fhire-reeve, theriff, port-greve, \&ec.

REVEILLE, a beat of drum about break of day, to give notice that $i t$ is time for the foldiers to arifi, and that the fentrics are to forbear challenging.

REVEL, a port town of Livonia, fiturted at the fouth entrance of the gulph of Fialand, partly in a plain and partly on a mountain; 133 miles fouth-weft of Pe terburg, and 8 ; fouth-ealt of Abo. It is a place of great trade, and holds two fairs je.rrly, which are vifited by merchants from all countries, but particularly by thole of England and Holland. It is a ftrong and a rich place, with a capital harbour. It is furrounded with high walls and decp ditches, and defended by a caftle and flout baftions. It was confirmed to the Swedes at the peace of Oliva, conquered by Peter the Great in 1710 , and ceded to Rulia in $172^{\circ}$. The conquelt of it was again attempted by the Swedes in 1790. The duke of Sudermania, with the Swedifh fleet, attempted to carry the harbour ; but after an obfinate engagement with the Ruflan fleet, he was obliged to give it up; but it was but for a very flort while. He retired about 20 leagues from the hatbour, to repair the damage his fleet had finftained, and to prepare for a feend attack before any relief could be afforded to the Ruffian fleet. As foon as he had refitted, he failed for the harbour, at a league diftant from which the Rullian fleet was difcovered, ready to difpute with the Swedes the entrance. Upon a council being held by the Duke, it was refolved to attack the Ruffians; and the lignals being given, the Reet bore down for the attack, which was maintained for near fix hours with the utmolt fury: at length the Swedes broke the Rufian line, which threw them into much confufion ; when the Swedes, taking the adrantage of the general confufion into which the Reffians were thown, followed them with their whole force into the harbour, where the conlick and carnage were dreadful on both fides, though the Swodes certainly had the worf of it; at the fame time that their fiill and bravery is indiputable.
This valuable place was again confirmed to Ruffia by the peace. Tae governmen: of Revel or Eflhonia is one of the divifions of the Ruflian empire, containing five diftricts. 1. Revel, on the Baltic fera. 2. Baltic-port, about 40 verfts weftward from Revel 3. Habfal, or Hapfal, a maritime tovia. 4. WeifenItein, on the rivulet Saida, about 80 verfis from Revel. 5. Wefenberg, about 100 verlts from Revel, at about an equal diftance from that town and Narva.

REVELA'IION, the aft of reve.ling, or making a thing public that was before unknown ; it is alfo ufed for the difcoveries made by God to his prophets, and by them to the world; and more particularly for the books of the Oid and New Teftament. Sec Biele,

The principal tefts of the truth of any revelation, are the tendency of its practical dontines; its confillen. cy with itfelf, and with the known aitributes of (rud; and fome fatisfactory evidence that it cannot have ben derived from a human fource.

Befure any man can receive a written book as a re. velation from God, he mult be c nvinced that God exits, and that he is poffefled of almighty power, infante wifdom, and prefer jultice. Now thould a biok teaching abfurd or imnoral dôtrines (as many chapter's of the Koran do, and as all the traditionary fyltems of Paganiim did), pretend to be revealed by a God of wirdom and jultice, we maj fately rejeat its pretenfions without farther examination than wiat is necelfary to f:aisfy us that we have not mifunderfood its doetrine. Should a book claiming this high origin, enjoin in one part of it, and furbid in another, the fame thing to be done under the fame circunftances, we may jejest it with contempt and indignation ; hec.sufe a being of infinite wifdom can never aet capricioully or abiurdly. Sill, however, as it is impofible for us to know how fir the powers of men may reach in the inverigation or difcovery of wifeful tru:h, fome farther evidence is neceflary to prove a doctrine of divine origin, than its mere confitency with itfeif, and with the principles of morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doetrines are to be looked for which human reafon cannot fully comprehend ; and thefe are to be beliered on the teftimony of God, and fuffered to produce their practical confequences. At this kind of belief the fhellow infidel may fmile contemptuounly; but it has plice ia arts and feiences as well as in religion. Wheever avails himfelf of the demonftrations of Newtor, Bermouili, and others, refpecting the refiftance of fluids, and applies their conclutions to the :art of Chip-building, is as implicit a believer, if he undertand not the principles of fluxions, as any CbriPtian ; and yet no man will fay that his faith is not productive of important practical confequences. He believes, however, in man, wh:le the Chrittian believes in God; and therefore he cannot pretend that his fuith reits on a furer foundation.
Mr Lecke, in layiry down the ditinet provinces of reafon and faith, obferves, 1. That the fame traths may be difcovered by revelation which are difeoverable to us by reafon. 2. That no revelation can be admitted againft the clear evidence of reafon. 4. That there are many things of which we have but imperfect notions, or none at all; and others, of whofe palt, prefent, or future exiftence, by the natural ufe of our faculties we cannot have the leaft knowledge : and thefe, being beyond the dif:overy of our facultics, and above reafun, when revesled, become the proper object of our faith. He then adds, that our reafon is not injured or difurbed, but affifted and improved by new difcoveries of truth coming frem the fountain of knowledge. Whatever God has revealed is certainly true ; but whether it be a divine revclation or not, reafon muft judge, which can never permit the nind to reject a greater evidence to embrace what is lefs cvi-

RESLILS, enteltaiments of dancing, makking, acting comedics, baress, \&ic. anciently very frequent in the in.:s of cou't and in noblemsit's houfes, but now much dinied. The olficer who has the diredion of the tevels at court is called the Mis rer of the Revels.

REVFAGE, means the return of injary for injury, anddifers materially from that fidden refentment which rute in the mind immedintely on being injured; which, fi) far from being culpable when reftrained within due brunds, is ahfolutely necefintry for felf-prefervation. Rebelige, on the contrary, is a cool and deliberate wickedneis, and is often executed years after the offence was given; and the defire of it is gencrally the effect of listlensis, weaknefs, and vice ; while, to do right, and to fater vrong, is an argument of a great foul, that ficorns to foop to fuggefled revenges.

Revenge is but a frailey incident
Tou craz'd and lickly minds; the poor content Of little fouls, unable to furmnunt
An irjuiy, too weak to bear affront.
Dryden.
Revenge is gencrally the concomitant of favage minds, of minds implacable, and capable of the mon horrid batbarities; umable to fet any limits to their difpleafure, they can confine their anger within no bounds of rearin.

Cruel revenge, which atill we find
The weakeit fraily of a feeble mind.
Degenerous pafion, and for man too bafe,
It feats its empire in the favage race.

## Tuve:nal.

The infitution of law prevents the execution of private revenge, and the growth of civilization fhows its impropricty. Though in modern times a fpecies of revenge is fanctioned by what is called the law of honour, which evades the l.aw of the land indeed, but which is equaily mean and difgraceful as the other kinds, and is of confequences equally binctul. See Anger, Duelbing, and Resentmext.

REVENUE, the annual income a perfon receives from the rent of his lands, houfes, interelt of money in the fock:s, âe.

Royal Reveruf, that which the Britifl conftitution hath velted in the rojal parfon, in order to fupport his dignity and maiutain his power; being a portion which each fubicet contributes of his property, in order to fecure the remainder. This revenue is either ordinary or extraordinary.
I. The ling's crilinary revenue is fuch as has cither fubfilted time out of mind in the crown; or elfe has been granted by pariament, by way of purchafe or exchange for fuch of the king's inherent hereditay $y$ revenues as were found inconvenient to the fubject.In faging that it has fublifted time out of mind in the crown, we do not mean that the king is at pre-
fent in the antural pultellion of the whole of his reve. mue. Mach (nay the y;reateri part) of it is at this day in the hands cf fubjects; to whom it has been grantd out from time to time by the kings of England: which has rendered the crown in fome meafure dupendent on the perple for its ordinary fupport and finb. fiftence. So that we muft be obliged to recount, as part of the royal revenue, what lords of maners and other fuhjests frequently look upon to be their own abrolute rights; becaufe they and their anceftors are and have been velted in them for ages, though in reality originally derived from the grants of our ancient princes.

1. The firt of the king's ordinary revenues, which may be taken notice of, is of an ecclefiaftical kind (as are alio the three fucceeding ones), viz the cutlonly of the temporalities of biflops. See Temporalitirs.
2. The king is entitled to: corody, as the law calls it, out of every bilnopric ; that is, to dend one of his chaplains to be maintained by the bifhop, or to have a pention allowed him till the bilhop promotes him to at benctice. This is alfo in the nature of an acknowledgement to the king, as founder of the fee, fince he had formerly the fame corody or pention from every abbey or priory of roval foundation. It is fuppofed to be now fallen inco total difufe; theugh Sir Matthew Hale fays, that it is due of common right, and that no prefcrip. tion will difcharge it.
3. Thie king al:o is entitled to all the rithes arifing in extraparochial places: though perhaps it may be doubted how far this anticle, as well as the laft, can be properly reckoned a part of the king's own royal revenue ; fince a corody fupports only his chaplains, and thefe extraparo hial tithes are held under an implied truft that the king will diftribute them for the good of the clergy in general.
4. The next branch confifts in the fref-fruits and tenths of all fpiritual preferments in the kingdom. See Tenths.
5. The next branch of the king's ordinary revenue (which, as well as the fubfequent branches, is of a lay or temporal nature) confilts in the rents and profits of the demefne lands of the crown. Thefe demefne lands, terre dominicales regis, heing either the fhare referved to the crown at the original dilitibution of landed property, or fuch as came to it alterwards by forfeitures or other means, were anciently very large and extenfive; compriling divers manors, honours, and lordfhips; the tenants of which had very peculiar privileges, when vie ipeak of the tenure in ancient demefne At prefent they are contrafted within a very narrow compars, having been almoft entirely granted awry to private fubjefts. This has oceafioned the parlianent frequently to interpofe; and particularly after King William 11I. had greatly impoverifhed the crown, an act paffed, whereby all future grants or leafes from the crown for any longer term than 31 years or three lives, are declared to be void; except with regard to honfes, which may be granted for 50 years. And no reverfionary leale can be made, fo as to exceed, together with the eftate in being, the fame term of three lives or 31 years; that is, when there is a fubfiting leafe, of which there are 20 years Eill to come, the king cannot grant a future interefl, to commence after the expiration of the former, for any longer term than it
$\underbrace{\text { Reverue. }}$ ycars. The tenant muft alfo be made liable to be puniffed for cornmitting wafte; and the ufual rent mult be referved, cr, where therc has ufually been no reat, one-third of the clear yearly value. The misfortune is, that this aet was made too late, after almoft cvery valuable poffeffion of the crown had been granted away for ever, or elfe upon very long leafes; but may be of benefit to pofterity, when thofe leafes come to expire.
G. Hi:her might have been referred the advantages which were ufcd to arife to the king from the profits of his military tenures, to which moft lands in the kingdon were fubject, till the flatute 12 Car. II. c. 24 . which in great meafure abolifhed them all. Hither alfo might have been referred the profitable prerogative of purvesance and preemption: which was a right enjoyed by the crown of buying up provifions and other neceffaries, by the intervention of the king's purveyors, for the ufe of his royal houfehold, at an appraifed valuation, in preference to all others, and even without confent of the owner: and alfo of forcibly imprefling the carriages and horfes of the fubject, to do the king's butinefs on the public roads, in the conveyance of timber, baggage, and the like, however inconvenient to the proprietor, upon paying him a fettled price. A prerogative which prevailed pietty generally throughout Europe during the farcity of gold and filver, and the high valuation of money confequential thereupon. In thofe early times, the king's houfehold (as well as thofe of infericr $1 . r d s$ ), were fupported by (pecific renders of corn, and other vietuals, from the tenants of the refpective demefnes; and there was alfo a continual marker kept at the palace-gate to furnifh viands for the royal ufe. And this anfiwered all purpofes, in thofe ages of fimplicity, fo long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another (as was formerly very frequently done), it was found neceffary to fend purveyors beforehand, to get together a fulicient quantity of provifions and other necellaries for the houfehold: and, left unufual demands thould raife them to an exhorbitant price, the powers beferementioned were vefted in thefe purveyors; who in procefs of time very greatly abufed their authority, and became a great oppreffion to the fubject, though of little advantage to the crown; ready money in open market (when the royal refidence was more permanent, and fpecie began to be plenty) being found upon experience to be the beft proveditor of any. Wherefore, by degrees, the powers of purveyance have declined, in forcign countries as well as our own : and particularly were abolithed in Sweden by Guftavus Adolphus, towards the beginning of the laft century. And, with us, in England, having falen into difule during the fufpenfion of monaicly, King Charles at lis reftoration, confented, by the fame ftatute, to refign entirely thofe branches of lis revenue and power: and the parbiarnent, in part of recompenfe, fettied on him, his heirs, and fucceffors, for ever, the hereditary excife of 15 d . per barrcl on all beer and ale fold in the kingdom, and a proportionable fum for certain other liquors. So that this hiteditary excife now forms the fixth branch oit his majelty's ordinary revenue.
6. A ferenth branch might alfo be computed to have

Vol. XVI.
arifen froma mine-licences; or the rents payable to the Revenue. crown by fuch perfons as ar= licenfed to fell wine by retail throughout Britain, except in a few privileged places. Thefe were firt fettled on the crown by the flatute 12 Car. II. c. 25. and together with the hereditary excife, made up the equivalent in value for the lofs fuftained by the prerogative in the abolition of the military tenures, and the right of pre-emption and purveyance: but this revenue was abolifhed by the flatute 30 Geo . II. c. 19. and an annual fum of upwards of L. 7000 per at num, iffuing out of the new ftampduties impofed on wine-licences, was fettled on the crown in its fead.
8. An eighth branch of the king's ordinary revenue is ufually reckoned to onnfift in the profits arifing from his forelts. Sce Forest. Thefe confift principally in the amercements or fines levied for offences againft the foreft-laws. But as few, if any, courts of this kind for levying amercements have been held fince 1632 , 8 Char. I. and as, from the accounts given of the proceedings in that court by our hiftories and law-books, nobody would wifh to fee them again revived, it is needlefs to purfue this inquiry any farther.
9. The profits arifing from the king's ordinary courts of juftice make a ninth branch of his revenue. Aad thefe confift not only in fines impoifed upon offenders, forfeitures of recognizances, and amercements levied upon defaulters; but alfo in certain fees due to the crown in a variety of legal matters, as, for fetting the great feal to charters, original writs, and other forenfic. proceedings, and for permitting fines to be levied of lands in order to bar entails, or otherwife to infure their title. As none of thefe can be done without the immediate intervention of the king, by limfelf or his officers, the law allows him certain perquifites and profirs, as a recompenfe for the trouble he undertakes for the public. Thefe, in procefs of time, have been almoft all granted out to private perfons, or elfe appropriated to certain particular ufes: fo that, though our law proceedings are fill loaded with their payment, very little of them is now returned into the king's exchequer; for a part of whofe royal maintenance they were originally intended. All future grants of them, however, by the flatute I Ann. A. 2. c. 7. are to endure for no longer time than the prince's life who grants them.
10. A tenth branch of the king's ordinary revenue, faid to be grounded on the confideration of his guarding and protecting the feas from pirates and robbers, is the right to royal ffhe, which are whale and furgeon: and theic, when either thrown alhore, or caught near the coalts, are the property of the king, on account of their fuperior excellence. Indeed, our anceftors feem to have entertained a very high notion of the importance of this right; it being the prerngative of the kings of Denmark and the dukes of Normandy; and from one of thefe it was probably derived to our princes.
11. Another maritime revenue, and founded parths upor the fame reafon, is that of shapwrecks. Sce Wreck.

I2. A twelfth branch of the royal revenue, the right to mines, has its original from the king's prerogative of coinage, in order to fupply him wilh materials; and

## に E V

Revenue. therefore thofe mines which arc properly royal, and to mary revenue, or the proper patrimony of the cromn; which the king is entited when found, are only thofe of filver and geld. See Mise.
13. To the fame original may in part be referred the sevenue of treafure-trove. See Treasure-Trove.
14. Waifs. See Warf.
15. Ellays. See Estray.

Ecfides the particular realchs, given in the different articles, why the king thould have the leveral icvenues of 10 yal filh, thipwrecks, trealuse-trove, waif, and chrays, there is alto one general reaton which hidd. For them .111; and that is, becaufe they are lois vicuntia, or gords in which no one ellic can claim a property. And, therefore, by the law of nature, they be longed to the fill occupaut or finder ; and to continu.d under the imperial law. But, in fertling the modern conntutions of molt (f the goveruncats in Europe, it was thought proper (to frevent that Arife and contention which the mere title of occupancy is apt to cicate and centinue, and to provide for the fupport of public authority in a manser the lealk burdenfume to inutviduals) that theferights thould be annexed to the fitpreme power by the pofitive laws of the llate. And to it came to path, th.ns, as Bracton expreffes it, "hxc, "qua nullius in bonis funt, et olim fuerunt inventoris " de jure naturali, j.na efficiuntur pinctpis de jure gen"tium"
16. The next branch ef the king's crdinary revenue contits in forfeitures of lands and goods for offerees; bona confficata, as they are cal'ed by the civilians, becaufe they bel nged to the fificts or imperial theafury; or, as our lawsens term them, foris facta, that i., fuch where f the prop.rty is gone a way or departed from the owner. The true reafon and only fubit:mial ground of any forfiture fir crimes, confit in this; that all property is derived from fociery, being one of thole civil rights which are corferred uf crimdividuals, in ex. change for that degree of natural fied $m$ which every man muft facifice when he enters into docial con munities. If, therefore, a men.ber of any natio ai commurity volates the funcamontal entrad of his, affociation, by tranfouffing the municijal law, lic fotleits his tight $t$ fucl privileges as lee claims by that contrate ; and the fatenay very juflly refume that portion of property, or any purt of it, which the laws have before affigned him. Hence, in every offence of an atrocious kind, the laws of Eigland have exacted a total confifcation of the monealles no perfonal eltate; and, in m.ny cafes, a perpetual, in others coly a temporary, l. fs of the "Trenter's inmoveables or landed property; and have velled them both in he hing, who is the perfen furpofed to be iffended, beirg the one vifille magifrate in whom the maj. Hy of the public re!ides. See Forfeiture and Demdand.
17. Ancther branclo of the king's ordinary revenne arifes from efcheats of lands, which hapl en up. a the defeet of heirs to fucceed to the in hentance; whenc. upon they in general revent to and velt in the king, who is eneemed, in the cye of the lat, the original proprictor of all lands in the kingdom.
18. The laf branch of the king's ordinary revenue, contifts in the cuftody of idints, fom whence we thall be naturally led to confider allo the cuft dy of lunatics. Sec idiot and Lunatic.
This may fuffece for a thort view of the hing's ordi-
which was very large formerly, and capable of being increafed to a magnitude cruly formidable: for there are very few eftates in the kined. m that have not, at fome period or other fince the Norman conquef, been velted in the hands of the king, by forteiture, efcheat, or otherwite. But, fortunately for the liberty of the fubject, this heredtary landed revenue, by a feries of improvideat management, is luak almon to nothing ; and the calua! poofts, arifing Irom the other branches of the cenfus regalis, are likewie almolt all of then alicnated from the crown. In order to fupply the deficiencies of which, we ale now obliged to have recourfe th new mehods of raifing money, unknown to unr eaily anceltors; which methods conflitute.

1I. The king's exifuo dinary revenue. For, the public patrimony beins got into the hands of private fubjef., it is but reafonable that private contributions thould fupply the public fervice. Whict, though it may peah ps fall h.irder upon fome individuals, whofe a'ceitors have had no thare in the general plunder, than upon thers, yer, taking the nation throughout, it ammante to neanly the tame: provided the gain by the extrandinary thould appear to be mo greater than the lois by the ordinary revenue. And perhaps, if every gentionan in the kingdums was to be fripped of fuch if lus lands as were formetly the property of the crown, was to be aydin fubjed to the inconveniences of purveyance and pie-emption, the nppreflion of fo-reit-laws, and the llivery of feodal-tenures; and was to retign int t the king's hands all his royal f.anchifes of waifs, "reck', eltrays, treafure-trove, mines, deodands, forleitures, and the like; he would find himfelf a greater lo.er than by paying his quota to fuch taxes as are necellary to the fipport of gevernment. The thing, therefore, to be wilhed and aimed at in a land of libenty, is by no means the total abolition of taxes, which would diaw after it very pernicinus confequences, and the very fuppofition of which is the lei he of pelitical abfurdty. For as the true idea of government and magitracy will be found to confift is this, that finae few men are deputed ly many others tu prefide over public athairs, fo that individuals may the better be enabled to attend thar private concerns : it is necelfary that thofe individuals thould be bound to contribute a portion of their pivate gains, in order to $\Gamma$ pont that goverumert, and reward that magiflra $y$, which proteas them in the enjoyment of their refpective properties. But the things to be aimed at are willom and moderation, not unly in granting, but alto in the method of raifing, the necelliary fupplies; by contrivins to d , both in luch a manner as may be moll conducive to the national welfare, and at the fame time molt conliftent with economy and the liberty of the fubject; who, when properly taxed, contibutes only, as was befne ob erved, tome patt of his property in oraler to enjoy the rell.

Thele extraordinary grants are ufually called by the fyn mymous names of cids, fubfilies, and fupplies; and are granted by the commons of Great Britain, in parlianemt allembled. Sue Parliamentand l'an.

The clear nett produce of the feveral branches of the sevenue, after all charges of collecting and manadement paid, amounted in the year 1786 to ath ut L. $15 \cdot 397,000$ Exarling, whle the expenditure was found

## R E V

[ 147 ]
R E. V

## Revenuc.

found to be about L. 14,477,000. How thefe immenfe fums are appropriated, is next to be confidered. And this is, firlt and principally, to the pay ment of the intereft of the national debt. See National Debt and Funds.

The refpective produces of the feveral taxes were originally feparate and diltinet funds; being fecurities for the fums advanced on each feveral tax, and for them only. But at laft it became necelfary, in ord.r to aroid confufion, as they multiplied yearly, to reduce the number of thefe feparate funds, by uniting and ble ding them together; fuperadding the faith of parliament for the general fecurity of the whole. So that there are now only three capital funids of any account, the arssregate fund, and the general fund, fo called from fuch union and addution; and the Soutio-Sea fund, being the produce of the taxes appropriated to pay the interelt of uch part of the national debt as was advanced by that comp.ny and its antuitants. Whereby the reparate funds, which were this united, are become mutuai feculities for each other; and the whole produce of them, thus aggregated, liab.c to pay tuch imereft or annuities as were formerly charged upon e:ach diftinct fund: the faith of the legiflature being moreover engaged to fupply any cafual deficiencies.

The cultoms, excifes, and other taxes, which are to fupport thefe funds, depending on contingencies, upon exports, imports, and confumptions, mutt neceffarily be of a vory uncertain amx unt; but they have always been confiderably more than was fufficient to anfwer the charge upon them. The furpluffes, therefore, of the three great national funds, the aggregate, general, and South-Sea funds, over and above the interelt and annuities charged upon them, are directed by ftatute 3 Gen. I. c. 7. to be carried together, and to attend the difpofition of parliament; and are ufually denominated the finking fun:l, becaufe orizinally deftined to fink and lower the national debt. To this have been fince added many other entire duties, granted in fubfequent years; and the annual intereft of the fums borrowed on their refpective credits is charged on, and payable out of, the produce of the finking fund. However, the nett furp!uffes and favings, after all deductions paid, amount annually to a very confiderable fum. For as the intereft on the national debt has been at feveral times reduced (by the conlent of the proprietors, who had their option either to lower their interelt or be paid their principal), the favings from the appropriated reverues muft needs be extremely large.

But, before any part of the aggregate fund (the furplufies whereof arc one of the chief ingredients that furm the finking fund) c.un be applied to diminifin the principal of the public debt, it lands mortgaged by parliament to raife an annual fun for the mainenance of the king's boufehold and the civil lift. For this purpofe, in the late reigns, the produce of cert in branches of the excife and cuftems, the polt.ofice, the duty on wine licences, the revenues of the remaining crown-laids, the pr fits arifing from courts of jultice, (which articles include all the hereditary revcuues of the crown), and alfo a clear annuity of L. 120,000 in money, were fettled on the king for life, for the tupport of his majely's houlehold, and the honour and dignity of the crown. And, as the amount of thefe feveral hranches was uncertain, (though in the laft reign they were computed to have fometimes raifed almoft a
million), if thes did not arife annually to I. So0,000. Reremo the parliament engaged to make up the deficiency. Bat his prefent majety having, foon after his acceffion, fpuatancounly fignificd his confent that his own hereditary revenues might be fo difpofed of as might beft conduce to the utility and fatisfaction of the public, and having gracioully accepted a limited fum, the faid hereditary and other revenues are now carried into, and made a part of, the aggrcgate fund; and the asgregate fund is clarged with the payment of the whole annuity to the crown. The limited annuity accepted by his prefent majefty was at firl L. 800,000 , but it has been fince augmented to L. 900,000 . The expences themfelves, being put under the fame care and management as the other branches of the public patimony, produce more, and are better collected than heretofore; and the public is a gainer of upwards of L. ic0,000 per annunt by this difinterefted bounty of his majefty.

The finking fund, though lorg talked of as the laft refource of the nation, proved very inadequate to the purpofe for which it was eftablifhed. Nirifters found pretences for diverting it into other channels; and the diminution of the national debt proceeded flowly duriag the intervals of peace, whilt each fuccecding war increafed it with great rapidity. To remedy this evil, and re!?ore the public credit, to which the late war had given a confiderable thock, Mr Pitt conceived a plan for diminifhing the debt by a fund, which fhould be rendered unalienable to any other putpofe. In the feflion 1786 , he moved that the anmal forplus of the revenue above the expeiditure fhould be raifed, by additional taxes, from L. 900,000 to one million Stcrling, and that certain commiffioners fhould be vefted with the full power of difpofing of this fum in the purchafe of flock (fee Funds), for the public, in their own names. Thefe commifioners floould receive the annual million by quarterly payments of L. 250,000 , to be iffued out of the exchequer bcfore any other money, except the intereft of the national deht itfelf; by thefe provifions, the fund would be fecured, and no deficiencies in the national revenues could affect it, but fuch muft be feparately provided for by parliament.

The accumulated compound intereft on a million yearly, together with the annuities that rould fall into that fund, would. he faid, in 28 years amount to fuch a fum as would leave a furplus of four millions annually, to be applied, if neceffarg, to the exigencies of the flate. In appointing the commifioners, he frould, he faid, endeavour to chocfe perions of fuch weight and claracter as correiponded with the importance of the commiflion they were to exccute. The fpeaker of the houfe of commons, the chancellor of the exchequer, the mafler of the rolls, the governor and deputy governor of the bank of England, and the accountant general of the high court if chancery, were perfons who, from their feveral fituations, he fhould think highly proper to be of the number.

To the principle of this bill no objection was made, though feveral fpecious but ill-founded ones werc urged againitt the fulficiency of the mode which the chancellor of the exchequer lad adopted for the accomplifhment of fo great and fo delirable an end. He had made it a clauc in his bill, that the accumulating million thould never be applied but to the purchafe of tock. To this claule M: Fox olyced, and moved that the commif.

## R E V

Rebsere
to much of any future loan as they thoutd have calla belonging to the public to pay for. This, he faid, would rel eve that diftefs the country would orherwife be under, when, culaccount of a war, it might be necelfary to a aire a new loan: whenever that thould be the cafe, his opinion was, that the minitter thould not only raite axes fulficiently produatice to pay the interelt of the lwat, but alio faticient to make good to the finking tund whatsoever had been tatien from it.

If, therefore, for inlt.unce, at any furure period a loan of fix millions was propoied, and there was at that time mee million in the hands of the commitioners, in fuch cale they thould take a million of the loan, and the $i$. nus or dutaine thereupon thould be received by thems for the public. Thus grovernment would ouly have tive millions to borrow inftead of fix; and from fuch a mode of praceeding, he faid, it was evident great benefit would arife to the public.

Thes claufe was received by Mr Pitt with the Atongcit marks of approbation, as was likewite another, moved by Mr l'ulteney, enabling the commitioners named in the bill to cuntinue purchating nock for the public when it is above par, unlefs otherwife direned by parliament. With thefe additional claufes the bill was read a third time on the 1 gth of May, and carried up to the Lords, where it alfo palled without meeting with any material oppolition, and afterwards received the royal affent.

The operation of this bill furpaffed perhaps the minifer's mofl fanguine expectation. The fund was ably managed, and judicioully applied; and in 593 the commilfioners had extinguilhed fome millions of the public debt. 'The war, however, into which the nation was that year involved, and of which there is yet no certain profpect of a near end, has made it neceflary to burrow additional fums, fo large, that many years of peace muft clapfe before the operation of the fund can contribute fenlibly to the relief of the people. The clear produce of the taxes raifed on the people of this country was, in the year 1-92, very near L. 17,000,000; and it mult henceforth, from the accumulation of the debt, and the enormous expence of the prefent war, be necelfarily rendered greater.

Revenue, in hunting, a flefhy lump formed chiefly hy a clufter of whitith worms un the head of the deer, fuppofed to occafien the cafting of their horus by guawing them at the root.

REVERIBERATION, in phyfics, the aft of a body repeliing or relleting another after its impinging thereon.

Reverberitiox, in chemiftry, denotes a kind of circulation of the tlame by means of a reverberatory firnacc.

REVERBERATORY, or Revfrberatimg Furmace. Seechemistry-Index at Furnaie, and Furnace.

REVERLDD, a title of sefpect given to cacle-fiafics.-The religi us abroad are called reverend fathers, and abbe.ice, priorefics, Bec.reereml methers. In England, bithops anc rizkt reverent, and archbithop's mojl reverenal. In France, before the Revolution, their bilhops, archbifhops, and abbots, were all alike moft reserent. In Scotland the clergy individually are revesend, a fynod is tery reverond, and the getieral atfermbly is ten.ralle.

REVERIF, the fame with delirium, raving, or diftaction. It is ufed alfo for any tidiculous, extra.

## R E V

vagant imagination, action, or propofition, a chimera, Reverfal. or vition. But the moft ordinary ule of the word anong Englih writers, is for a deep difordeniy mufing or meditation.

REVERSAL of Judgnent, in law. A judgmene may be falfified, reverfel, or voided, in the firft place, avithout a surit of ervor, lor matters foreign to or dehors tbe record, that is, not apparent upon the lace of it; fo that they cannot be affigned for error in the fuperior court, which can only judge from what appears in the record iticlf; and therefore, if the whale record be not certified, or not truly certified, by the inferine court, the party injured thereby (in both civil and criminal cales) may :allege a diminution of the record, and caufe it to be reaified. Thus, if any judgment whatever be given by perfons who had no good commilion to proceed againt the peron condemned, it is void; and may be faltified by flewing the fpecial matter, without writ of error. As, where a commiflion iffues to A and B , and twelve others, or any two of them, of which $A$ or B thall be ose, to take and try indictments; and any of the other twelve proceed without the interpofition or prefence of either $A$ or $B$ : in this cafe all proceedings, trials, convictions, and judgments, are void for want of a proper authonity in the commifioners, and may be falfified upon bare infpection, without the trouble of a writ of error ; it being a high mifdemeanour in the judges fo proceeding, and little (if any thing) mort of murder in them all, in cafe the perion fo attainted be executed and fuffer death. So likewife if a man purchafes land of another; and afterwards the vender is, either by outlawry or his own confefion, convicted and attainted of treafon or felony previous to the fale or alienation; whereby fuch land becomes liable to forfeiture or efcheat : now, upon any trial, the purchafer is at liberty, without bringing any writ of error, to falfify not only the time of the felony or treafon fuppofed, but the very point of the fclony or treafonitfelf; and is not concluded by the confefion of the nutlawry of the vender, though the vender limiclf is concluded, and not fuffered now to deny the fact, which he has by confeffion or flight acknowledged. But if fuch attainder of the vender was by verdict, on the nath of his pcets, the alienee cannot be received to fallify or contradict the fala of the crime committed; though he is at liberty to prove a miftake in time, or that the offence was committed after the alieration, and not before.

Secondly, a judgment may be reverfed, by writ of error, which lies from all inferior crin inal juriddictions to the court of king 's-bench, and from the hing'sbench to the houfe of feers; and may be brought for noterizus mifakes in the judgment or "ther parts of the record : as where a man is fond guily of perjory, and reccives the judgment of felony, or for nther lefs palpable errors; fuch as any irregularity, omifion, or want of form in the precefs of outlawry, or rroclamations ; the want of a proper addition to the defendant's name, according to the flatute of additions; for not property naming the fhesiff or other officer of the court, or not duly deferibing where his county-court was held: for laying an offence, committed in the time of the late king, to be dune againft the peace of the prefent; and for many other fimilar caufes, which (though allowed out of tendernefs to life and liberty) are not much to the credit or advancement of the national juftice. Thefe writs of error, to reverfe judgments in cafe of

## R E V

Reverfal mifdemeanours, are not to be allowed of courfe, but on II fufficient probable caufe fhown to the atorney-general; $\underbrace{\text { Reverfion. }}$ $\underbrace{(11)}$ and then, they are undertood to be grantable of common sight, and ex debito juflitic. But writs of error to reverie attainders in capital cales are only allowed ex gratia; and not without exprefs warrant under the king's fign-manual, or at leaft by the confent of the at-torncy-general. Thefe therefore can rarely be brought by the party himfelf, efpecially where he is attainted for an offence againft the ftate: but they may be brought by his heir or executor after his death, in more tavourable times; which may be fome confulation to his family. But the ealier and more effectual way is,

Laltly, to reverfe the attainder by act of parliament. This may be and hath been frequently done upon motives of compalion, or perbaps the zeal of the times, after a fudden revolution in the government, without examining too clofe into the truch or validity of the errors affigied. And fometimes, though the crime be univerfally acknowledged and confeffed, yet the merits of the criminal's family fhall after his death obtain a rellitution in blood, honours, and eftate, or fome or one of them, by act of parliament; which (fo far as it extends) has all the effect of reverling the attainder, without calling any reflections upon the jultice of the pre. ceding fentence. Sce Aitainder.

The effect of fallifying or reverfing an outhawry is, that the party fhall be in the fame plight as if he had appeared upon the capias : and, it it be before plea pleaded, he thall be put to plead to the indiftment; if, after conviction, he thall receive the fentence of the law; fur all the other proceedings, except only the procefs of outlawry for his non-appearance, remain good and effectual as before. But when judgment, pro. nounced upen conviftion, is falfified or reveried, all former proceedings are abfolutely fet afide, and the party flands as if he had never been at all accufed; reftored in his credit, his capacity, his blood, and his eftates: with regard to which laft, though they be granted away by the crown, yet the owner may enter upon the grantee, with as litule ceremony as he might enter upon a diffeifor. - But he itill remains liable to another profecution for the fame offence: for, the firlt being erroncous, he never was in jeopardy thercby.

REVERSE of a medal, coin, \&c. denotes the fecond or back fide, in oppotition to the head or principal figure.

REVERSION, in Scots law. See Law, $N^{\circ}$ clxix, 1-3.

Reversion, in the law of England has two fignifications; the one of which is an eltate left, which cuntinues during a particular eftate in being; and the other is the returning of the land, sic. after the particular eftate is ended; and it is further faid to be an intercit in lands, when the poffefion of it fails, or where the eftate which was for a time parted with, returns to the granters, or their heirs. But, according to the ufual definition of a reverfion, it is the relidue of an eftate left in the granter, after a particular eftate granted away ceafes, continuing in the granter of fuch an eftatc.

The difference between a remainder and a reverfion confitts in this, that the remainder may belong to any man except the granter; whereas the reverfion returns to him who conveyed the lands, \&\&:.

In order to render the doetrine of reverfons ealy, we Reverfiou. fhall give the following table; which fhows the prefent value of one pound, to be received at the end of any number of years not exceeding 40; difounting at the rate of 5,4 , and 3 per cent. compound intercit.

Agrin, the prefent value of } 10, \mathrm{ecol} \text {. due }\end{gathered}$ in ten years, the rate of interelt being 3 fer cert. is $-7+1 \times 10,0 c 0=744^{1 .}$

Rereksio: of Serios, in algebra, a kind of reverfed eperation of an infinte feries. Sce Series.

REVIMICACAON, in chemiltr, a term ge:erally appliad to the diftillation of quickfiter fiom cimabar.

Conmisstov of REYIEW, is a commiaion fometimes gravited, in extraordinary eafes, to revife the temence of the court of delegates, when it is apprelended they hase been led intu a material error. 'This commilion the hing may gran:, althoush the llatutes $1+$ and 25 Hen. Vill. declare the fentence of the delegates dethinie: bacaufe the fope, as lupreme head by the canon law, ufed to grate fuch conmifion of review; and fuch authority as the pope herctofore exert: d is now amexed to the crown by fatutes 26 Hen. VIlI. c. 1. and : I:l\%.c. \&. But it is not mater of right, which the fubjeat may demand ex debits juflitia; but merely: a matter of favour, ard which therefure is (fien denicul.

Reverew, is the draving cut aii or part of the army in line of bretle, so be viewed by a governor, or a ger.cend, that they may kncw the condition of the troaps.

At ail reviews, the cfficurs fould be properly armed, reads in thir exerc:fe, falute well, in good time, and with a gcodar; their uniform genteel, \&cc. The men fiould be clean and weil dretfed; their accoutrements well put on; very well fized in their ranks ; the ferjeants expert in their duty, drummers perieft in their Le.tinys, and the fiers play correct. The manual exereife mut be performed in guod time, and with life; and the men carry their armo well; march, wheel, and furm with exactnels. All mancuures mult be performed with the utmof regulatity, both in quick and flow time. The firings are generally $3^{6}$ rounds; viz. by companies; by crand diviliors ; by fub-divifions; obliquely, advancing, retreatin? ; by files; in the fquare; ftrect firings, adrancing, and retreating; and lattly, a volley. The intention of a review is, to know the conderion of the tronps, fee that they are complete and feiform their exercifes and cvoluticns well.

Reviey is alfo applied to Litenary Jumals, which give a feriodical vicw of the flate of literature; -as the II nthly Review, the Critical Revicw, the Britilh Critic, a:ad Analytic ol Review, \&ic.

RE-UNION ISLAND, an inand in the South Sea, difeovered by the Frevely on the I Gth Decomber 1773; lyiar, a-coading to M. de Pages, in datitude $4^{S^{0}} 21^{\prime \prime}$ and longitide $65^{\circ} 47$, the vatiation of the necdle being $30^{\circ}$ alwiys towards s.orth-welh. The road and harbour are extrencly good, ard the latter frum 16 en 8 fathoms deep at the very thure. The coalt on each fide is luf1y, but green, with in abrupt defent, and fwarnis wih1 a fpeeres of buthards. The penguins and fea-lions, which farmed on the lands, were nowife alarmed at the apploach of the ie who lauded; from whence M. de l'ages e nclucted that the country was wholly uninhalited. The full produces a kind of gra a s , about five i: ches loag, with a briad black leaf, and feemingly of a rich quality-but there was no veltige of a tues or
human habitation. Sce Travels roand lia Worid by M. Repolution de Pages, Vol. 1II. chap. viii. and ix.

REVOLUTION, in politics, fignifies a change in Lefuition. the cunflitution of a fate; and is a word of different import from revol, with which it is fometimes confoanded. When a peuple wathdraw their obedience from their governors for any particular reafon, withnut overturning the government, or waging an offenfive war againit it, they are in a fate of revolt ; when they overturs the government and form a new one for themfelves, ihey effeêt a rearolution.
'That which is termed the revolution in Britain is the Eritifi Rechange which, in 1688 , took place in confequence of volution. the furced abdication of king James 11. when the Proteltant fircceflion was eftablihed, and the comititution rettored to its primitive purity. Of this important ramdation, which confirmed the reghts and liberties of Britons, we have endeavoured to give an impartial account under another article (fee Britain, no 281, \&c.). Of the rife and progrels of the American revolution, American. which is fill freth in the memory of oar readers, a large detail is given under the article Amerncia: But there are two other revolutions yet pending, of which fume account will be expected in this place.

The Pohifh revolution, which, in all its circumfances, was perhaps the leat exceptionable of any in the recurds of hitory, we have already traced to the period when the amable king, ovctawed by the arms of Ruffla, was obliged to undo his patriotic work, and give his fanction to the reforation of the uld and wretched govirnment (fee Poland). Since that period, Kofciuku's anmy has been completely defeated, himfilf nade a prifoner, Warfaw taken, and the whole kingd $m$ fublued bs the powers combined againft it. What will be the conf quences of this flucefs may per.aps be conceived, but the rumours of the day are valous. At one time we are told, that Poland is to be no lenger an independent flate, but to be divided among the three great powers which formerly wrefted trom it fome of its molt valuable provinces. At another time, we hear of the difinteretted intention of the Emprefs, to reitore the king to his origival authority ; although the has, in the man time, driven him from tis capital, where the herfelf exercifes fovereign power. And a third rep irt days, that Stanillius is to retire with a large pention, and a Rufian prince to Rep into his throne. The firt of thete runours we think inich more probabie than the other twin: : efpecially as it ieem; confinaed by the following letter tent from Grodno, on the 18th of Junuary, by the unfertunate king to the Britilh amballad.r.
"My dear Gardiner-The chatacters with whih you and I have been invetted leem to be now ahmoll at an end. I do not espent to fee you again, but it is of importance to me to bid you darewell; and this I do from the boitum of my heat. You will preicive a phace in my heart till death ; and I hope that :a l. le we thall mect again, in a flace where upright minds, according to niy opinion, will be for ever united.
"Everg thing belonging to the ulual etiquette has been fo much duranged and interrupted by my tad tate, that molt probably aeither fou nur I will be able to fultil the diplomatic entloms.
"But be affured, that I love and honour your king a1. 1

Revolution and nation. This you will apprize them of. Be affured alfo, that I wih jou thould preferve an affection towards your friend. If I am able to fpeak to you no more, my picture will fpeat to you for me! (Signed) Stanislaus Augustus, King."
This fhows, at leaft, the fate of the king; and leaving that of the kingdom to be afcertained by time, we proceed to fulfil a promi'e which we made refpeling another revolution, to whech all the nations of Europe are [til! looking with anxicty and alarm.

When treati g of France u:der a former article, we Atated a few of the more ftrihing hitorical tads which led to the commencement of the revolution; and we now come to trace the feries of trandictions which have natriked its terrble career. In doing this, we thail comprefs our idea as much as peffibie; and cut of the endlefs variety of materials of which the public are in polfeffion, we fhill endeavour to extrat a thort and, if pr:finlo, a tolerably clear detal. For this purpole, however, it will be necellay that we begin, by Itatirg the internal lituation of Frunce at the period immediately preceding the revilution, along with the more obvicus prliti, al circumftances which contributed to the production of that event. The moral hittory of man is always mone important than the mere recital of any phy cal occur rences that may take place in his lot. It is not the tall of a mighty monarch and the difpertion of his lamily; it is not the convullion of empires, and the 'ceans of human bloud which have beeu thed, that render the French revolution peculiarly interefting. Such event, however deplrable, are fal from being withont example in the huftory of mankind. In the pnpu'ous regions of the eaft, where fuperfition and 0.avery have ifways prevailed, they areregarded as forming a part of the ordinary courfe of human atairs; becaule an intrepid and fililul ufurper finds it eafy to intimidate or enfnare millions of weak and credulous men. In Eurnpe the cafe is very different; no adventurer can advance far without encountering thoufands as artful and as daring as himfelf. I venis are not the refult either of blind hisard or of individual ikill; conipiracies or plots produce litte effect. Like other arts, the art of government has been brought to much perfec. on; and an eltablifhed conllitution can only be fhaken by the ftrong convultion produced by national palfuns and efforts. The wonderful fpectacle which we are now to contemplate, is that of a mild and poiifhed penple becoming in an iaflant fanguinary and fierce; a well eltablithed government, celebrated for its dexerity and ik.ll, overturned almoft without a itruggle; a whole nation apparently uniting to dellroy every in Ritution which antiquity had lallowed or education tanght them to re!pect ; a fuperlitious people treating the religion of their fathers with contempt; a ong ennaved peuple, whore very chains had become deal to them, occupied in their public counfe's in the difcuffion of refined, and even vilionary fchemes of freedom: in fhort, $25,002,000$ of perfons fuddenly treading under foot every fentiment and every prejudice that they themfelves had ouce regarded as facred and venerable.
Like the cther nations of Eur pe, Fiance was anciently governed by a barbarnus arittocracy, whole dif: ferent members were feebly united by the authority of a ucceffion of kings deflitute of power or influence. The nobbes, within their own territories, enjojed privi-
leges entirely royal: they made peace and war; they coined mnney; they were judges in the laft refort; their valfals were their flaves, whom they bought and fold along with the lands; the inhabitants of cities, although freemen, were depreffed and poor, depending fo: protestion upon fome tyrannical baron in their n-ighbourhnod. At length, however, by the progrefs of the arts, the cities rofe into confiderable importance, an I their inhabitints, alcng with fuch freemen of low rank as refided in the country, were ennfidered as entitled to a reprefentation in the flates-ger eral of the king. dom, under the appellation of tiers etat, or thirdeffte; the clergy and the nobles forming the two firlt ellates. But the fovereign, having fpeedily become defpotic, the meetirgs of the fates general were laid afide. This abiolute authority, on the part of the crown, was not acquired, as it was in England by the houfe of Tudor, by abolifhin the pernicious privileges of the nobles and elevating the commons; but by filful encroachments, by daring exertions of prerogative, and the ule if a powerful military force. In France, therefore. the monarch was abfolute, yet the nobles retained all their feu. narch was abfolute, yet the nobles retained all their feu-
dal privileges, and the ecclefialtical hierarchs did the fame. The fnllowing was, in a few words, the flate of that country during thefe troo laft cen uris.
The kingdum of France, previous to the revolution, was never was never reduced to one homngeneous mafs. It con- rasuced

 time thics were cacnopt trem manton. The crown had
(1 hate ye.rs attompied to beak thaturh this privilege. 'I'r avoid the darger, the clergy profented to the curre a free gift of a fim of moner tomewhat hort ot a milhonstedinger:ly fire ! car:

The nobinity was n reimal!s the feend rorder of the 1-y the f.- A.atc, but it was in ecaliey the fint. 'I'he nobles amounted to no lefs than 200,000 is number. 'The title and rank defecoded to all the children of the family, but the property to the chect alone: hence vaft multitudes of them were dependent upoa the biunty of the court. 'Shey regarted the ufelul and commercial arts as difturourable, and even the liberal profeftons of the law and phetic as in a great meafure beneath their dignity, dildaniog to intermarry with the families of their profef fors. 'Ihe feudal fyftem in its purity was extremely finseurabic to the production of relpectable gualities in the minds of thote who belonged to the order of the 1.0bles: but the introduction of commerce has rendered i:s cecline cqually unfavourable to that clals of men. Intexd of the ancient patriarchal attachnent between the ferdal chicfain and his rafials, the nobility had become greedy landlords in the provinces, that they might appeat in fplendor at court and in the capital. There, lolt in intrsuc, fenfuality, and vanity, their characters became friroluts and contemptible. Such of the Freach nublelf:, however, as remained in the provinces, regarded "ith indignation this degradation of their order, and ftiil retaised a proud fenfe of honour and of courage, which has always rendered them refpectablc. The order if the robles was exempted from the payment of taxes, - Hhough the property of tome of them was immenfe. The cltates of the prince of Conde, for crample, were थctul L. 200,000 a year, and thofe of the duke of Orleans nearly twice as much. 'The crown had in deed impuied tome tritling taxes upon the nobleffe, which, dowever, they in a great mealure contrived to elude.

Neat to the nobles, and as a privileged order ponef-
fing a fecondary kind of nolizilty of their own, we may mention the parliaments. Thefe were large bodies of racn, in d.fierent provinces, appointed as curts of law tor the adminilitrati in of juffice. In conrequence of the corruption of the officers of fate, the members purchafied their places, which they held for life ; but the fon was ufually preecrect when he olfered to purchafe his father's place. In conferuence of this hat circumftance, the pratiting lawjers had little chance of evir becoming judect. Courts thus conffituted confifted of a motley mixture of old and young, learned and ignorant, men. Juritice was ill adminiftered. Tl.e judges allowod their votes in depending caufes to be openty folicited by the pariies or their friends. No wiie man ever entered i.to a litigation againn a meniber of one of thefe partiaments; no lawy cr would undertake to flead his citufe; it never came to a fuccefstiul illuc, and ufually never came to any ifilie at alll. After the flatesgeneral had fallen into difute, the parliaments acquired a certain degice of political confequence, and formed the only check upon the abfolute power of the crown. The laws, or royal ed e's, before being put in force, were always fent to be regillered in the buoks of the parlianients. T.aking advamtage of this, in favourable tines and circumbltances, they ofiten celayed or refuied to regifet the rojall cdicts, and prefented remonfrances

K E V
againlt ther. This was done under a kind of legal Revolucion fition: for they preten'ed that the chnoxious ediat being injuritus to the public happinefs, could not be the will of the kins, but mult either be a forgery or an impolition by the ninillars. Thefe objchions were got the better of, cither by or pofitive order from the king, or by his coming in perfon and ordering the cdiat to be regittered. 'The parliaments, however, often carricd their oppofition wery far, even to the fuin of themfelves and their families as individuals. 'This sendered them extremely popular with the nation, and cnabled then to embarrafs a weak adminiftration. After all, howcver, the oppofition of the partiaments was fo feeble, that it was never thought worth while to abolith them entirely till toward: the end of the reign of Lonis XXV. but they were reflored as a popul:tr mealfure at the begiming of the 1 eign of Louis XVI.
The tiers ctiz, or commons, formed the lowelt order And the of the flate in France, and they were depreffed and mi- commons ferable in the cxircme. To form a conception of their or tiersetat fituation, it is neceflary to obferve that they borc the the lowent whole pecuniary burdens of the llate: They alone were hable to taxation. An expenfire and ambitious hurdens on court ; an army of 200,000 men in time of peace, and the comof twice that number in war ; a confiderable marine efta- mons.
blifhment, public roads and works, were all fupported exclufively by the lowell of the people. To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain fum, over and above which they not only acquired immenfe fortunes to themfelves, but were enabled to advance enormous prefents to thofe favourites or miftrelfes of the king or the ninifter, by means of whom they procured their places. To raite all this moncy from the people, they were guilty of the cruellef oppreftion, having it in their power to obtain whatever revenue laws they pleafed, and executing them in the fevereft manner. For this lait purpofe they kept in pay an army of clerks, fulsalterns, fonts, and fies, amounting to 80,000 men. Thefe men were indeed detefted by the king, whom they deceived and kept in poverty; by the people, whom they oppreffed; and by the ancient nobility, as purfe proud upltarts. But the court of France conld never contrive to manage without dhem. The peafats could be called out by the intendants of the privinces in what they called corveres to work upon the high roads for a certain number of days in the year, which was a fource of fevere oppreffion, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any commutation in money. They were moreover fubject to the mobles in a thoufand ways. The nobles retained all their anciont manerial or patrimonial juridictions. The common people leeing anciently flaves, had cbtained their freedom upon difierent conditions. In many places they and their polierity remained bound to pay a propetual tribute to their lendal lerds. Such tributes formed a conliderabie part of the revenue of many of the provincial mobles. No man could be an officer of the army, by a late rerulation, who did not produce pre ofs of 1:obility for four seneraltions. The parliaments, although originally of the tiers ci,t, attempted alfo to introduce a male that mone but the noblefic fould be almitce! into the:r craler. In fuch a fituation, it will not be atcounted furpifing that the common people of France were extremely fupe:1ti-

## REV [153] REV

French tious and ignorant. They were, however, paffionately Revolution devoted to their monarch, and whatever concerned him. In 1754, when Louns XV. was taner ill es Metz, the whole nation was truly in a kind of de:pdir. The courier and his horfe that brought the news of his recovery to Paris were both almoft fuffocated by the embraces of the people.

We have faid that the French monarch was defpotic. His power was fupported by his armer and by a watchful police, having in pay an infinite hoft of fipies and other fervants. In France no man was fafe. The fecrets of private families werc fearched into. Nolhing was unknown to the jealous inquigion of the police. Men were feized by leltres de cachet when they lealt ex. peited it, and their frmilies had no means of difcovering their fate. The fentence of a court of law againft a nobleman was ufually reverfed by the minifter. No book was publifhed without the licence of a cenfor-reneral appointed by the court, and the minifter was accountable to none but the king. No account was given of the expenditure of the public money. Enormous gratifications and penfions were given as the reward of the moft infamous fervices. The fupreme power of the fate was ufually lodged with a favourite miftrefs, and fhe was fometimes a woman taken from public proftitution. This was not indeed the cafe under Lonis XVI. but it was neycrthelefs one of the miffortunes of his life that he was far from being abfolute in his own family. Still, however, with all its faults, the French court was the monf filendid and polifhed in Europe. It was more the refort of men of talents and literatnre of every kind, and there they met with more ample protection, than anywhere elfe. The court was often jealous of their productions, but they met with the moft diftinguifhed attention from men of fortune and rank; infomuch that for a century paft the French have given the law to Europe in all queftions of tafte, of literature, and of every polite accomplifh. ment. The gay elegance that prevailed at court diffufed itfelf through the nation ; and amidft much internal mifery, gave it to a foreigner the appearance of happinefs, or at leaft of levity and vanity.

Such as it was, this government had finod for ages, and might have continued, had not a concurrence of caufes contributed to its overthrow. The inferior orders of clergy, excluded from all chance of preferment, regarded their fuperiors with jealoufy and envy, and were ready to join the laity of their own rank in any popular commotion. The inferior provincial nobleffe beheld with contempt and indignation the vices and the power of the courtiers, and the higher nohility wifhed to diminith the power of the ercwin. The pradtifing lawyers, almolt entirely c.xcluded from the chance of becoming judges, wifhed eagerly for a change of affairs, not doubting that their talents and profeffional fkill would render them neceffary amidft any alterations that could occur. Accordingly, they were the firft inftruments in producing the revolution, and have been its molt ative fupporters. The monied intereft wilhed eagerly for the downfal of the ancient nobility. As fo: the great mafs of the common people, they were too ignorant, too fuperfitioufly attached to old eftablifh. ments, and tio much depreffed, to have any conception of the nature of political liberty, or any hope of obtaining it. We have already fated the leading circumVol, XVI.
ftances which led to the French revolution (fee Prance, $\mathrm{n}^{0}{ }^{1} 8_{4}, S^{2} .$. ); but there were other circumftances which contribited in an equal degree both to its commence. ment and iss progrels.

For 40 years the principles of liberty had been difeminated with eagernefs in France by fome men of great talents, as Rouffeau, Helvetius, and Raynal, to whom the celebrated Montefquieu had led the way. Belides thefe, there was in France a vaft multitude of what were called men of letters, or perfons who gave this account of the mannicr in which they fpent their time. All thefe were deeply engaged on the fide of fome kind of political reform. The men of letters in Paris alune are faid to have amounted to 20,000 . One of the laft ants of the adminitination of the archbifhop of Thouloufe was, on the 5 th July 1788, to publifh a refolution of the king in council, inviting all his fubjects to give him their advice with regard to the flate of affairs. This. was confidered as a concelfion of an unlimited liberty of the prefs; as it is fearcely pofible to form an idea of the infiuite variety of political publications which from that period diffufed among the people a diffatisfaction with the order of things in which they had hitherto lived.

The eftablifhed religion of France had for fome time palt been gradually undermined. It had been folemnly affaulted by philofophers in varions elaborate performances; and men of wit, among whon V'oltaire took the lead, and attacked it with the dangerous weapon of ridicule. The Roman Cathulic religion is much expofed in this refpeet, in confequence of the multitude of falfe miracles and legendary tales with which its hiftory abounds. Without difcriminating betwizt the refpectable principles on which it refts, and the fupertitious follies by which they had been defaced, the French nation learned to laugh at the whole, and rejected inltead of reforming the religion of their fathers. Thus the firt order in the fate had already begun to be regarded as ufelefs, and the minds of men were prepared for important changes.

The immenfe population of the city of Paris, anounting to upwards of 800,000 fouls, rendered it an important engine in the hands $c_{i}$ the conductors of the revo. lution. An overgrown capital has always proved dangerous to a government that is or attempts to be defpotic, as appears from the hiftory of ancient Babylon and Rome, as well as of modern Conftantinople, of Loadon under Charles I. and Paris under feveral of its kings.

We cannot here avoid mentioning a phyfical event, which affifed not a little in producing many of the convulfions attending the revolution, a general fcarcity of grain, which occurred about that period. On Sunday the 13 th of July $1-88$, about nirie in the morning, without any eclipfe, a dreadful darknefs fuddenly overfpead feveral parts of France. It was the prelude of fuch a tempeft as is unexampled in the temperate climates of Europe. Wind, rain, hail, and thunder, feem. ed to contend in impetuofity; but the lail was the great inftrument of ruin. Inllead of the rich profpe?s of an early autum, the face of nature in the $f_{p}$ :ace of an hour prefented the dreary afper of univerfal winter. The foil was converted into a morars, the fanding curn beaten into the quagmire, the vines broken to pieces, the fruit trees demolifhed, and unmelted hail lying in heaps like rocks of fulid ice. Even the robult
foret

French freen trees were unable to witl:nand the fury of the Kevolution tempett. The hail was conpofed of enormous, fulid, $1 ; 82$. and ansular pieces of ice, fome of them wrighing from eight to ten ounces. The country people, beaten down in the lields on their way to cliurch, amidth this concurfion of the elements, concluded that the l.ott diey was arrived; and farcely attempting to extricate themielves, l.ty delpairing and half fuffocated amidth the water and the mud, expectints the immediate diffolution of all things. The fiom was irregular in its cevalations. White feveral rich dittricts were laid entirely watte, fome intermediate portions of country were compata-
 a lingle ear ot corn or a fruit of any kind lect. Of the 66 p.rithes in the dittriat of Puntoife, +3 were entirely defolated, and of the remaining 23 fome loft wo-thirds and others half their harvelt. The ifte of France, being the diftrit in which Paris is fituated, and the Orleannois, appear to have fuffered chiefly. The damage there, upon a moderate eftimate, amounted to io, 00,000 of livres, or between three and four millions Sterling. Such a calamity mult at any period have been feverely felt; but occuring on the eve of a creat political revolution, and amidfe a general fcarcity throughout Europe, it was peculiatly unfortunate, and gave nore embarraliment to the government than perlaps any other event whatever. Numbers of lamilies found it necelfary to contract their mode of living for a time, and to dimifs their fervants, who were thus left deflitate of bread. Added to the public difcontent and political difenfions, it produced fuch an effect upon the people in general, that the nation feemed to have changed its charater ; and inftead of that levity by which it had cver been diftinguilhed, a fettled gloom now is leemed fixed on every countenance.
allemptio The fipring of the year ${ }^{3} 789$ was a period of much reluce the power of the crown iil frring 3; $3 \%$. political ansiety in France. The fuperior orders with. ed to reduce the power of the crown, but were jealous of their own privileges, and determined to retain them; while the popular philofophers and others were endeavouring, to render them odious, and to roufe the people to a love of irecdom. Still, however, the great body of the common people rem?ined catelef, fyedators of the Atruggle and uriconfcious of the approaching com. notion. Such was their indeference, that few of them thok the trouble cven to attend and vote at the elections nit the deputies to the flates-genc:al. In many places, where a thonfind voters were expected, not filty came forward; but fuch of them as did appear flowed that a feed was fown which $m$ ght one day rife into important fruits. In the inftrucioas which they gave to their edputies, we Eriifh conttiution was in general the model of what they wifhed their government to be. They demanded equal taxation, the abulition of leltres decaclet or arbitrary imprifonment, the refponfibility of miniters, and the extination of the feudat privileges of the mobes: but they willed that the whole three orders of the ftate flomld fit and wote in one houfe, well knowing that their in bility were not prepated to at the maderate part on the Britith houfe of lords. The nobles, on the contrary, although willing to renounce fome of their pecuniary privile ies, and to f.arifice the power of the crown, were molt decifivily refulved neither to furrender their fendal prerogatives nor the right offting in three feparate alfemblies; by means of which
each of the orders conld cafily refift the encroachment Frencu of the other two. Mr Neckar has been improperly cen- Revolution fured for not deciding this laft important queltion pre- $\underbrace{1: 89}$ vious to the meeting of the itates-general: but ic mult be obferved, that the very purpofe of calling that affumbly was to overturn the unjuft privileges of the higher orders through its medium, and without any diroct inter polition on the part of the minilkers. Had the king politively decided in favour of three chamber:the nobles and the clergy would have sctained all thofe ancient abufes eltablitined in their own favour, of which it was his with to deprive them, and the cruwn and its prerogatives would have been the only objeas of facrificc. It was thercfore thought fafer to leave the fiers ctat to fight its own battle: nor was it yet imagined that the commons of France, deprefifed and poor, and diperfed by fituation over a multitude of provinces, could ever unite in enterprifes dangerous to the fovereign.

The flates had been fummoned to meet at Verfailles statesfume on the $27^{2}$ h of April, and moft of the deputies arrived noned to at that time; but the clections for the city of Paris not being concluded, the king deferred the commencenent of their fellions till the $4^{\text {th }}$ of May. During this period, the members, left in idlenefs, began to find out and form acquaintance with each other. Among others, a few members from Brittany (Bretagne) formed themfelves into a club, into which they gradually admitted many other deputies that were found to be zealous for the popular caufe, and allo many perfons who were not deputies. This fociety, thus originally eftablifhed at Veriailles, was called the Comité Bretonn and was one day dellised, under the appellation of the $\mathcal{Y}$ acobina Club, to give laws to France, and to diffufe terror and alarm throughout Europe. On the uther fide, the ariltocratic party eltablithed conferences at the houfe of Madame Polignac, fur the purpofe, it is faid, of uniting the nobles and the clergy.

An event oscurred at this time which all parties afcuibed to fome malicious motive. In the populous fuburb of St Antoine, a M. Reveillon carried on a great paper manufactory. A false report was fpiead that he intended to lower the wages of his workmen, and that he had declared bread was too good for them, and that they might fublift very well on potato-four. A commotion was raifed, he was burnt in elfigy, and his houfe was thercafter burnt and pillaged by the mab, who were not difperfed till the military had been called in, and much camage enfued. The popular party aller tea that the commotion had been artiully excited by the party of the queen and the Count D'Artuis, to afford a pretence for brin~ing great bodies of the military to the neighbourhood in overave the fates-gencral, or induce the hing more decilively to refolve on atfembling that body at Verailles, in preference to Paris, where they and the popular minitter M. Neckar wifhed it to be held.

Un the $4^{\text {th }}$ of May the flates-general affembled at Verfailles. They commenced bufinefs by going in a tolemn procelion, preceded by the clergy, and f.llowcd by the king, according to ancient cultom, to church, to perform an at of devotior. The nobles were arrayed in a fplendid robe, and they and the higher clergy glitered in gold and jewels. The commons appeared in black, the drefs belonging to the law. The affembly

## R E V <br> K E V

Ireuch afiembly was thereafter opened by a fhort fpeech from Revolution the throne, in which the king congratulated himfelf up$\underbrace{1789 .}$ $\underbrace{1 / 8,}$ on thus meeting his people affembled; alluded to the national debt, and the taxes, which were feverely felt becaufe unequally levied; he took notice of the general difcontent and firit of innovation which prevailed, but declared his confidence in the wifdom of the alfembly for reniedying every evil. "May an happy union (added he) rcign in this affembly; and may this epocha bcome ever memorable for the happinefs and profperity of the country. It is the wifh of my heart ; it is the molt ardent defire of my prayers; it is, in fhort, the price which I expect from the li cerity of my intentions and $m y$ love for $m y$ people."
M. Barre:in, the keeper of the fe.ls, next addreffed the alfembly in a congratulatory and uninterelting fpeech. He was followed by the popular minifter M. Neekar, who fpoke for three hours. Though much applauded on account of the clear financial details which his feech contained, he encountered a certain degree of cenfure from all parties, on account of the cantious ambiguity which he obferved with regard to the future proceedings of the flates-general.

Next day the thrce orders affembled feparately. The Their de- deputies of the ticrs etal amounted to 600 in num. pates and inactivity. ber, and thofe of the nobles and clergy to 300 each. During their firf fittiing much time was fpent in unimportant debates about trifing points of form; but the firft impostant queftion, that neceffarily became the fubject of their difculion, was the verification of their posvers, or production of the commiflions of the memoers, and inveftigation of their authenticity. The commons (liers etat) laid hold of this as a pretext for opening the grand controverfy, whether the Itates-general fhould fit in one or in three feparate chambers? They fent a deputation inviting the nobles and the clergy to meet along with them in the common hall for the purpofe of verifying their powers in one common affembly. In the chamber of the clergy in 4 members voted for the performance of this ceremony in the general affembly; and 133 againft it. But in the more haughty order of the nobles, the refolution for the verification in their own affembly was carried by a majority of 188 againft 47. The commons paid no regard to this. They were conducted by bold and fkilful leaders, who difcorned the importance of the point in conteft, and refolved not to abandon it. Aware of the exigencies of the flate, they knew that the crown was nearly verging upon bankruptey; and that fuch were the deficiencies of the revenue that only a fhort delay was necelfary to accomplilh the abfolute diffolution of the government. They fufiered five weeks to pafs away therefore in total inadivity. During this period propofals were made on the part of the miniftry for a pacification between the three orders, and conferences were opened by com. mifioners from eacls. But no art could feduce the commons from their original purpofe, or prevail with them to enter upon the bulinefs of the fate.
Topularity The nation had expected much from the affembling of the Tiers Etat or commoas.
larity. They admitted all perfons promifcuoufly into French the galleries, and even into the body of their hall. No Revo ution renraint was attempted to be laid upon the molt vehe- $\quad$ r- $-\%$. ment marks of popular applaufe or cenfure. Lifts of the voters names were publicly taken and fent to Paris upon every remarkable occafion; and the members fud. denly found themfelves become, aceording to their po. liticill fent:ments, the objects of general execration or applaufe. The new and bold notions of liberty that were daily advanced by the leaders of the tiers ctat were received with acclamation by their hearers. The capital became interefted in the iffue of every debate; and the political fervor was eagerly imbibed by the nation with that vivacity which is fo peculiar to the French. The commons accufed the nobles of obftinately impeding the bufinefs of the fate, by refufing to verify their powers in one common affembly. The accufation was iwal!owed by the multitude, who faw not, or were unwilling to fee, that the attack was made by their own farourite order. In the mean time the nobles became rafidly more and more unpopular. Their perfons were infulted, new publications daily came forth, and were greedily bought up, which reviled their whole order, and reprefented them as an ufelefs or pernicious bod, of men, whofe exifence ought not to be tolerated in a free flate. Whoever adhered to them was branded with the odious appellation of Arijfocrate. The clergy, from the influence of the parifh curés or parfons, feemed ready to defert their caufe They were ever oppofed by a minurity of their own body, which derived luftre from having at its head the duke of Orleans, the firf princ: of the blood. Still, however, the majority of the nobles remained firm; well aware, that if they once confented to fit in the fame affembly, and to vote promifcuoully, with the ambitious and more numerous body of the commons, their whole order, and all its fplendid privileges, muft fpeedily be overthrown.
The leaders of the commons faw the change that was taking place in the minds of men; and they at vantage of length regarded the period as arrived when they ought this poputo emerge from their inactivity, and execute the daring larity, they project of feizing the legiflative authurity in their country. They declared that the reprefentatives of the nobles and the clergy were only the deputies of particular incorporations whom they would allow to fit and vote along with themfelves; but who had no title in a collective capacity to act as the leginators of France. For conducting bufinefs with more facility, they appointed 20 committees. In confequence of a propofal by the Abbé Sieyes, a final mellage was fent to the privileged orders requiring their attendance as individuals, and intimating that the commons, as the deputies of 96 out of every hundred of their countrymen, were about to atfume the exclufive power of l:gilation. Noue of the nobles obeyed this fummonts; but three curćs, Mefirs Cefve, Ballard, and Jalot, prefented their commifions, and were received with loud acclamations. They were next day followed by five more, among whom were Meflis Gregoire, Dillon, and Bodineau. After fome debate concerning the appelliation which they ought to alfume, the conmons, with fuch of the clergy as had joined then2, folemnly voted themfelves the fovercign legiflators of their conntry under the name of the National Afembiy. The refult of the vote was no fooner declared, than the ball refounded

 thear own fovercigh: !e.a der the falegard aind lionour ob Erench motiono
Sajority of The popular caufe now gained ground fo falt, that the clergy on the 19th of June a majosity of the clergy voted for unate with then.

24 perceived that they muft inftantly make a decifive ftand, or ficld up their caufe as finally lon. Such was their alarm, that M. d'Elpremenil propofed, at one of the fittings of their order, to addrefs the king, intreating him to difolve the ftates-general. Hitherto that prince had gone along with M. Neckar in favouring the popular caufe in oppofition to the ariftocracy. Dut every art was now ufed to alarm his mind upon the fubjert of the late affumptions of power on the part of the commons, and thefe arts were at length fucceistiul. Repeated couniels were held; M. Neckar was abient attending a dying fifter, and the king was prevailed upon to act agreeably to the advice of the leaders of the nobles. Bat the firft meature which they adopted was fo ill conducted as to afford little profpent of final fuccefs to their caufe. On the 2oth of June, *:hen the prefidert and members were about to enter as mial into their own hall, they found it unexpectedly firrounded by a detachment of the guards, who refufed then admiftion, white the heralds at the fime time proclumed a royal teflion. Alarmed by this unforeteen ever.t, the meaning of which they knew not, bot appratending that an immediate difi lution of the affembly Wals defigne:, they inllantly retired to a neighbouring tennis-court, where, in the rehemence of their enthufrainn, they took a folemu oath " never to feparate till the contlintion if their country thould be completed."

O: the $22 d$ a now procianiation intimated that the royal felfion, was deferred till the following day. It was now found that the affombly hat been excluded fonn their hall merely becaufe the workmen were ocend ied in prep.ring it for the intended folemnity. This infermation was ill calculated to excite tavourable expectations of the meafures about to be adopted at at an the cturch of sili.ouis. royal fefion, ulherud in by fuch circumanees of marked dfrefpesf fer the repretentatives of tive people. The atembly, after wadedering abe ut in farch of a place of inceting, at leng $\%$ entered the church of St Louis, and were immediatcly joined by the majority of the clery, with their prelident, die archbihop of Vienne, at their head. 'Two nohles of Duphiné, the marquis de Blaçnand the count d'Asoult, profented their com-

milions at the fame time. Encouraged by thefe events, and by the applufes of fursounding multitudes, the affembly now expected with firmess the meafures about Frencis | 1789. |
| :--- | to be adopted.

'The royal fellion was lield in the mof fplendid form, Difcourfe but altogether in the fyle of the ancient defpotifm. of the king Soldiers firrounded the hall. The two fuperior orders were foated, while the reprefentatives of the people, left flanding a full hour in the rain, were in no humour, when at latt admitted, to receive with much complacency the commands of their fovereign. The king read a difcourle, in which he declared null and void the refolutions of the 1 , th, but at the fame time prefenterl the plan of at conflitution for France. It contained many good and patriotic principles, but preferved the diftinction of orders, and the exercife of letires de caschot; it faid nothing about any active fhare in the legillative power to be polfeffed by the fates-general, and was filent both about the refponfibility of minifters and the liberty of the prefs. The king concluded by commanding the deputies immediately to retire, and to affemble again on the following day. He then withdrew, and was followed by all the nobles and a part of the elergy. The commons remained in gloomy filence on their feats. It was interrupted by the grand matter of the ceremonies, who reminded the prefident of the intentions of the king. Infantly the vehement count de Mirabeau, flarting from his feat, exclaimed with indignation, "The commons of France have determined to debate. We have licard the intentions that have been finggetted to the king; and you, who cannot be his agent with the ftates-reneral, you who have here neither feat nor voice, nor a right to fpeak, are not the perfor to remind us of his dpeech. Go tell your mafter, that we are here by the power of the people, and that nothing fhall expel us but the bayonet." The applaufe of the alfembly feconded the enthufiam of the orator, and the matter of the ceremonies withdrew in filence.
M. Camus then rofe ; and in a violent fpeech indig- nob 29 nantly figmatifed the royal fetlion by the obmosinis ter the appellation of a bed of jufice; he consluded by moving king's dethat the afiembly thonld declare their unqualified adhe-parture. rence to their former decrees. 'l'his motion was followed by another, pronouncing the perfons of the deputies inviolable. Both were lupported by Meflrs Petion, Barnave, Glaizen, the Abbés Gresoire, Sieyes, and many others, and were unanimonily decreed. 'The atlembly therefore continued their fittings in the ufual furm. On the lollowing day the majority of the clergy attended as members; and on the 25 th the duke of Orleans, along with 49 of the deputies belonging to the order of nobles, joined them alio. The remaning nobles, as well as the inall minurity of the elergy, now lound themfelves ankwardly fituated. Whether un this account, or becaufe their l aders had by this time formesl a plan for carrying their point nut by peaceable means but by the aid of a milatary force, the king, on the 27 th, invited by a proffing lotter both orders to join the conmons. "lhais requell was imnediate.y complicd with, althongh many of the nobility ditipproved of the me.dine.

The lituation of Trance was now become eruly arm 30 ing. When the king retired from the affembly after fituation of the royal feffion, he was followed by more than 6000 [rance at
citizens, this geriod.

French citizens, from whom loud clamours and every mark of Revolution difapprobation broke forth. All Verfailles was fpeedily 1789.

31 Numerous feditious publicatious.
in an uproar. M. Neckar had repeatedly folicited his difmiffion, and the report of this had increafed the popular clamour. The court was in confernation. The king probably difcovered, with no great farisfaction, that his miniter was more popular than himfelf. At fix o'clock in the evening the queen fent for M. Neckar. When he retarned from the palace, he affured the crowd that waited for him that he would not abandon them; upon which they retired fatisfied. At the fame time the news of the royal feffion had thrown the city of Paris into violent agitation. The peace of that capital was at this time endangered by a variety of caufes. A dreadful famine raged tirrough the land, which in a great city is ufually moft feverely felt. This prepared the minds of men for receiving unfavonrable impreffions of their political fate. Every effort was moreover made to diforganize the government, and produce a dillike to the ancient order of things. The prefs poured forth innumerable publications, filled with new and feducing, though generally impradicable, theories of liberty. Thefe were diftributed gratis among the bulk of the people of Paris, and difperfed in the fame manner through the provinces. Philip duke of Orleans (prefumptive heir to the crown failing the children and brothers of the king) is with good reafon believed to have fupplied this expence out of his more than royal revenues. In the gardens of the Palais Royale at Paris, which belonged to him, an immenfe multitude was daily affembled, liftening from morning till night :o orators who defcanted upon the molt violent fubjects of popular politics. Many of thefe orators were fulpected to be in his pay. It was even believed that his money found its way into the pockets of fome of the moft diftinguifhed leaders in the national alfembly.

But the government was, if poffible, fill more danof the mili:- geroufly allaulted by the methods now generally ufed tary. to feduce the military. Every officer of the French army belonged to the order of the nobles; and from that quarter, therefore, it might have been imagined that there was little dauger. But this very circumlance became the means of diforganizing that great engine of defpotifm. As the foldiers conld not avoid inbibing fome of the new opinions, their own officers became the firt objects of their jealoufy: efpecially in onnfequence of that impolitic edist of Louis XVI. which required every officer to produce procfs of four dagrees of nobility; and thus infulced, by avowe sly excluding the private men from promotion. Perhaps with a view to what might happen, the infructons to the deputies of the tiers ctat had recommended an increare of the pay of the foldiers. And now at Patis every att was ufed to gain them to the popular caufe. They were conduacd to the Palais Royal, and were there careffed and fiattered by the populace, while they liftened to the popular harangues. Thefe arts were fuccefsful. On the 23 d of June they firt refufed to fire on the mob in a riut. Some of them were on the 30 th reported to be
in confinement for this offence; a crowd inftantly collected, and refued them, the dragoons that were brought to fupprefs the tumult grounding their arms: a deputation of the citizens folicited of the affembly the pardon of the prifoners. The affembly applied to the king, who pardoned them accordingly.

All thefe events, together with the tumultuous flate The miliof the capital, which was daily increafing, made it ne-tary called ceffary for the king to call out the military force to out. reftore, if poffible, the public peace. That his intentions were pure, the then ftate of affairs will permit of but very little doubt; but the arifocracy, with the Count d'Artois at their head, were bringing for ward other meafures, which ultimately contributed to the ruin of themfelves, the king, and the kingdom. Crowds of foldiers were collected from all parts of the kingdom around Paris and Verfailles. It was obferved, that thefe confifted chiefly of foreign mercenaries. Camps were traced out. Marfhal Broglio, a tried veteran, was fent for and placed at the head of the army. The king was fuppofed to have entirely yielded to new counfels, and every thing bore the appearance of a defperate effort to reftore the energy of the ancient government. This is the moft important period of the French revolution ; yet the fpecific defigns of the leading actors have never been clearly undertood. It was rumoured at the time, that Paris was to be fubdued by a fiege and bombardment; that the affembly was to be diffolved, and its leaders pat to death. Thefe are incredible exaggerations; but the crifis of French liberty was univerfally regarded as at hand, and alfo the exiftence of the national affembly as an independent bndy; or at leaf upon any other footing than that propofed by the king on the 23 d of Juac.

An able and eloquent addrefs to the king againf the The affemaflemblage of foreign troops in their neighbourhood bly addrefs was brought forward by Mirabeat, and voted by the allembly. The king quickly replied, that the fate of reninve the capital was the caufe of affermbling the troops, and which is offered to transfer the ftates-general to Noyons or Soif- refufen. fons. "We will neither remove (exclaimed Mirabeau) to Noyons nor to Soifons; we will not place ourfelves between two hoflile armies, that which is befieging Paris and that which may fall upon us from Flanders or Alface ; we have not afked permifion to run away from the troops; we have defired that the troops fhould be removed from the capital."

Thirty-five thoufand men were now ftationed in the neighbourhond of Paris and Verfailles. The polts whe occupied which commanded the city, and camps were marked out for a grcater force. The Count d'Artois and his party regarded their plans as ripe for execution ; and M. Neckar received a letter frorn the king, requiring him to quit the kingdom in 24 hours. That popular (A) miniter took the route of Bruffels on the following day, when his departure was made public. In his difmifion the popular, or as it was now called the democratic, party thought they fiw the refolution adopted to accomplifh their ruin. The allemblv agrin 34 addreffed the throne; they requefted anew the remova They again
(a) Popular he certainly was; but he either had not fortitude and talents to execute his orr plans, or aned a bafe part to his amiable mafter. From bafenefs we acquit him.

ind ase 2:ソ10 refuted. penc, and to proced in a bedy to l'aris to encounter pertonaliy every danger that might occur. But they were coolly told, that the hing was the belt juige of the mosect enploying the troup, and that the prefence (f) the adtembly was necelfary at Verlailles. From a fuvereigu who dubtlef recellieted the proceedings of the long parliament of Eingland, a different reply could not in reation be expectad. On receiving it, however, it was inftantly decrecd, on the motion of the marquis de la Fiyette, that the late ministry had carrial cuith th.m the confidence of the alembly; that the troopsougly to be rmozer: that the minifty are and Ohall be refponfible to the people for their conduct; that the alfembly perlifed in all its former decrecs; and that as it had taken the public debt under the protection of the nation, no power in France was entiticd to pronounce the intimous word iantrantiy.

The city of Paris was thrown into deep conternation by the news of M. Neckar's retreat. His buit and that of the Duke d'Oile:nns were drefled in mourning, and carried through the Arects. The royal Allemand, a German regiment, broke in pieces the bufts, and difperfed the populace. I'le prince De Lambefq, grand ecujer of Framce, was ordered to adrance with his regiment of cavalry, and take port at the Thuillemes. Leing a man of a violent temper, and enraged by the appearances of difapprob:ttion which were vilible around him, he lurioufly cut down with his firord a foor old man who was walking peaceably in the gardens. The confequences of this at of inhumanity were fuch as might have been cxpected; a thout of execration inAtantly arofe; the cry to arms was heard ; the military were alfaulted on all fides; the French guards joined their countrynon, and compelled the Cermans, overpowered by numbers, and unfupported by the relt of the army, to retire.

All order was now at an end, and as night approached an univerfal terror diffufed itfelf through the cityDands of rabbers were collecting ; and from them or from the forign foldiery a general pill:ige was expected. 'lhe night palled away in confternation and tumult. It was found in the morning that the hofpital of St Lazare was already plundered The alarm bells were rung; the citizens allicmbled at the Hotel de Ville, and adopted a propofal that was there made, of entolling themfelves as a militia for general defence, under the appellation of the national suard. This day and the fucceeding night were fpent in tolerable quietnefs, withrut any attempt on the part of the army. On the morning of the memorable ith of July, it was difcovered that the troops encamped in the Champs Elifécs had moved off, and an imniediate affanlt was expected. The national guard now arnounted to $150,0 r 0 \mathrm{men}$; but they were in general deftitute of arms. 'Ihey hat alfumed a greencockade; but on recollesting that this was the livery of the Count d'Artois, they adopted one of red, Llue, and white. M. de la Salle was named commaniler in chief, nflicers were chofen, and detachments fent atound in quelt of armis. In the Hitel des Invalides upwards of 30,000 ftand ol arms were lound, along with 20 pieces of cannon; a variety of weapons was alfo procured from the gard. meuble de la courone, and from the fhops of amourers, cullers, \&c.

The celcbrated fortrefs of the Baltile was an pbje?
of much jealoufy to the Parifians. At 11 oclock in French the moming, M. de lat Rofiere, at the head of a nume- Revolution rous deputation, wated upon $\mathbf{M}$. de Latmay the go- $\underbrace{178 \%}$ vernor, who primiled, along with the nthicers of his garrifon, that they would not fire upon the city unlefs the warthey thould be attacked. But a report was foon fpread veattackthrongh Pais, that M. de Launay had, in a thort time ${ }^{\text {ca }}$ therealter, adruitted into the fortrein a mulcitude of perfons, and then treacleeroufly malfacred them. The canfe of this piece of perlidy has nerer been explained. The fact inelf has been denied; but it was attefted at the time by the duke of Dorfet, the Britith ambaliador at the court of France. The effect of the report was, that a fudden refolution was adopted of afiaulting the Bafte; an immenfe and furous multitude rufhed in:o its outer, and fonn forced their way into its inner, courts, where they reccived and returned a feverc fire for the fpatce of an hour. The French guards, who were now embodied into the national guard, conducted the attack with tkill and coomets: they dragged three waggons loaded with ttraw to the foot of the walls, and there fet them on fire ; the tmoke of thefe broke the aim of the garifon, while it gave no ditturbance to the more ditant affalants. The befieging multitude preffel the attack with incredible obitinacy and vigour for the fpace of four hours; the ganiton was in confulion; the officers ferved the cannon in perfon, and fired their mukets in the ranks; the governor in de!pair, thrice attempted to blow up the fortrefs. A capitulation, when at laft fought, was refufed to the garrifon, and an unconditional iurrender took place. The governor, and M. de Lofme Salbrai his major, a gentleman of difinguifhed humanity and honour, became victims of popular fury in Spite of every effort that could be made for their protection; but the French guards fucceeded in procuring the fafety of the garrifon. Only feven prifoners were found in the Baftile. A guard was placed in it, and the keys were fent to the celebrated M. Briffot de Warville, who a few years before had inhabited one of its caverns.

The remaining part of this eventful day was fpent at Parisin a mixture of triumph and alarm. In the pocket of the Governor of the Baftile a letter was found, encouraging him to refillance by the promife of fpeed fuccours, written by M. de IFelfelles, the prevot de marchands, or chicl city magifrate, whohad pretended to be a molt zealous patriot. This piece of treachery was purithed by intant death; and his bloody head was carried through the city on a pole, allong with that of M . de Lamnay. At the approach of night 2 body of troops advanced rowards the city, at the Larrierc d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the firft fire: barricadoes were every where formed, the alarm-bells were rung, and a general illumination continued during the whole of this night of confulion.

In the mean time, it was obvious that the new minifly were entcring upon a dificult feene of action, niffy apwhere one falle fep might lead to ruin, and where pointed. their own phan of conduat ought to be maturely digentcd. Marlhal Broglio was made minifter of war, the baron de Bretenil prefident of finance, M. de lat Galeziere comptroller-general, M. de la Porte intendant of the war department, and M. Foulon intendant of the

## R E V 「 159 ] R E V

French navy ; but thefe were only meant to at as official men, Revolution under the Count d'Artois, and the other leaders of the 1789.

42
Their fituation difficult, and their conduct bad. ariftocracy. To thefe leaders there did not even remain a choice of difficulties; no refource was left but that of overawing by military power the national affembly and the eapital, and of rifking the defperate meafure of a national bankruptcy, which the court had not formerly dared to encounter, and to avoid which it had convo-
ked the ftates-general. No trace remains, however, of any attempt to put this criminal, but latt refource, in execution. The evening after the departure of M. Nechar was fpent by the court of Vertalles in fealting and joy, as if a victory had been gained. The courciers of both fexes went round among the foldiery, Atriving in fecure their fidelity by carelies, largefies, and every fpecies of fattering attention. The miniftry not only failed to fupport the Prince de Lambeiq in the poit which be had been fent to occupy, but they tuffered the whole of the 13 th to pais in indecition, while the capital was in a fate of rebellion, while an army was formally mutering within its walls, and the names of the principal nobility were put up in lifts of proferiptions. They received the news of the capture of the Batile with confufion and difmay, which were inereafed, if polfible, by information given by Marhal Broglio, that the troops refured to act againtt Paris or the national affembly. In this perplexisy they adopted the miferable device of concealing from the king the ftate of public affairs ; and that unfortunate prince was thus perhaps the only perfon out of millions around him who remained ignorant of the convulfious in which his country was involved.

At length, at midnight, the Duke de Liancourt forced his way into the king's apariment, and told him of the revolt of hi, capital, of his army, and of the furrender of the fortrefs of the Batile. The Count d'Artois, who was prefent, ftill attenupted to retain the monarch under his fatal delution ; but the Duke de Liancourt turning round, exclaimed, "As for you, Sir, your life can only be faved by infant flight; I have feen with horror your name in the lloody litt of the profcribed." Accordingly the Cuunt, with the members of his mort lived adninitration and their adherents, fled to the frontiers. And thus an emigration commenced, the fource of that terrible contelt which has covered Europe with bloodfhed and mourning. This miniftry had, $n 0$ doubt, many difficulties to contend againft ; but an aceurate attention to their conduct excites a fulpicion which, while it exculpates them from many intended crimes that have been laid to their charge, at the fame time does little honour to their t:1lents. It is this, that they bad come into offee without having formed any elear plan of conduet ; that they were men acting without decifion and at random, and confequently became the fport of th fe events which they wanted fkill and vigour to dirent or controul. By their introduction into office, and their mificonduct while in it, the royal authority fell prollrate before the popular party in the national affembly. The nobles and the clergy fill remained, but ecnfounded in one affembly with the more numerous order of the tiers etat; and no longer rallying round a throne that was too feeble to afford protection, they foon yislded to that fierce and levelling fpirit of democracy that now rofe around them.

But the perfon of the monarch was fill beloved. Early next norning the king went to the aftembly, but with none of the ufual folemnities. He "regretted the commotions of the capital, difavowed any knowledge of an intention againtt the perions of the deputies, and intimated that he had commanded the removal of the troops." A deep and expreffive filence prevailed for a few moments; this was fucceeded by vehement and univerfal fhouts of applaufe. The king arofe to depart, and inftantly the whole alfembly crouded around, and attended hin to his palace. The queen appeared at a balcony with the dauphin in her arms; the mufic played the pathetic air of Oit peut-on être micux qua au foin de fo famille. The entlunfarm of loyalty communicated itfelf to the furrounding multitudes, and nothing was heard but acelamations of joy.

On the following day, the king declared his refolution to vifit the city of Paris in perfon. Accordingly that prince, who never wanted perfonal courage, how-
ever deficient he might be in political ever deficient he might be in political ftedfaftnefs, fet out, attended by fome members of the aftembly and by the militia of Verrailles. He was met by the celebrated M. de la Fayette, at the head of a budy of the national guard, of which he had now been chofen commander in chief. M. Bailly, in whofe perfon the ancient office of mayor of Paris had been revived, received the king at the gates, and delwered to him the keys. All this while no fhout was heard from the crowd of innumerable fpectators but that of Five la mation. The king advanced to the Hotel de Tille, where the new cockiade was prefented to him, which he put on, and prefented himfelf with it at a window. At the fight of this badge of patriotifm an univerfal fhout of Vive le Roi burft forth from every quarter; and he returned to Verfailles amiult general triumph and ap-
planfe.

Much confufion ftill prevailed in the capital; but In which there was more appearance of regularity than could have in whin conbeen expected at the conclufion of fuch important fufion fill events. This arofe from a cafual coneurrence of cir. privailsd. cumfances. To condus with eafe the elections to the Atates-general, Parishad been divided into 60 diftricts, each of which had a feparate place of meeting. The people did not eleet the members to the ftates-general; but they chofe delegates, who, under the name of electors, voted for the members. At the commencement of the diturbances, the electors, at the requelt of their felluw-citizens, aftumed a temporaryauthority; of which, however, they were foon weary, and as foon as potib!e procured the public election of 120 perfons as municipal officers for the government of the city. The citizens having got the habit of affembling in their dittricts, grew fond of it : they afembled frequently, made rules tor their own government, and fent commillioners to communicate with ouher diftricts. The tumultuous nature of thefe meetings, and the vehemence of debate which prevailed in them, will belt be conceived from the ludicrons centrivance of onc of their prefidents, who ftationed a drummer at the back of his chair, and when the contufion and noife beeame altogether ungovernable, gave the fignal for beating the drum, whic! fpecdily overpowered every other nuife. Thefe meetings, however, gradually ripened into clubs, fin which much dexterity and intrigue were exerted.

The whole of the late minitry efcaped excepting M.
french Fouton. Ilis charater, it may well he imagined, was Revelutun extremely unpopular; fit he is faid to have alferted,

1 1.2.

bise of $1 \%$. feulin!, one of the lase ainifiry, alld his fon-in. law Berchier.
M. Nechar recurns and the imuiediatc contequences of it. that he would " m.l.e the perple ol loiris eat lay." He had retied to the conntry, but was feized by his - cwn valfals, and bronght to I'aris with a bmadle of hay tied to hishack. In fite of every efort made by M. M. 13ally and losuctec $^{2}$ to procure him a lair trial at leaft, he was carried to the Place de Giever, and hanged at a lamp-iron by the enraged mukitude. Ilis fon-in-law M. Berthier, atttempting io deferd hinueif againlt a limilar fate, fell, covered with wounds. Their heads were carricd round on po'es: and thus the poputace beeame habinated on the fight of blood and murder: they were even taughe by popular fongs to glory in fich actions, and particularly by the well known long Cistira.
In ennfequence ol an invitation from the king, M. Necha: returned to France. He was received by the allembly with great applaule, and in Pas with infinite fiolenmity and triumph. He here, lowever, committed a political error that made fome noife. In deploring the late excelfes and murders, and taking nutice of the arreft of M. Bezenval, an officer of the Swifs guards he requefted of the electors at the Ilotel de Ville, in afolemn harangue, that the patithould be for gotten; that proleriptions fhould ceate, and a general amnetty be proclaimed. In a moment of enthuliafm this w:is agreed to, and the electors decreed what unquefionably exceeded their powers. The ditriats of Faris were inlantly in commotion; the electors alarmed, declared that they only meant that " hencelorth the recple would penilh no man but according to law ;" and, at the fime time, to prove that they themfelves were free from ambition, they formally renounced all their own powers. The aficmbly took up the quefion. Meff. Lally, 'I'olendal, Mounier, Clermon:, 'lonnerre, Garat junior, and nthers, declared that no perfon ought to be irrefted without a formal acculation. While Meff. Mirabeau, Robelpierre, Barnave, and Gleizen, alleged, of the contrary, that the people were entitled to lay hold of any man who had public15 appeared at the head of their enemies. The debate ended, by admitting the explanation of the electors, and by a declarstion that it was the duty of the alfem-
bly to fee jultice exccuted in all cafes.

The commotions and enthufiafm of the capital were fpeedily communicated to the provinces. In every gtarter the people feized upon all the arms that could be found, and the military uniformly refufed to at againft them. Nany acts of outrage were committed in Brittany, at Strafoumrg, in the Lionnois, and clicwhare, in which the nobility were the fufferers. 'The mifchiefs that oceurred were ufually magnified at a diftance; but that very circumfance was an additiona! evil. For example: It was ©ated in the National Af. lembly that M. de Mefmay, lord of Quincy, invited a number of patriots, among whom were the officers of a neighbouring garrifon, to a fplendid entertainment at his houfe, to celebrate the happy union of the threc onders: That in the midat of the feat the matter of the house contrived to withdraw unnoticed, and to fet fire to a train previoufly laid, which communicated vith a quantity of gunpowder in the cellars, in conferpuence of which the whole company, by a fudden explolion, were blown into the air. It was found on inquiry;
that there was not one word of truth in the whole fory. French But before this inquiry conld be made, all France Revalutioa had sefounded with accounts of the pretended blondy tragedy: and the whole nobility of the kirgdom fultered in at lefo or greater degree, from the prejudices excited by this whappy report, the origin of which has never been well explained. It would be vain to flate all the idle rumours to which at this time the blind credulity of the multitude gave currency. At one time, the Arifocrats were cutting down the green corn, i.t another time they were burying flour in common fewers, or catting loaves into the Seins. One report was 110 fooner proved to be filie than another arole, and the whole nation was agitated by fufpicion and alarm. 'I'he National Aliembly were engaged in framing their cel:brated declaration of the rights of man, which was to form the balis of the new conltitation, when the alatming accounts, received from all quanters, of the Itate of anarchy into which the kingulom was tilling, obliged them fuddeniy to turn their attention to uhjeets of prastical necelfity. The privileged orders found themfelves become the objects of univertal jealouty and hatred ; and that fomething mull infantly be done to tave their families and property, which were menanced on every fide with perfecution and pillage. Regarding the pupular torrent as now become irreliftible, to fare fomething they refolved to facrifice a part.

On the afternoon titting of the 4 th of Augult, the Vifcount Vifcount de Noailles, feconded by the Duke d'Aiguil. de Noaille Inn, opened one of the molt important feencs in the French Revolution, or in the hiftory of any country. Thele noblemen fated, that the true caule of the com. motions which convalled the kingdom exilted in the mifery of the people, who groaned under the double oppreffion of public contributions and of feudal fervices. "For three months (faid M. de Noailles) the people have beheld us engaged in verbal difputes, while their own attention and their withes are directed only to things. What is the confequence ? They are armed to reclaim their rights, and they fee no profpect of obtaining them but by force." He therefore propofed to do jultice as the fhortelt way of reftoring tranquillity, and for that purpofe to decree, that henceforth every tax thould be impofed in proportion to the wealth of the contributors, and that no order of the fate fhould be exempted from the payment of public burdens; that feudal claims thould be redecmed at a fair valuation ; but that fuch claims as confifted of perfonal fervices on the part of the valfal hould be abolifhed without compenfation, as contrary to the imprefcriptible rights of man. 'I'he extenfive poffelions of the noblemen who made thefe propofals added much luftre to the difinterefted facrifice which they offered. Their fpeeches were received with the mof enthuliafic applatufes by the Affembly and the galleries, and their propofals were decreed by acclamation without a vate. No nation is fo much led by the influence of fudden emotions as the French. 'The patriotic contagion now fpread falt through every breaf, and a conteft of generofity enfued. The hereditary jurifdictions poffefled by the nobles within their own territories were next facrificed. All places and penfions granted by the Court were fuppreffed, unlefs granted as the reward of merit or of actual fervices. The rame laws, which condemued the The gamee lubindman, under fevere penalties, to leave his proper-aholified.

Yrench Revolution $178 y$.

52
Manyancient privileges are voluntarily furre: dered.
ty a prey to infinite multitudes of animals referved for paitime, had always been numbered among the fevere grievances of the French peafantry. Tlefe were therefore renounced, along with the exclufive rights of rab. bit watrens, fitheries, and dovecotes. The fale of cifi. ces was aboliihed, and the fees exated from the poor, together with the privilege of holding a plurality of livings, were relinquifhed by the clergy. T'he deputies of the Pais d'Etat, or privileged provinces, with the deputics of Dauphiné at their lead, next came forward, and offered a furrender of their ancient privileges, requelling that the kingdom might no longer remain parcelled out among D.uphinois, Bretons, Provençaux, sic. but that they fliould all form one great mafs of French citizens. They were followed by the reprefontatives of Paris, Manfilles, Lyons, Bourdeaux, Strabourg, \&c. who requelted leave to renounce all their feparate priviliges as incorporations, for the fake of placing every man and every village in the nation upon a footing of equality. Thus the Affembly procceded, till every momber had exhaulted his imagination upon the fubject of reform. To c.ofe the whole, the Duc de Liancourt propufed that a folemn $T_{e}$ Dium fhould be performed, that a medal thould be ftruck in commenoration of the events of that night; and that the title of Restorer of Gallic Liberty thould be beltowed upon the rcigning monarch. A deputation was accordingly appointed to wait upon the king, refpectfully to inform him r.f thefe decrees.
53 Several fucceeding days were necelfary to form into revenues of laws the decrees of the 4 th A uguf, and committees were the clergy appointed to make out reports for that purpofe. One of taken away.
thefe reports having included the titles and revenues of the clergy among the abufes that were to be done away, and having propofed in lieu of them to grant a certain ftipend to the different minilters of religion to be payable by the nation, the clergy attempted to make a ftand in defence of their property, and vinlent debates enfued. In thefe they were ably fuppored by the Abbe Sieyes: but as the clergy had formerly delerted the nobles, fo they were now in their turn aoandoned to their fate by the hereditary aiftocracy. The popular party had long regarded the wealth of the church as an eafy refource for fopplying the wants of the ftate. Never was there a more complete proof of the influence of opinion over the affairs of men. The Catholic clergy of France, though polleffed of more property than they enjoyed at the time when princes took up arms or laid them down at their command, now found fo few defenders, that they were terrified into a voluntary furrender of all that they and their predeceffors had polfelfed for ages. In their oveithrow, they farcely eajoyed even the barren honour of having fallen the laf of thote privileged orders that to long had ruled over this ancient kinedom. They and the nobles, and the king, fill poffeffed their former tities and nominal dignity; but all of them were now fubdued, and at the mercy of the commins of Fiance, uho fpeedily difmilted them at their pleafure.

As a fhort featon of tranquillity in the Court and the National Alfembly fucceeded theie great popular facrifices, the king laid hold of it as a fii opportunity for the appointment of a new miniftry. Thes confinted of the Archbithop of Vienne, the Archbillop of Bourdeaux, M. Neckar, the Count de Si Prieft, Count de

Vol. XVI.

Montmorin, the Count de la Luzerne, and the Count de la Tour du Pin Paulin. M. Neckar, as minitter of finance, having Itated the diftreffed fituation of the revenue, prefented the plan of a loan of thirty millions of livres. Bu: M. Mirabean, from a fpirit of rivalhip, as it would feem, to M. Neckar, prevailed with the Affembly to alter and to narrow the conditions of it in fuch a degrce that vory few fubfribers were found, and the loan could not be filled up. This failure involved the Allembly in a confiderable degree of unpopularity ; in confequence of which they allowed M. Neckar to preforibe his own terms for the purpofe of obtaining a loan of eighty millions. But the happy inftant of public confidence had been allowed to pals away, and this loan was never more than half filled up. Recourfe was next had to patriotic contributions ; and great numbers of gold ings, filver buckles, and pieres of plate, were prefented to the Affembly. The Royal famiiy them. felves fent their plate to the mint, either to give countenance to thefe donations, or, as M. Neckar has fince afferted, through abfolute neceflity, for the purpofe of fupporting themfelves and their family. The confufion into which the nation had been thrown by the late events had produced a fufpenfion of the payment of all taxes. There exifted, in fact, no efficient government ; and if fociety efaped entire difiolution, it was mercly in confequence of thofe habits of order which are produced by a tate of long continued civilization. The bufinefs of government could not be tranfacted withont money, and many vain efforts were made by the miniAry to procure it. At length M. Neckar was driven to the defperate refource of propofing a comprifory loar. or that every individual poffelfed of property fhould advance to the flate a fum equal to one-fourth of his annual income. This bold propofition was fupported by Mirabeau, and adopted by the Affembly; but it does not appear to have ever been effectually executed.

In the mean time, the A(fembly was bufily occupied nifcufions in framing the celebrated declaration of the Rights of on the MIan, which was afterwards prefired to the new confti- Rights of tution. This was followed by the difcuftion of a point Mau, of much delicacy and difficulty; viz. What fhare of legiflative authority the king ought to poffels under the new conftitution; whether an abfolute negative or vets, a fufpenfive velo, or no zeto at all? This queftion operated like a touchlone for trying the fentiments of every perfon; and the affembly, confifting of 1200 men , was now fecn to arrange itfelf into two violent contending factions. The debates were vehement and tumul. tuous, and continued for many days. As the affembly fat in public, and as multitudes of people of all defcriptions were admitted into the galleries, and even into the bndy of the hall among the mambers, many inde. cent fcenes took place in confequence of the interference of the fpeftators to applaud or cenfure the fentiments which were delivered. Thus the public at large becime fpecdily interefted in the difcufion; the city of Paris took a fide in oppofition the two, and the whole empire was thrown into agitation by new and fpeculative quellions. The diltinguithed place which France holds among the nations of Europe rendered thefe fingular events and difufinns the object of univerf.t attention. The contagious love of noveley fpread rapidly abroad, and gave rife to that watchful jealoufy on the part of the monarchs of Europe, which

X
irerdh was fpeedily to burll forth in a bloody tempent. - In Revolution the prefent cafe, the people of l'aris became molt eager$1 ; 8 \%$. ly interefted. Rumours of plots were fipread through the country, and a new form was obviunlly gathering, when the queltion was thus get quit of. M. Mounier remarken, that the executive power could polfers no negative afaint the decrees of the prefent aflembly, which had been nominated by the nation with fupreme powers for the exprefs purpofe of framing a conltitution, which was to remmin binding orer all ordess of men in the flate ; and with regard to future legillatures, the king declared by a meflage, that he wifled to pollefs no more than a jufpenfice veto. It is remark:able that the popular Mir.beaus concluded a fpeech in favour of the abiolute seto of the crown with thefe words, "That it would be better to live in Conftantinople than in France, if laws could be made without the royal fandion." This political adventurer is, however, acculed of having taken care to circulate in Paris a report that he had oppofed the veto with all his infuc:ace ; and to give credir to the flory, he is tuid to have quitted the alfembly juft before the divifion, that his vote might not appear on record againit it.

In the debates about the veto the month of Augult
was fent ; and in the beginning of September a new conflitutional queftion was prefented to the affembly by one of its numerous committees. This was, whether the legiflative budy ought to confift of one or of two chambers? Mounier, Lally, Tollendal, Cleımont Tomerse and others, who were zealous lovers of freedom upon what were then accounted moderate principles, fupported eagerly the idea of eftablibhing two independent chambers in imitation of the Britifh conftitution; but they were deferted both by the demovratic and arifocratic parties. The firf of thefe regarded an upper houfe or fenate as a refuge for the Id ariftocracy, or as the cradle of a new one; while the higher nobles and clergy feared left fuch an arrangement might prevent the future re-eltablifhment of the ancient divition into three orders. Of 1000 members who voted, only 89 fupported the propofal for dividing the legrilature into two chambers.

Swon after this, the king gave his fanction to the impartant decrees of the $t^{\text {th }}$ of Augult, but not without fome h.clitation, and expreffing doubts of the wif. dom of fume of them in a letter to the alfiembly. At the fame time the inviolaliaty of the perfon of the monarch was decrect, the indivilibility of the throne, and its hereditary defeent from male to male in the reign. ing family.-1jut we flatl not here attempt to enter into a detail of the vari us anticles of the new conftitution as connefted $v$ ith the circumftances under which they became the fulject of dubate. We flall only fate thofe more remarkable cincumftances which tend to af eurtain the peculiar changes which the fentiments of the nation undervent in the progrefs of a revolution the moft remarkatle that occurs in human hiftory.

In confeguence of the debates upon the queftions of the veto and the two chambers, the minds of partics had become much irritated. Patis wore the fane threatening afpect that it had done in the mouths of June and of July preceding; and every thing feemed tencing towards an important crifis. 'The ariftecratic party accufed their antagonills of a defign to excite new infurrections; and the charge was retorted, by cir-
culating a report that a plot for conveying the king to Metz was already ripe for execution.
From the period of the defection of the French guards, who were now in the pay of the capital, the protection of the royal family had been entrufted to the militia or national guards of Verfailles, together with the regiment of the gardes doc corps, which was compofed entirely of gentlemen. Upon the circulation of the report of the intended fight of the king, the French guards began to wilh to be reflored to their ancient employment of attending his perfon, for the purpofe of preventing any attempt of this nature. Thais idea was cagerly cherithed by the capital; and, in ficte of every eftort ufed by M. de la Fayette, the obvions appearance of approaching difurbances culd not be prevented. The popular party faw the advantages which they would derive fiom placing the affombly and the king in the midt of that turbulent metropolis which had given birth to the revolution, and upon the attachment of which they could molt fecurely depend. Every encouragement was therefore given by the moft active leaders of what was now called the Democratic party to the project of eftablifhing the court at Paris. The miniftry were under no fmall degree of alarm ; and the count d'Eftaing, who commanded the national guard of Verfalles, requefted the aid of an additional regiment. The regiment of Flanders was accordingly fent for: its arrival caufed no fmall degree of amiety; and every effort was inftantly made to gain over both officers and foldiers to the popular caufe.

On the firlt of Otober the garde du corps, probably for the purpofe of ingratiating themfelves with the newly arrived regiment, and perhaps to attach them more fteadily to the royal caufe, invited the officers of the regiment of Flanders to a public entertainment. Several officers of the national guard, and others of the military, were invited. The entertainment was given in the opera houfe adjoining to the palace; feveral loyal toafts were drank: but it is afferted, that when the f.avourite popular toalt The Nation was given, it was rejected by the gardes du corps. In ordinary cafes, fuch a trifing circumllance as thas, or even any other of the tranfactions of a night of fenivity, would juftly be regarded as unuorthy of notice in recording the more remarkable events in the hiftory of a great nation; but fuch was now the fingular fate of aftairs, that the moft trivial oscurrences were inftrumenta!, by their combination, in the production of important confequences. The queen, laving leen from a window of the palace the gaiety which prevaled among the military, prevailed "ith the king, who was jult returned from hunting, to vifit them along with herfelf and the dauphin. Their fudden appearance in the faluon kindicd in an inflant the aucient enthutiafm of French loyalty. The grenadiers of the regiment of Fl anders, along with the Swifs chaffeurs, had been admitted to the delert; and they, as well as their nflicers, drank the health of the King, Queen, and Dauphin, with their fiwords drawn. The rosal famly having biwed with politenefs to the company, setired.-Of all mations, the French are molt liable to the iafluence of fudden impreflions: the mufic played the faveurite air, o Ricard! 0 mon Roi! l'univers f'alandonne, "O Ri=hard! O my king! the world abandons thee." In the cagenefs of
hoyalty,

## REV [ 163 [ E V

French loyalty, the national cockade, which had been adoptRevolution ed by fome of the gardes du corps, wa, thrown 1789. afide, and white cockades were fupplied as quickly as thes could be made by the ladies of the court.

When thete events were next day reporied at Paris, accompamed by a multitude of exaggerdions, they gave rite to the moft vioient alarm. The capital was at that time suliering all the horrors of famine; and in fuch a fituation, the news of a fealt which others have enjoycd, feldom gives much pleafure to hun ${ }_{j}$ ry men. To the former report of an intended flight on the part of the royal family, it was nuw added, that a counter revolution was ipuedily to be attempted by iorce of arms; and that the prefent fcarcity was artificially created by the court for the purpofe of reducing the people to fubniffion. Their arifocratic antagonits have fince afferted, that the famine was indeed artificial ; but that it was created by a portion of the violent party in the national alfembly, which was then denminated the Calal, whofe object was to excite commotions as the means of procuring an opportunity of fetting the duke of Orleans at the head of the itate, either as regent, or in fome other form. To this laft jarty Mirabeau is fa:d to have belonged.

For four days no notice was taken in the affembly of what had palfed at the entertainment given by the gardes du corps. On the 5 th of Ofnber M. Petion mentioned it for the firit time, and a violent debate enfued; during which Mirabeau rofe and exclaimed, "Declare that the king's perfon alone is facred, and I myielf will bring forward an impeachment;" thereby alluding to the conduct of the queen. While this debate was pro- motion. A valt multitude of women of the loweft rank, with fome men in women's clothes, had affembled at the Hored de Ville, and were calling aloud for arms and bread. They refolved to proceed inltantly to Verfailles to demand bread from the kiug and from the national allembly: La Fayette oppofed them in vain; f.r his own foldiers refuled to turn their bayonets againit the women. Upon this one Staniflaus Maillard, who had ditinguifhed himfelf at the taking of the Baftile, offered himfelf as a leader to the infurgents. He had the addrefs to prevail with them to lay aftide fuch arms as they had procured; and he fet out for Verfailles about noon with as much order among his followers as could well be expected from fuch an alfemblage. Either becanfe the paffion for going to Verfailies liad fuddenly become too infectious to be refifted, or becaufe the multitude already gone thither was now accomted dangerous, the mayor and municipality of Pabis thought fit to give orders to La Fayette inftantly to fet out for that place at the head of the national guard.

In the mean time, Maillard approached Verfailles with his tumultuous troop; he arranged them in three divifions, and perfuaded them to behave with tolerable decency. The king was hunting in the woods of Mendon when he was informod of the arrival of a moft formidable band of women calling aloud for bread.
63 "Alas! (replied he) if I had it, I Hould not wait to And fend be atked." Maillard entered the affembly accompaa deputasion to the affenhl?.
lay their complaints before the king. His mijelty recei- French ved the whole with great politenef, and readily agreed Revolution to go mo any meafures for the fupply of the capital ${ }^{x-8 y}$. that could be fuggefed. The report of this behaviour had fech an effect upon the multitude collected around the palace, th th they began to difperie; but they were fpeedily fucceeded by another crowd not lefs numerous. A fudjen refolution of flight feems now to have been propoled by the court; for the king's carriages were brought to the gate of the palace which communicates with the Orangery : but the national guard of Verlailles refifed to allow them to pais, and the king himfelf refule 1 to remove, or to allow any blood to be fied in his caufe.
La Fayette with his army at length arrived about La Faycte ron'clock at night, and found the afrembly in a very unplealant fituation. Their hall and galleries were crowded by the Parifian filh-women and others of the mob, who, at every inftant, interrupted the debates. La Fayette waited upon the king, and informed him of the proceedings of the day, planted guards in every quarter; and after a fcanty banquer had been procured for the multitude, he prevailed with the affembly to clofe their fitting for the night. In this laft part of his conduct M. la Fayette has been much cenfured, and probably not without reafon; for it could icarcely be expected that fuch a night would be fpent in peace by the immenfe affemblage of turbulent characters that were now brought together. All was quic', however, till about fix in the morning of the 6 th, when a great number of women and defperate perfons rufhcd forward to the palace, and attempted to force their way into it. Two of the gardes da corps were killed; the crowd afcended the flair.cafe leading to the queen's apartment, but were bravely refifted by M. Miemandre a fentinel, who gave the alarm, and defended his poft till he fell covered with wounds, of which, however, he afterwards fortunately recovered. The ruffians, reeking with his blood, rufhed into the chamber of the queen, and pierced with bayonets and poinards the bed whence this perfecuted woman had but jult time to fly almoft naked, and, through ways unknown to the murderers, had efcaped to feek refuge at the feet of the king, who was already aiarmed, and had gone to feek her.

The tumult became more violent every moment, and fudden death feemed to threaten the royal family; but La Fayette was by this time at the head of his troops, whom he befeeched eapnetly to fave the gardes du corps from malfacre. In this he was fuccefstul ; fome that had been taken prifoners were furrounded by the grenadiers of the French guards who proteted them, and the retreat of the whole corps was eafily fecured, The crowd was fpeedily driven from the different quarters of the palace, which they were already beginning to pillage ; and the royal family ventured to how thenfelves at a balcony. A few voices now exclaimed. Le Roi is Par's, "the King to Paris." The fhout became general; and the king, after confulting with La Fayette, declarect that he had no objection t., take up lis refidence at Paris, provided he was accompanied by the quesn and his children. When the propoful was reported to the affembly, the popular leaders expreffed much fatisfaction. They ordered a deputation of 100 members to attend the king thither; they voted the national affembly infeparable from the king. His majelly

Fresch fes out at two oclock aprifiner in the cultody of the Ravolation mob. "lwo gentlemen were leleted from his body 198). guard, and, with all the parate of an execution, be-

67 Are carsued prifo. ners so l's ris. headed in the court of his palace. Their heads were nack upon fecare, and ted the procellion; whilat the rayal captives who followed in the train, and beheld this ipuetacle, were condusted io fiowly, that a thert joarnoy of twelve rriles was poorraded to tix hours. the king, the queen, and their chiddren, were lodged in the old palace of the Lonre, while Menfeur went t) refide at the Luxernburg. The city was illuminatet, and the evening fent in trumph by the Parifinas.

The removal of the king to l'aris was regarded as a triumph by the popular party. The higher order ot nobles comflered it as completely raianos to their hopes; and even many men of tadere, fich ats M ourior and Laily Tolienfal, whom we cann-t avoid regarding as friends th the populat caule in its out-fet, now regarded every profpert of attaining a happy confitution. al free.lorn as at an end, :ts the mtion.al reprefeatatives mutt be for ever expofidt , the infults, and overawed by the irH:ence, of a turbulent capital. Many memhers of the arfenbly took refuge in forcign countries, and wed every effert to excite the other nations of Eurnp: to hantility again? France. As the duke of Orleans had been regarded as a chief agent in promoting the late diturbances, the marquis de l.a Fayette waited upon him, and inlifted upon his leaving the king dom fo: a time. The duke was overawed, and, on pretence of pablic bulinefs, went to England, where he remained for feveral mon:hs.

On the igth of Oatober, the National Allembly held its firf feffim in Patis. The King was claty gu.rsded in his own palace ; and no apparent oppofition now fond in the way to picvent the popular party from giving to their cuuntry fich a conflitution as they might julfe expedient. Nuch, however, was yet to be done, and many difficulties remained, refulting from the habits of men educated under a very different order of rhings. Two days after the Affembly came to Paris, a baker was publicly executed by the mob, upon a falie accufation of having concealed a quantity of brea. I.While the Afembly was at a diftance, events of this tature had been little attended to, and the leading party asonded attempting to clreck thefe ebullitions of popular violence, from which they had derived fo much advantage ; but that party was now all.powerful, and fo flagrant an ofience committed againt the haw was regardca ats an infult upon the fovereignty of the National Alicmbly. Two leaders of the mob were therefire tricid and publicly executed, and a fevere law was parf fed, of the nature of the bitith rict ad, anthorifing the magiftrates to aft by military force againit any mulsitude of perfons that thould relufe to difperfe. Thus the pace of the capital was fecured for feveial months; but in the crumry at large no tmall degree of anxisty and trouble fit! fintritled. The fame fuppicions temper which had prevailed at learis agitated the proviaces with the dread of plots and monopolies of grain. Add in) this, that the noblelle in the country were by no means fatistied with the liberality with which their rexeprefentatives had on the $4^{\text {th }}$ of Auguff voted away their privileges and their property. This produced violent jealoulics between the peafunts and their lords
and gradually conveyed to every corner of the kingdom the political ferment which had commenced at Pa is.

The National Allembly being now, however, in tolerable fecurity, proceeded in the arlu us attemp of forming a tree conflitution for the great empire of France. The Abbé Sicyes prefented a plan for dividing the kingdom into 83 deparments, of abrut 342 fquare leagues, and of each department into feveral ciffriats, and euch diftriet was jublivided into cantons of four fquare leagues in extent. Thus the whole of the ancient divigons of the kingdom into governments, generalities, and bailiewicks, was in an infant obliterated. An attempt was alfo made to fimplify in an equal degree the relative fituation of individuals in civil life, by a decree which put an end to all diltinction of orders and immunitics, fo far as any privilege whtever wis concerned. At the lime time, a bold and moft important meatine was adopted, which has fince proved the orga, of thofe terrible efforts which France has been enabled to make againtt the rell of Europe. 'This was the confifcation of the whole of the lands belonging to the church, for the purpore of fupplying the exigencies of the fate. In this tranaction, all regard to juftece was thown afide. The lands of the church were as cettanly the property of the then $p$ felfiors of thens as any eftate among us is the propeaty of him who cccupies it. The fate may have had a rizht to appopriate to itfelf the church lands upon the death of the incumbents; but it might with equal juftice, and perhaps greater propricty, have feized the en rmous revenues of the Dake of Orieans, as have confifeated a ling'e acre belonging to the molt ufelefs abbot withrut ilis own con'ent. This hold meature was propofed by the bithop of Autun, M. Talleyrand Perigord, a man who had been promoted to the bench in a molt irregular manner to ferve this very purpofe. The node in which this property wis to be expended was by iffuing affignments (affignats) upon it; wh ch affignments were to be received by the fate for the payment of taxes, or for the purchafe of church lands when fet up to fale. A provition was at the fime time made for the national clergy, who were for the future to be paid by the frate. On the day following that on which this imp rtant meafure was adopted, a decree was pafied, fuFpending the parliaments of the king dem frem the exercife of their functions.

Decrees, in which the interefts of io vaft a multitode of individuals were involved, could not be carried into effeet without much murmuring and oppoiticn. The parliaments, in particular, began to exelt themfelves with vigour, and, by protefts and other publications, attempred to inwalidate the decrees of the Affembly as illegal; but thefe provileged bodies, who had citen been accuftemed to contend with fome fiecefs agrainf the defpotic adminitration of their country, and on that account lad been for ages the objects of public applaue, now found themfelves unterly foriaken, and unable to refitt the mandate of a popular Ailemby. After a few fruitiefs truggles, they were all of them under the riceelity of fubmitting to their fate.

Nothing remarkable now occurred for fome time.- MunisipaThe alfently proceeded to org.nize the kingdom by the eftablilhment of monicipatities, and by reforming the jutifprudence of the courtry. It is to be cberved, however, that when the parlianment of Paris was abolifhed,

French lifhed, the Chatelet, being the fecond court in tha Revolution city, was retained for the purpofe of trying thofe per. fons who had become moft obnoxi.us by their attachment to the rojal caufe. This court had the fpirit to acquit the Baron de Bezenval, Marthal Broglio, and the Prince de Lambeiq. But having incursed much popular odium on this account, they were guilty of the unworthy meannefs of condeming to death the Marquis de Favres, for a pretended confpiracy (of which no tolerable proof was ever brought) to malface La Fayette, Eailly, and Neckar, and to convey the King to Peronne.

During the whole of this winter the King had been very Atrictly watched by numerous gnards placed around his palace, infomuch that the other nations of Europe confidered him as in a fate of captivity. To do away this impreflion, if poflable, and to make their king appear a voluntary agent in the meafures that had lately heen adopted, was now regarded as a mateer of fome importance. Every effort was therefore made to prevail with him to come to the Alfembly fuddenly, and, as it were, of his own voluntary motion, there to declare his adherence to the meafures which had lately been adopted. For fome time he refifted this propofal; but at length, on the 4 th of February, he did fuddenly appear in the National Afembly, where he complained of the attempts that had been made to thate the new conflitution. He declared his will "that it fhould be univerfally known that the monarch and the reprefentatives of the nation were united, and their withes were the fame; that he would defend the conllitutional liberty of the fate; that, in conjunction with the Queen, he would early form the fentiments of his fon for that new order of things which the circumit mces of the empire had in roduced." This decliration difpirited the arifocratic party in no fmall degree, and increafed that unhappy tendency of looking for aid from foreign countries which they had always been too apt to indulge.

On the isth of February, monafic entiblifhments were fupprefled, and their lands confifcuted; but the prefent friars and nuns were allowed penfions for their fubfiftence, and to continue the obfervance of their monaftic vows, if they thought fit. We may obferve here, that, in confequence of the evacuation of the monalteries, it is prohable that about this time the Breton cummittee began to alfume the appellat:un of the facolin Club, from the hall belonging to the Jicobin friars at Paris, in which their meetings were now held.

An event occurred at this time which tended in no fmall degree to increafe rhe odium under which the old government already laboured. This was the publication of the Red Book, or lift of penfuons and donations granted by the crown. In confequence of the moft prefing iuftances, it hid been communicated by M. Neckar to a committee of the Affembly, after many inticaties, and the moft folemn promifes of fecrecy. It afforded, however, too ftriking an advantage to the popilar party not to be made ufe of, and in a few days M. Neckar, to his no fmall furprife, faw this regiller publicly fold by every bookfeller in Paris. He ought not, indced, to have heen furprifed; and the giving up of this lift is ore of the many proofs which the tranfections of that period afford of his great unfitnefs for the office which he beid. With much indignation, however, he de-
manded why the committee had publifhed it without fronch the permifion of the Affembly or the King? But he Revolution was told by the committee, that "as to the Affembly, ${ }^{1790}$ they were fure of its approbation; and as to the King, ${ }^{76}$ they were not his reprefentatives." To give an idea of Effect of the effeet of this publication, it is only neceffary to remark, that, under the fhort adminitration of M. Calonne, the two brothers of the King had received from the puhlic treafury, independent of their legitimate income, nearly two millions fterling, and that L. 600,000 had been granted to an individual, becaufe he was the hußand of Madame de Polignac. M. Neckar's oppofition to this publication tended in no fmall degree to injure his popularity, and the reft of the miniftry began to lofe the confidence of the public. Indeed, at this time, fertile cauies of alarm prevailed on all fides. The clergy were attempting to revive in the provinces the ancient animofities between the Roman Catholics and the Proteltan:s, afcribing the late decrecs of the Affembly to the intter. The German princes who poffeffed property in the north of France were complaining loudly of the violation of their rights by the abolition of the feudal fyftem, although the National Affembly had voted to them a compenfation. The molt melancholy intelligence was received from their colonies in the Weft Indies. In regulating thefe, the Affembly had unt recognized the right of the free Negroes to enjoy the fame privileges with other citizens; at the fame time, they did not go the length of denying thefe privileges. This uncertain conduat produced infinite calamities. The whites contended with thofe commonly called poople of colour. Theie again fometimes food in oppofition to the free necgroes, or to the flaves; and hence it fometimes happened that no lefs than three hoAtile aflemblies were held at the fame tine in the fame colony, which made war upon each other with the moft inveterate fury. Each party found protectors in the National Alfembly of the parent fate. Thofe who fayoured or oppoied the exiftence of diftinctions at home, in general followed out the fame princ ple with regard to the colonies.
On the $14^{\text {th }}$ of May, M. de Montmorency commur- Debace ne nicated in the National Af?embly the preparations for the royal war in which England and Spain were engaged. This power to brought forward the conftitutional queftion, "Who ought to palfefs the power of declaring peace and war ?", The Crunt Clermont Tonnerre, Mefirs de Serent, Virieu, and Dupont, fupported the royal prerogative; while on the other fide, the exclufive right of the legillative body to exercife this important prerogative was fupported by Meflrs d'Aisuillon, Garat jun. Fretean, Jellot, Charles Lameth, Sillery, Petion, Roberpierre, \&c. M. Petion propofed a decree "that the French nation renounced for ever all idea of conqueft, and confined itfelf entirely to defentive war :" which was pafied with univerfal acclamation. The Count de Mirabean at length fuccefffully propofed that peace and war flowid be declared by the king and the legilhtave body in conjunction; and the decree that was palfed on the fubject is a ftrange farrago of contradictions and abfurdities. It enjoined the King to "guard the flate from external attacks." But how conld this he sone, withont repelling any attack tha: might be made upon it? This, however, he could not do, withont previonly informing the National Affemhly : and if that body chanced
its publicz. tien.

French manded loudly the regimental accounts. They feized Revolution at the fame time the military cheft, and fent a deputa1790. tion to fate their cafe at Paris to the national alfembly. But the officers were before hand, and prepofiefled the minifter of war againft them ; upon whofe reprefentation a decree was palfed, authorifing the commander in chief of the province, M. Boaillé, to reduce the infurgents by force. This was no fooner known, than the national guard of Nancy affembled, and fent a deputation to give a fair ftatement of facts. But Bouillć, without waiting the refult of an explanation, haftened to Nancy at the head of all the troops he could fuddenly collect; and having fallen upon the regiments of Chateauvieux and Mettre de Camp, after putting an immenfe multitude to the fword, he took 400 prifoners.

The King's regiment was prevented from acting againtt Buuillé by the intrepidity of a young officer of the name of $D$ iffilles, who, however, died of the wounds which he received on the occafion. The news of thefe events filled Paris with indignation. The affembly afterwards reverfed its own decrees againी the infurgents at Nancy. Public honours were decreed to the memory of Deffiles; but Bouillé could not be punifhed,

84

## M. Neckar

 refigne M. Neckar's popularity had been gradually declileaves the kingdom without being regretted. ming, as he was unwilling to go all the lengths that the ruling party wifhed. He gave in his relignation on the $4^{\text {th }}$ of September, and fpeedily thereafter left the kingdom. He was regretted by no party. He was regarded, on the one fide, as having conducted the kingdom to its ruin, by the conceffions which he originally advifed the king to make in favour of the fiers etat; while he was defpifed by the oppofite party as a lukewarm politician, of narrow views, and a feeble mind. He departed, however, with the unblemifhed reputation of frict integrity. M. Neckar docs not feem to have penetrated deeply into the characters of men, or to have had any conception of the effects of that terrible and reflefs encrgy which is called forth in a nation which attempts to make important changes in its ancient manners and government. Having no conception of the important era which was about to open upon that country of which he was the miniter, he was far from being qualified to direat or controul it amidat the convalfions which it was defliued to encounter. Unable to brook the lifs of his popnlarity, he peevifly retired to Swifferland, where he publifhed a work, which flows to the convistion of every unprejudiced reader the integrity of the French king, and the wicked projects of the le:ading democrates, whom85

Davy. he himfelf had armed with power.

The remaining part of th is year was occupied in attempts to introduce fome degree of fubordination into the navy of France, which had been much diforganized, and in farther regulating the affairs of the clergy. It - was now declared, that fuch clergymen as fhould not take the following oath, which had been prefcribed fome months before, thculd be confidered as cjected from their benefices: "'to watch carefully over the faithful in the parifh or diocefe which was entrufted to his care; to be faithful to the nation, the lav, and the king ; and to maintain to the utmott of his power the new confitution of France, and particularly the decrees zelative to the civil conblitution of the clergy." This
decree rendered the fituation of confcientions men extremely perplexing; efpecially as the pope teltified in marked terms his difapprobation of the oath. The people were reduced to the dilemma of choofing between their new political and their old religious prejudices; and the refult was extremely unfavourable to the intereft of religion.
1795.
86

The aftembly commenced the new year with a decree, Holtile apannouncing the termination of its feflion, which was to pearances take place as foon as it fhould have finifhed the difcuf- ${ }^{\text {in Gany }}$, \&e fion of a lift of conftitutional articles. In the mean time, on the fide of Germany, Spain, Italy, and Savoy, holtile appearances began to be exhibited, and bodies of troops advanced around the French frontier. The Emperor Leopold was, however, too cautious to announce his intentions; and the King foon communicated a letter from him, containing proteftations of amicable difpofitions, but adding, that "the innovations occafioned by the decrees of the 4 th of Augult ought to be done away." The king treated this merely as an official meafure on the part of the Emperor, that he might not appear to renounce the claims of certain German princes conneted with Lorraine and Alface. But the aflembly expreffed fome alarm, and voted an augmentation of the national force. About this period feveral new efforts were made by the difaffected clergy in various parts of the kingdom to excite difurbances, which it is unneceffary to mention in detail. On the 20 th of February the public attention was roufed by a circumflance that in any other fate of affairs would have been accnunted unimportant. The King announced to from the affembly, that his aunts, the daughters of Louis XV. Paris. had that morning left Paris; but as he did not apprehend that the exifing laws laid them under any refraint in this refpect, he had not oppofed their departure. After fome debate, the affembly agreed that the King had judged well; and thefe princeffes were left to purfue their journey to Rome, which they reached after fome delays occafioned by the jealoufy of certain municipalities through which they paffed. Thus the kingdom was gradually deferted by every branch of the royal family, excepting the King and his eldeft brother Monfieur. The alfembly, however, continued its 1abours with confiderable quietnefs. In the end of the month of March died the celebrated M. de Mirabeau, at the age of 42 years; a man whofe integrity has for many good reafons been much fufpected, but whole political addrefs and intrepidity, and whofe fplendid powers of eloquence, have been feldom equalled. He received from his countrymen at his death marks of refpect unparalleled in modern hiftory. During his fhort illnefs, his door was befieged by anxious citizens. A monrning of eight days was decreed by the affembly, and alfo a grand proceflion, which was attended by all the public functionaries. He was the firf who was interied in the new magnificent Pantheon, confecrated to the reception of the remains of illutrious men. But his afles were afterwards temoved, in confequence of very clear proofs that he had not been incorruotible by moncy.
During the whole of this fpring, much fear was en. An emitertained that fome attempts at a counter revolution grantarmy were about io be made. The emigrant arny affembled fembled on the burders of Alface was reviewed by the priched on the burders of Alface was reviewed by the prince $n^{\prime}$ berders o Condé. Their uniform was black, faced with ycllow, Afface,

Iren in W...i a death's l.cad, furrounded by a lutel wreath on Q:v. lutwan one ctit, and a fivord on the othicr ; with the motte, 10.91. " Congre: or die." "The king was allo fummended by crow is if romaring priefts and wher difintileted per:ons. T. us, that prular jealoufy which in every pe-
90 fode of the revolation has trihingly marked the French peasous of thanacer, washeft on the allarm. O. the 18th of A. tie po ple pril, therefure, when t. e royal fimily was preparing to nol mine tary les the kir?
 minfould feople. Larr Fayeste drew ont the national guald by eaigrase. they refutid to no. "WYe know (exclaimed abey) That we are viluting the laws, but the falcty of our country is the nithe". The king inflantly went to the arlembly, and with nuth pinit complained of the intult. Ite was antwered refpestfully by the prefident, and erntinued his journey. As the royal family had enjoyed a confiderable degree of freedom for fome time path, which wat demonfrated by the mefucceisful opbition made to thin jouney-the prefent opportunity was erabraced for intimation to foreegn conts his acceptance of the conflitution; and all obnoxious perfons wire difmiffed from about his perfon. The breach of citcipline or the part of the rational guard on this occation was fo much refented by La Fayette, that he refigned his command. Paris was thrown into confternation; and it was not till after the molt univerfal folicitation that he was prevailed upen to refume his

About this time M. de Bouille, to whom the protection of the trontiers was entrulted, was employing, as it is row faid, every means in his power to render the couniry detenceleis. The garrifuns were left unprovided ; dillunion was fpread among the national troops; they were removed from the frontiers, and their place was occupied by foreigners, wherever it could he cone. The emigranis abroad, and their friends at home, were 1ying in wait for an opportenity of revolt; -when fudderly, on the 2 ift of June, it was arnounced from the Thuilleries, that the king, the queen, the dauphin, with monieur and madame, had quitted the palace and the capi:al, without leasing any information of their intention or their route. The emotion excited by this news among the mul itude was a mixiure of conflernation and rage. The national afembly, however, acted with much coolnefs. They inflantly took upon themfelve the government, and decreed their fittings permanent. They fent meffengers, at the fame time, in ala! directions, to attecnupt to lay hel11 of the fugitives. Thefe had taken different routs. Monlieur and madame arrived fufcly at Brufels on the 23d. The king, queen, and their chldren, when they came to a confiderible diftance from the capital, were furnithed by 13 uillé with a graard of dragoons, under pretence of protcaing treature for the pay of the troops. At the difance of 156 miles, and when only a few leagu's frem the frontiers, they were arrelled at St Menehould by the pormather, M. Drowet, forme ly a dragoon in the regiment of Condé. At ha'f patt feven o'clock in the evening the carringe, Ropt to change horfes at his house ; he thouzhe he recollected the quee?, and imsgined that the hing's face referbbed the inyprethons Itimped upon allighas. The efoot of dragons increaf.d the fuppion. He fuffed them to aratat

II o'clock without notice; but taking a companion with him, he went by a fiorier road to Varemes. With the altillance of the poltmanter there lee gave the alarm, and ovestumnod a carriage on the brijge, which detained the soyal travellers till the mational guard of th:c place had atlembled, and the arreft was effected withuut bloudthed. "lhey were brought back to Paris by a deputation from the attembly. Ar his departure, the king low imp:udently left behind him a memorial, in which lie declared, that he never had thought any fucsitice too great for the retturation of order; bur th.it the dellutuan of the kingdom, and the triumph of anarchy, being the only reward of all his efforts, he thught it neceniasy to depart from it. He then take; a revisw of the f.ults of the new conthtution, the grievances he has fufiered; and pretefts againtt cvery thing that he had been compelled to do during his captivity.

Different parties were very diferentlyaffected by this ill-conducted and unfortunate flight of the King. A fruall republican party had already begun to appear, and during the King's abrence, attempts were made to induce the public at large to confider the royal allthoti:y as no necefliary part of a free condiaution. But the minds of mea were by no means prepared for the reception of this new dotrine. The idea, however, baving been thas publicly propored, left fome imprellions, which in time contributed to give rife to important events. By far the greater number of leading men, however, were at prefent convinced, that it was imporfible to conduct a great empire like France, well and profperoufly, without the aliiftance of an here jitary chief. They therefore determined to pafs over the affilir with as much tilence as polfible, and to haften the period when their new conitutution fhould be complete. But there is reafon to believe, that this journey was at the long-t un lighly intrumen:al in producing very fatal effects to the perional fatety of the monarch.

His fight feemed a lignal for emigration. Many of the arifocratic party iont in relignations of their feats in the national aflembly. Troops were levied on the Irontiers in the King's name; who took care, however, to difavow any comsection with fuch a procedurc. Bouille emigrated, and afterwards fent to the afiembly a furious threatening letter: "You thall anfiwer (fays he) for the lives of the king and of the queen to all the monarchs of the univerfe. Touch but a fingle hair of their heads, and not one Itone dhall be left upon anether in Paris. I know the ruads. I will condua the foreign armies. This leter is but the forerumer of the manifent of the fovereigns of Eutope."

A coulderable calm throughout France followed theie events, and it might be regaided $a$ s in a itate of tranquillity. It contansi, indced, parties catertaining much animufity againll each other, and many citicens had withdrawn to foreign countries; but the peace was not broken, and moderate mon hoped that much profperity would follow from the lite agitations. But this calen was deluive : and in the midit at it thole pre jeets were formed which seere alterwards to prove fo datal to the peace of France and of Europe. Towards the clofe of thi fummer, a convention touk place at Pilnitz in Sax. uny between the cmperur leopuld and the ling of Prufinit Its objear was not known at the time, but it gradually c.mme into view, and is now by mary under-

French ftood to have been intended for the purpofe of concluding Revolution a league for the invalion of France, the new- modelling 179 I. of its governmert, and the partition of fome of its fatr-
eft provinces. The following paper has been repeated. ly publifhed as the copy of a treaty concluded and figned at Pavia, and is generally muderfood in have been identical with, and therefore known by, the name of the Treaty of Pilitz. We are far from vouching for its authenticity. It may have been labicated by the French affembly, to unite all parties in the nation againft the foreign powers which threatened to invade them. But in nating the events of this tevolution, it is perhaps fill more neceflary, for the purpole of rendering the actions of mon comprehewlible, to give an account of what was at the time beliewed to have occurred, than it now is to afcertain what was actually true.

Partition Tranty leizeen the Cuurls in Concert, concluded and figred at Pavit, in the Mlonth of Fuly 1 yリs.
His majefty the emperor will take all that Lonis XIV. conquered in the Autrian Netherlands, will give them to his ferene highnefs the clector Palatine; fo that thefe new polfeftions, added to the Palatinate, may hereafter have the name of Aufloffu.

His majefty will preferve for ever the property and poffefinn of Bavaria, to make in future an indivifible mafs with the domains and hereditary pufleffions of the houfe of Aultria.

Her ferene highnefs the archduchefs Maria Chritina fhall be, conjointly with his ferene highnefs her nephew the archduke Charles, put inte hereditary poffeffion of the duchy of Lorraine.

Alface flall be refored to the empire; and the biflop of Strafoourg, as well as the chapter, fhall recover their ancient privileges, and the ecclefiaftical fovercigns of Germany flial! do the fame.

If the Swifs Cantons confent to accede to the coalition, it may be propofed to them to annex to the Helvetic league the bilh pric of Porentrui, the defiles of Franche Com:c, and even thofe of Tyrol, with the neighburing bailiwicks, as well as theterritory of Verfoy, which int rects the Pays de Vaud.

Should his majefty the king of Sardinia fubferibe to the cnalition, L.: Breffe, Le Dugey, and the Pays de Gex, ufurped by France from Savoy, thall be reftored to lim .

In cale his Sardinian majefly can make a grand diverion, he fhall be fuffered to take Dauphinć, to belong to him for ever as the neareft defcendant of the ancient dauphins.

His majefts the king of Spain fiall have Roufillon and Bearn, with the infand of Corlica; and he ihatl have the French part of the ifland of St Domungo.

Her majefty the emprefs of all the Rullias thall take upon herfelf the invation of Poland, and at the fame time retain K .miniech, with that part of Podolia which borders on Mo!divis.

His majefty the emperor fhall oblige tise Porte to give up Choctim, as well as the fmall forts of Servid, and thefe on the river Lurna.

His majefty the king of Prufla, by mans of the sbovementinned invafion of the emprefs of all the Ruf. fias into Pcland, Mall make an acquiftion of Thorn and Dantric, and there unite the Palatinate on the calt of the confines of Silefia. Vos. XVI.

His majefty the king of Prufia fhall befides acquire Luface ; and his ferene highnefo the elector of Savony thall in exchange receive the reft of Poland, and cc-

Freach cupy the throne as hocreditary fovercign.

His majefty the prefint king of Poland hall abdicate the throne on receiving a fuitable annuity.

His royal highnefs the clector of Stxony flall give his daupliter in marriage to his ferenc highnefs the youngeft fon of his royal highnefs the grand duhe of all the Ruflas, who will be the father of the race of the hereditary kings of Prland and Lithania. (Signed) Leupold. Prince Nassau. Count Florida Blan. ca. Dischoffswerdek.
In the mean time, the national affembly was haforning faft to the completion of the new conftitution. It was finithed on the 3 d of September, and prefentIt was fimithed on the 3 d of September, and pretent- clurtal iy
ed to the king. It begins with the following decla- the afi reration of the rixhts of a man and a citizen, and $l \mathrm{l}$ y. thereafier follow the different branches; the chief of which are here tranflated.
I. All men are binn, and remain, free and equal in rights: focial dillinations cannot be founded but on common utility.
II. The end of all political affociations is the prefervation of the natural and imprefcriptible rights of man: thefe rights are liberty, prop=rity, fecurity, and refiftance againft oppreflion.
III. The principle of fovercignty refides effentially. in the nation: no body of men, no individun?, can exercife an authority that docs not emanate exprefsly from that fource.
IV. Liherty confifts in the power of doing evciy thing except that which is hurtful to another: hence the exercife of the natural rights of every man has no other bounds than thofe that are neceffary to enfure io the other members of focic:y the enjoyment of the fume rights: thofe bounds can be determined by the law only.
V. The luw has a right to forbid thofe actions alone that are hurtful to fociety. Whatever is not forbidden by the law, cannot be hindered; and no perfon can be contrained to do that which the law ordaineth not.
VI. The law is the expreflion of the general will: a'l the citizens have a right to concur perfonally, or by their reprefentatives, to the formation of the law: it ought to be the fame for all, whether it protect, or whether it punith. All citizens being equal in the ege of the law, are equally adnifible to dignities, places, and public offices, according to their capacity, and withoat any other ditianaion but that of their virtue and their talents.
VII. No man can be accufed, arrefed, or detained, except in cafes determined by the law, and according to the forms which the law hath prefcribed. Thoie who folicit, difpatch, execute, or caufe to be cxecuted, abitrary orders, ought to be punifled; but crery citizen that is fummoned or ficized in virtue of the law, ought to obcy inflantly-he becomes culpable by refiltance.
VIII. The law ought to eftablifh fuch punifloments only as are Atrialy and cvident:' y ncectiary ; and no pertinn can be punifhed but in virtue of a law eftablithed and promulgated prior to the offence, and legally applied.
XI. Every man being profumed innocent tiil well

Feeneh time as he has been declared guily, ii it thall be deemte a lution ed ablitutely neculfary to arrell am.m, every kind of reyp rigour cmployed, not necelliry to fecure his perfon, ou he to be fevercly reprefled by dhe haw.
X. Niu perfon thatl be molefted for his opiniuns, even fuch as are religious, provided ther the manitertation of thof: opinions dues not dilturb the public onter ctlabllitied by the lwe:

NI. The frec communication of thought, and of opinion, is one of the molt precious tights of man. Every citizen, therefore, may freely fpeak, write, and pablilh, his fentiments; fubject, howeser, to anfwer for the abule of that liberty, in cales determined by the lave.
XII. The guarantee of the Rights of Man and Citizens, inrolves a neceflity of public force: this force is then inflituted for the advantage of all, and not for the particular utility of thofe to whom it is confided.
XIII. For the maintenance of public force, and for the expences of adminiftration, a common contribution is indilpentably necellary: this contribution thould be equally divided amonglt all the citizens, in proportion to their abilities.
XIV. Every citizen has a right, by himfelf, or by his repres-matives, to decide concerning the neceffity of the public contribution; to confent to it freely; to look after the employment of it; to determine the quantity, the diftribution, the colle:tion, and duration.
XV. The fociety has a right to demand from every public agent an account of his adminiftration.
XVI. Every fociety, in which the guarantee of rights is not affured, nor the feparation of powers determined, has noconfitution.
XVII. Property being a right inviolable and facred, no perfon can be deprived of it, except when the public neceffity, legally afcertained, fhall evidently require it, and on condition of a juft and previous indemnification.

The confitution guarantees, as natural and civil rights,

1. That all citizens are admifible to places and employments without any diftinction, but that of ability and virtue.
2. That all contributions flall be divided equally among all the citizens, in propertion to their means.
3. That the fame crimes fhall he fubject to the fame punifments, without any diltinction of perfons.

The conflitution in like manner guarantees, as natural and civil rights,

Liberty to all men of going, Aaying, or depating, without beine arrelted, or derained, but according to the form preferibed by the conflitution.

Liberty th all men of fpeaking, writing, printing, and " publilhing their thoughte, without havian their vritings fubjeqed to any examination or impeation before publication:" and of exercifing the religious worhhip to which they are att ehed.

Liberty to all citizer sof atfembling peacealhy, and withatit arms, complying with the laws of police.

Liberty (f addrefing in all confitutional auh horities petitions individualy thaned.

The conllitution grarantes the inviolability of property, or a jult and previous indemnity for that of which publie necelity, legally feeved, fhall require the facrifics.

A public intrustion fhall be created and organized, common to at citiyens, gratuitous with regard to thofe parts of tuition indifpentable for all men, and of which the ellablithment flaill be gradually difuributed in a proportion combined with the divition of the kingdom.
"The kingdom is one and indivilible;" its territory, for adminill ration, is diftributed into 83 departments, each department into diftricis, each diftrict into eantons. Thole are French citizens,
Who are born in France, of : Frencla father ;
Who having been born in France of a foreign hather, have fixed their relidence in the kingdom;

Who having been bom in a forcign country, of a French tather, have returned to fettle in France, and have taken the civic oath:

In fine, who having been born in a foreign country, being defeended in whatever degree from a Frenchman or a Frenchweman, who have left their country from religions motives, come to refide in France, and take the civic oath.

The right of French citizenfhip is loft,
1ft, ly naturalization in a foreign country;
2dly, By being condemned to penalties which involve the civic degradation, provided the perion condemned be not reinftated;
${ }_{3} \mathrm{dly}, \mathrm{By}$ a fentence of contumacy, provided the fentence be not annulied;
fthly, By initiation into any foreign order or body which fuppefes either proofs of nobility " or diftinctions of birth, or requires religious vows."
"The luw confiders marriage only as a civil contract."

The fovereignty is one, indivifitle, "inalienable, an imprefcriptible," and it belongs to the nation: no fection of the people, or individual, can arrogate the exercife of it.

The nation, from which alone flow all powers, cannot exerciic them but by delegation.

The French conltitution is representative : the reprefentatives are the legiflative body and the king.

The National Anfimbly, forming the legilative body, is permanent, and confifts of one chamber only.

It thall be formed by new elections, every two years.
The legiflative body cannot he diffolved by the king.
The humber of eprefentatives to the legillative body thall be $7+5$, on account of the 83 departments of which the kingdom is compofed; and independent of thrfe that may be granted to the colonies.

The sepretentatives thall be oiftributed among the $8_{3}$. departments, actording to the three proportions of land, of population, and the coneribution direat.

Of the $7+51 \mathrm{cprefentatives} 2+7$ are attached to the land. Of thefe each depantment thall nominate thre", except the denarment of Patis, which thail tominat only one.
T'wo hundred and forty-nire reprefentatives are attached to the population. 'The total mals of the active population of the hingdom is divided into ${ }^{2}+9$ parte, and each deparment nominates ats many of the deputies as it contans pat's of the population.

Two handred and forty-ninc reprefentatives are attached to the contribution direct. The fum total of the direct contribution of the kingtom is likewite divided into 249 puts : and carla department nominates as many deputies as it pays parts of the contribution.

## R E V

French In order to form a legillative national affembly, the Revolution active citizens thall convene, in primary affemblies, every 1791. two years in the cities and cantons.
"The primary aftemblies thall meet of full right on the firf Sunday of March, if not convoked fooner by the public officers appointed to do to by the law."

To be an active citizen, it is neceliury,
To be a Frenchman, or to have become a Frenchman;

To have attained 25 years complete;
To have refided in the city or the canton from the time determined by the law;

To pay in any part of the kingdom a dired contribution, at leaf equal to the value of three days labour, and to produce the acquittance :

Not to be in a menial capacity, namely, that of a fervant receiving wages;

To be infribed in the municip.ality of the place of his refidence in the lift of the national guards;

To have taken the civic nath.
The primary affemblies fhall name electors in the proportion of the number of active citizens refiding in the city or canton ;

There fhall be named one elector to the affembly, or not, according as there fhall happen to be prefent 100 adtive citizens.

There fhall be named two, when there fhall be prefent from 151 to 250 , and fo on in this proportion.

The electors named in each department thall convene, in order to choofe the number of reprefentatives, whofe nomination fhall belong to their department, and a number of fublitutes equal to the third of the reprefentatives.
"The affemblies thall be beld of full right on the laf Sunday of March, if they have not been before convoked by the public officers appointed to do fo by law."

All active citizens, whatever be their fate, profeffion, or contribution, nay be chofen reprefentatives of the nation.

Excepting, neverthelefs, the minifters and other agents of the executive power, \&c.

The members of the legiflative body may be re-elected to a fubfequent legillature, but not till after an interval of one legiflature.

No active citizen can enter or vote in an aftembly if he is armed.

The reprefentatives fhall meet on the firft Monday of May, in the place of the fittings of the laft legifldture.

The royalcy is indivifible, and delegated hereditarily to the race on the throne from male to male, by order of primogeniture, to the perpetual exclution of women and their defecndants.

Notling is prejudgred on the effect of renunciations in the race on the throne.

The perfon of the king is inviolable and facred; his only title is king of the French.

If the king put himfelf at the head of an army, and direct the forces of it againt the mation, or if he do not oppofe, by a formal ad, any fuch enterprife undertaken in his name, he fh ill be held to have abdicated.

If the king having gone out of the kingdom, do not return to it, after an invitation by the legillative body, within the fpace which thal! bo fised by the pro-
clamation, "and which cannot be lefs than two months," he flall be held to have abdicated the royalty.

Atier abdication, exprefs or legal, the king fhall be in tlie clafs of citizens, and may be accufed and tried like them, for acts poterior to his abdication.

The nation makes provifion for the fplendour of the throne by a civil litt, of which the legiflative body thall fix the fum at the commencement of each reign, for the whole duration of that reign.

The king is a minnr till the age of 18 complete; and during his minority there flall be a regent of the kingdom.

The regency belongs to the relation of the king, next in degree atcording to the order of fucceffion to the throne who has attained the age of 25 ; provided he be a Frenchman refident in the kingdom, and not prefumptive heir to any other crown, and have previnully taten the civic oath.

The prefumptive heir thill bear the name of Prince Ryyal.
"The members of the king's family called to the eventual fucceflion of the throne, fhall add the denomination of French Prince to the name which fhall be given them in the civil adt proving their birth; and this name can neither be patronymic nor formed of any of the qualitications abolifhed by the prefent con. ftitution."
"The denomination of prince cannot be given to any individual, and fhall not carry with it any privilege or exception to the common right of all French citizens."

To the king alone belongs the choice and difmiffion of minifters.
"The members of the prefent national affembly, and of the fubfequent legiftatures, the members of the tribunal of appeal, and thofe who naall be of the ligh jury, cannut be advanced to the minitry, cannot receive any place, gift, pention, allowance, or commiffion of the executive power or its agents during the continuance of their functions, or during two years after ceafing to exercife them : the fame fhall be obferved refpecting thofe who thall only be inicribed on the lift of high jurors as long as their infeription fiall continue."

No order of the king can be executed if it be not figned by him, and counterfigned by the minifter or comptroller of the department.

In no cafe can the written or verbal order of a king fhelter a minifter from refponfibility.

The contlitution delegates exclutively to the leginia. tive body the powers and functions following;

T'o propofe and decree lans-The king can only invie the legilative budy to take an object into confideration;

To fix the public expences;
To eftablith the public contributions, to determine the nature of them, the amount of each fort, the duration, and the mode of collection, Ec.

War cannot be refolved on but by a decree of the national affembly, palfed on the iormal and neceffary propoficion of the king, and fanctioned by him.

Duning the whole courfe of war, the legiflative body may require the king to negociate peace; and the king is bound to yilld to this requitition.

It belongs to the legillative body to ratify treaties of

## 

Tr:ach pence, ailimice, andecmmorec ; and no treaty fmallhave Ros hinkn effet blet by this ratiticat:on.
the The deliberations of the legilative bedy thatl he peblic, and the n inutes of the littings 17 all be printed.

The lesillative body may, bowerer, on any occalion, form itelf into a gener,l committce.

The plan of a decree tha! be read thrice, at three :aterval, the thortelt of which cannet be lefs than eight days.

The decrees of the legilative body are prefunted to ti.e king, who may refufe then his confent.

In cale (if a refuial of the royal confent, that refufal 3 eniy fuipenfive. When the two following legiflatures thall fuccellively prefent the fame decree in the frune eerms on which it was origin.lly conceived, the ling thall be deemed to have given his fanction.

The king is bound to exprefs his confent or refufal to each decree within two months after its prefentaLien.
No decree to which the king has refufed his confent ean be again prefented to him by the fame legiflature.

The fupreme cxecutive power refines exclufively in the hards of the king.

The king is the fuprene head of the land and fea forces.

Tha kiry nanies anmathadors, and the other agents c! political neynciations.

He beftows the command of armies and fleets, and C..e ranks of marilat of France and admiral :
[fe neves two-chirds of the rearadmirals, one-half If the licutenant-generals, camp marflats, caprains of L.i. s , and colree's of the national gendarmerie :

He names a tind of the colenels and lieutenant-colonels, and a fixit of the lientenants of thips:

He appoints in the civil adminiftration of the marine, the diredtrs, the comptroliers, the treafurers of the arienals, the mafters of the works, the under mafiers of civil buildinge, half of the mafters of adminiftration, ard the under mafers of conftruction.

He apioints the commidaries of the tribunals:
He appoints the fuperintendents in chief of the manarement of cortuibutions indircet, "and the adminiteration of natiomal domains:"

He fuperistends the coinage of mones, and appoints r.ficers entrufted with this fiperin:endance in the g:neral coramilion and the mints.

The ettigy of the king is ftruck on all the coinage of the kingdrm.

There is in each department a fuperior adminiatrati $n$, and in each diftriat a fubordinate adminilration.

The adminifirators are fpeci.dly charged with cithih, uting the contribustions direct, and with fipenintend. ing the money arifing fo $m$ the contributions, and the public revernes in their territory.

The hing has the right of annulling firch aets of the admiriltratirs of depatment as are contran', to the lal. or the orders trammited to them.
$\mathrm{H}=$ may, in cafe of obrlinate dilibedience, or of Ahir eratinere ing, by theirat the tafety or pace of the futlic, tufyend them ir mo their funclions.

The ling in ane can inturive in fureign pulitical conne "!icns.

Eevey declaration of wa: thent be made in thefe

The judicial power can in no cate be exercied either by the legitative boly or the king.

Jntice thall b: pratuitonly rendered by judges chofon from tince to time by whe perple, and intituted by letters patent of the king, who cannot refufe them.
"The public accufer thall be nominated by the propic."
"The ritht of citizens to terminate difputes definitively by arbitration, cannot cceive any infrangenent from the ant of the legilative power."

In criminal matters, no cilizen can be judged except en an acculation rece ved by jurors, or decreed by the legiflative body in the cales in which it belongs to it to profecute the accufation.

After the accufation thall be admitted, the fact fhall be examined, and declared by the jurors.

The perfon accufed thall have the privitege of chatlenging 20, "without anfigning any reaton."

The jurors who declare the fat thall not be fewer than 12 .

The application of the law flall be made by the judges.

The procefs fhall be public; "and the perion accufed cannot be denied the aid of comiel."

No namanatuited by at legal jury can be apprehended or accufed on account of the fame fact.

Fur the whole kingdom there thatl be one tribunal of appeal, eftablilhed near the legill ative body.

A high national court, compoled of menbers of the tribunal of appeal and high jurors, thath take cognizance of the crimes of minillers, and the principal agents of the executive power; and of crimes which attack the general fifety of the fitte, when the legiflative body thall pats a decree of accufation.

It thall not affemble but on the proclamation of the legiflative body ; "and at the diftance of 30,000 toifes at leaf from the phace of meeting of the legillative body."

The national guards do not form a military body, or an inflitution in the fate; they are the citizens themelves called to aflift the public force.

Officers are chofen for a time, and cannot again be chofen till after a certain interval of fervice as privates.

None thall command the national guard of more than one diftrict.

All the parts of the public force employed for the fufety of the thate from foreign enemies are under the command of the king.
Public contributions fhall be debated and fixed eve:y yar by the leriflative body, and camot continue in fonce longer than the lalt day of the following fefdion, if they are not exprefsly rentwact.
"Detailed accounts of the expence of the miniterial departmonts, figned and certified by the minitters or comptrollers-general, thatl be printed and publithed at the commencenemt of the fellions of cach legillature.
" The fame nall be done with the fatemants of the recsipt of the different taxes, and all the public revenues."

The French mati in renounces the undertaking of ary War with a view of making conquefts, and will never employ its fereesagaind the liberty of any people.

The conntuthing national affembly declares, "That

French the nation has the imprefcriptible right of changing Revolution its conftutuon; and neverthelefs confidering that it is more conformable to the national interelt to cmploy only by means provided in the conltitution itfelf, the right of reforming thole articles of $i t$, of which experience fhall have fhown the inconveniences, decrees, that the proceeding by an aftembly of revifion fhall be regulated in the form following:
"When three fuccellive legillatures thall have exprefled an uniform with for the change of any conftitutional article, the revifion demanded fhall take place.
"The next legiflature, and the following, cannet propofe the reform of any contitu ional article.
" The fourth legillature, augmented with 249 members, chofen in each department, by doubling the ordinary number which it furnifhes in proportion to its population, fhall form the affembly of revifion."

The French colonies and poffeffions in Afia, Africa, and America, "though they form part of the French empire," are not included in the prefent contitution.

With refpest to the laws made by the national affemb!y which are not included in the ate of conftitution, and thofe anterior laws which it has not altered, they thall be obferved, folong as they fhall not be revoked or modified by the legillative power.

On the I $3^{\text {th }}$ of September the King announced, by a letter to the Prefident of the Affembly, his acceptance of the conftimion. This event was ordered to be notified to all the foreign courts, and the Affembly decreed a general ammelty with refpect to the events of the revolution. On the following day the King repaired in perion to the Nation 1 Alfembly; and being conducted to a chair of fate prepared for him at the fide of the Prefident, he figned the confitutional aft, and took an oath of fidelity to it. He then withdrew, and was attended back to the Thuilleries by the whole Affembly, with the Prefident at their head. On the 30th of September, this National Afembly, which has lince been known by the name of the Corffitucnt Afcmbly, diffolved itfelf, and gave place to the fucceeding Legifative Nalional Afombly, which had been elected according to the rules pieferibed by the new conftitution.

On the character and the labours of the Confituent Afembly, we thatl only remark, that it contained many men of taients, and, in all probability, a confiderable number of men of integrity. Towards the clofe of its fefion, it affumed a very firiking character of moderation, and appears to have been completely monarchical, although its jealousy of the ancient aniftocracy prevented it from fufticiently guarding the throne araint popula violence; for a very Ariking defect in the new conftitution foon appeared. The king polfelied a vero, or negative, upin the refolutions of the legillative body : but this negative be was b-und to exercife in profor, without refponfibility, and withont the intervention of his mitifters. He had no ienate, or upper chamber, to fand between him and popular violence; and there was fomething appirently abfurd in futtlig the rote of an individual, in oppolition to the culicetive wifiom and wiil of a whole nation. In confequence of this, he was reduced to the hard alternative of yielding to every vote of the National A fiembly, or of expofing himelf perfonally to public odium.

The new Aflembly was opened by the IVing on the

7 th of Otiober, with much apparent rinion on all fides. His fpeech, recommendirg unanimity and confidence between the legiflitive and execurive powers, was received with unbounded afplaur. The character of the men who compoied the new National Aliemibly was unauficious to the Court. At the commencemert of the revolution, the great body of the people at a ditance from the capital were little interefted in tho e projest of freeden which occupied the mote enlight and the proder ened or more turbulent inhabitants of Pais. They had of rhe gradually, however, been roufed from their lethargy. members. The variety of powers conferred by the new conllitution upon the people at large, and the multiplicity of offices of which it gave them the patronage, hatl hindled in the minds of men a love of dommion, and a wifh to intelfere in public affairs. This attached them to the new order of things. The love of power, which is the lealt difguifed pafion in the human heart, and equally ftrong in the breaft of the meaneft and of the higheft of mankind, was thus, under the name of liberty, become a leading paffion throughout this wide empire. Ithcy who flattered it mof, and were moft lond in praife of the rights of the people, became fpeedily the favourites of the public. The confequerce of this was, that the new Nitional Affembly was chient compofed of country gentlemen, of principles lif hly democratic, or of men of letters who had publillied popular books, or conclucted periodical publications. The members of the Conftituent Afembly had been excluded by their own decree from holding feats in the new legiflature - The members of the latter, therefore, had little regard for a conltitution which they themfelves had not frumed, and which was not protected by the venerable fanction of antiquity.

When this Affembly firt met, it fived a verr trifing attention to formalities, and a pecv: th jealoufy of the minifters of the crown. In the mean time, the treaty of Pilnitz, alread) mentioned, began to be rumoured abroad, and France was chrown into a llate of anxious jealoufy for the fafety of its newly-acquired liberties. Although the Pıuflians and Germans (the Elector of Mentz alone excepted) all continued to temporize, the northern fowers, Sweden and Ruffis, entered into ftrict engagements to rellore the old defpotifm of France. On the gth of November, a decree was patfed, that the emigran's who, after the firt of J muary next, fhould be found affembled, as at prefent, in a hontile manncr, beyond the frontiers, fhould be confidered as guilty of a confpiracy, and fuffer death; that the Fiench Princes, and public functi maries, who thould not return before that period, fhould te punithable in the fame manner, and their property forfeited during their own lives. On the a Sth, a feises of fevere decrees was zlfo palfed againtt luch of the ejected clergy as fill refufed to take the civic oath. To buth thefe decrees the King appoled his rith, or negntive.The moderare party, who were attached io the conttitution, rejoiced at this as a pronf of the frecdums of their fovereign. But, on the other fide, it cxcind a molt viclent clamonr, and became the means of excitirg new fufpicion of the withes of the Court. At this time anfwe:s were received from the diferent ioreigu Couts to the notification fent them of the King's acceptance of the new conftitution. Thefe were general. ly conceived in a file of caution, and avoided givi $g$

the AuRuians, whom he repulfed. Hearing, however, of the defeat of Dillon, he retreated. A third party advanced to Furnes, but afterwards withdrew. La Fayette at the fame time advanced towards Bouvines, half way to Namur, frove which he afterwards retreated. The whole of thefe expeditions were ill contrived, in as much as they divided the French undifciplined troops, and expofed them in fmall bodies to the attack of veteran forces. The Auftrians were fome time before they attempted to retaliate. At length, however, on the ith of June, they attacked M. Gouvion, who commanded the advanced guard of La Fayette's army near Maubeuge. M. Gouvion was killed by a rolling bullet; but La Fayette himfelf having come up, the Auftrians abandoned the field. In the mean time, mat-
III. Two partics in l'a ris at this period, and the confequences. ters were haltening in Paris towards a violent crifis. Two parties, both of which were hoftile to the prefent conflitution, had gradually been formed in the fate. The one wifhed to give more effectual fupport to the royal authority, by eftablifhing a fenate or two chambers, to prevent the king's vote from being the fole check upon popular enthufiafin. The other party withed to fet afide royalty altogether, and to hazard the bold experiment of converting France into a republic. Thefe lait were fupported by the Jacobin club, which had now contrived to concentrate in itfelf an immenfe mafs of influence. Innumerable popular focieties were eftablifhed in every town and village throughout the provinces. With thefe a regular correfpondence was kept up by writing and by emillaries. Thus fchemes and notions were initantaneoully propagated through a great empire, and all the violent firits which it contained were enabled to act in concert: But the more inmediate engine of the republican party confitted of the immenfe population of the metropolis, whom they now endeavoured to keep in conftant alarm. For this puipofe they alleged, that an Aufrian Committee, that is to fay, a confpiracy in favour of the enemies of the country, exilted among the friends of the court. M. M. Genfonré and Briflut even offered in the affembly to prove the exillence of this pretended Auftian committee. A report was nest circulated, that the king intended to abfond from the capital on the 23 d of May. His majelty publicly contradicted thefe accuf, tions as calumnies, but they made no fmall impreflion upon the minds of the public. New decrees were now made againft the refractory clergy, but there his najefty refufed to fanction. A propofal was alfo made and decreed in the alfembly to form a canip of 20,000 men under the walls of Paris, and that for this levy every canton in the kingdom thould contribute one horfeman and four infantry. The national guard of Paris difliked the froppofil, and the king gave to it his negative. Indeed at this time the king feems to have come to a refolution of ftanding out againft the Jacobin party, to which he had for fome time yielded. The miniftry were therefore difniffed, excepting M. Dumourier, and others were appointed in their flead. By this event Dumourier juft the confidence of the Jacobin club. He faw his errer, refigned his office, and jnined the army. In the mean time a decree had been paffed, authorifing the manufacture of pikes fur the purpofe of arming cheaply the lower clafs of citizers. All means were ufed to render the king odious by inflammatory wri-

175 j R E V
tings and harangues; and in both thefe the noied incendiary Marat sook the lead.

On the 20th of June M. Roederer, the Procureur General Syndic informed the national affembly, that, contrary to law, formidatle bodies of armed men were preparing to prefent petitions to the king, and to the national affembly. A part of them Ipeedily appeared with St Huruge and Santerre a brewer at their head. They marched through the hall in a proceffi in that ry, furlafted two hours, at four o'clock in the atternon, to the number of about 40,000 . They furrounded the Thuilleries. The gates were thrown open; and on an attempt to break the door of the apartment, where the king then was, he ordered them to be admitted. His fifter the princefs Elizabeth never departed from his fide during four or five hours that he was furrounded by the multitude, and compelled to liften to every indignity. All this while Petion, the mayor of Paris, was unaccountably ablent. He at length, however, arrived, and alfo a deputation from the alfembly. The queen, with her children and the princefs de Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet expofed to mech infult. At laft, in confequence of the approach of evening, and of the entreaties of Petion, the multitude gradually difperfed.

Tlle indignities fuffered on this day by the royal fa- The more mily were in fome refpects not unfavourable to their refpectali!? caufe. A great number of the mof refpeEable inhabitants of the capital were athamed of fuch proceedings. They complained of them feverely in a petition to the affembly, and addreffes to the fame purnufe were received from fereral departments. The directory of the department of Paris, at the liead of which were M. Rochefoucault and M. Talleyrand, publifhed a declaration difapproving of the conduct of the mayor, and of M. Nanuel the procureur of the commune, whom they afterwards furpended from their offices, although they were fpeedily refored by a decree of the alfembly. At the fame time, La Fayette leaving his army fuddenly, appeared on the $26: 1$ at the bar of the national affembly. He diclared that he came to exprefs the indig. nation which the whole army felt on account of the events of the 20th: he called upon the allembly to punifh the promoters of thefe events, and to diffolve the facious clubs. The fudden appearance of La Fayette threw the Jacobins into confernation, and from that period they never ceafed to calumniatc him.

On the ift of July, on the motion of M. Jean de The king Brie, the aflembly ordered a proclamation to be made, of Prufia that the country zuas in danger. On the 6th, the king marches gave intimation that the king of Prullia was marching againft with 52,000 men to co-operate againf France. The France. Frencl arms were at this time fomewhat fuccefsful in the Auftrian Netherlands; but the cabinet §peedily $^{2}$ thought it neceflary to order the armies to retreat: a meafure which was afterwards publicly cenfured by Marflal Luckner.

On the 7 h , a fingular feene occurred in the natien- Moderate al affembly. At the inftant that M. Briflot was about fyeech of to commence an oration, M. Lammourette bilhop of the bifhop Lyons requefled to be heard for a few minutes. Ite of Lyons. expatiated on the neceflity of union among the members of the alfembly, and of facrificing their pafions and prejudices

Trench judices on the altar of their country. Fe concluded an Revolution animated addreis with thefe words, "I.ct all who hold 1:22. in cqual detefation a republic and two chambers, and who with to mainta $n$ the contitution as it is, ritc!" The werds were leatcely pronounced when the who'e arembly farted fron their feats. Nen of all parties folemuly em'race! each c.her, and protelled their adlecrance $w$ the contlitution. A deputation announced this harpy event ta the king ; who immadiatcly came nลง com ratalated th.m in at thert ipecelt, wheh wat reccived wish infirie arplame. The only good cffect, however, proctuced by his temporary agreement was, that the deteival ol the $1 . f^{\prime h}$ of July, which was celebratell with the ufual majnificence, puffed over in tranisk quility:
Manifut On the 25 th of July, the duke of Brunfwick ilfued of $t$ : $c$ d he of
Brunlwick. at ('bentz his celebrated manifen.. It decl:ared the purpote of the intended invation of France to be the re. It ration of the French kirig to full authority. It ds. coured the national gund if Fiance refponlible for the p:-iersation of mangutlity; and threatened with the purithnent of death, ats retels to their king, thole who flould appear in arms againf the .hied powers. All men lolding offices, civil or military, were threatened in the lime manner, als well as the inbabitants of all citics. The city of Paris in particular, and the national atembly, were declared refpe mbible for every infult which mighe be offered to the toyal family. It was deelared, that if al:cy were not immediately placed in falety, the allics were retolved to inflet "on thofe who thould deferve it the moft excmplary and ever nomorable avenging panilhments, by giving up the city of Paris to miItary execution, and expoliag it to total deltruction; and the rehels who flu uld be guity of illegal ruftance 117 thould fufter the punifhments wheth they thould have injuriousto deferved." Tli is fanguinary and imputant manifefo Lous, ofcrated as a wrant tor the defrustion of the untortunnte Le sis XVI. It left no middle party in the nacion. All who wihad to preferve freedom in any form, and all who loved the independence of thear country, were infantly united. At the fame time, the reproaches zaft in the king by the Jxeolitis now gained univerfal credit. The kings of Trufia and of Hungary told the French nation, that their monarch was iectety hofs tile to the conftitu ion; and the selloration of him and his family t delpotic power was made the fole ni: Fretence for a bloody and dangerous war. But advan- The republican party faw the itdvantage which they megcous to the rojur j an par! ${ }^{2}$ whonefo ve th ise $\mathrm{l}^{\text {rife }} \mathrm{he}$ hon. hud now gained, and refived upnn the depolition of the king. The cibicf engi e whith they meant to employ in this fervice confifed of about 1500 men , who had er me to Paris at the period of the enntederation on the fth of July, and thenefire e thed Fracois, and who
fate. Both allegations ate probably true. Every motive which can intluence the mind of man mut have induced louns to with to be at a ditame from the factious and languinary capital. And the fubfequent conduct of the republicans anthorife us to belicve them cennble of the wort crime that was lacd to thear charge.

Various charges lad been brought forwad in the affemble. and La Favette, and the 8th of duoult wed La dayette
was accufedomd apprinted fir their difulion. In the nean time, on acquited. the 3 d of Augut, Petion the mayor, at the head of a deputation from the featio is of Paris, appeared at the bar, ardin a folemm deeech demanded the depolition of the king. The difeulion of the aecufaton againt Lat Fidyette was confidered as a trial of itrength between the partics: he was acquitted, however, by a majority of neanly 200 ; and the republican party, dedpaining of carying their p:in by a vote of the nationd atlembly, refolved to have recotrle to infirmedi $n$ and force.

On the evening of the $9^{\text {ith }}$ of Auguit, about 1500 $g$ nutlemen, officers of the army, and others, repaired to the palace, refolved to prited the royal fumily or to die in their defence : added to thefe were 700 Swifs guatds, with a body of cavalry amounting to about 1000. Mardat, the eommander of the national guards, a man who was fimly attached to the contitution, had proclited 2700 of that body and 12 pieces of camon. With fuch a furce, it has be.n generally thought that, by vigorous and Acady councils, the palace, which is a kind of cattle, misht have been fuccofofully defended; and what is now called a revolution might heve born the name of a rebellion. Meanwhile the affembly declared its littings permanent. Petion was at the palace late on the evening of the oth. Some apprehenfions were cntertained, or pretended to be emterninced. for his filety (for the whole of this bulinets was, on the fart of the republicans, a deap laid fcheme), and a deputiation from the affombly brought lim alway. At mid. night the toclin or alarm bell was formded, and the drums beat to arms through the city. At this inf:ant a number of the moll active leaters of the repu'blican party allembled, and elected a new conmon council or commane. 'The perfons thus irregularly chofen imantly took piffelion of the common hall, and drove o.t the lawful members; who, with that weahnefs whih which men are apt to flaink from flations of rep nfibility in perious times, readily grve place to the uners. 'The new commune fent repeated meffages to M . Mondat, sequirng his attendace upsn important bufincis. He was occupied in arranging the tr. ops in the beit order around the palace; bat fu:pecting rotling, he went to the common ball, and was there ahonihed to find a ditferent alfembly from what he expected. He was abrup:ly accuf:d of a plot to maflacre the pe ple, and ordc:ed to prion ; but as he defeended the ot iri, le was thot wath a pillol, and Santerre was appeinted in las 0 ad to command the nationd guard.

On this eventiul miglat no pertion in the palace went to bed. About lis: oclack in the munning of the oth the king defeendal into the gardnens to review the trsopi. IIe wis reccivid with houts of Tive ie rai excep.ing from the attil'ery, wh's llouted Tive la matior. The king returacd to the parace, and the mulittide cont med to collect. The hationnl guand femted undeterminced about what they were to do, as thes affembicd in divifions near the palace ; and had in tataly re-

 were ato fometimes lenominated Marjaibis, frem the place irrm which the greater numbur of them cance. Next to thele, dependence was placed in the populace w the fobutbs, it the apital. The dulisgs of the reprbibicans vacre not unkiown to the court, and both parties were forminy plans of opetation. It is fatd that $1 /=$ royal party inte . ded that ihe king and his family foculil fudjen ly leave the capital, and precesd to as freti ad dalan e as the co. Itituxion permited. The : cublicansare faid tu have insended to feize the pertion of the king, and to cosfice him in the catlle of Vincanes atll it nutional conventicalhould decide upon his

French fittance been made from within, it is probable they Revolution would have joined the royal party. But towards eight $\underbrace{1 / 92 .}$ o'clock M. Roederer procured admittance to the palace, and told the king that armed multitudes were affeabling in hoitile array around the Thuilleries; that the national guard was not to be depended upon; and that, in cafe of refiftance, the whole royal family would moft certainly be maffacred. He therefore advifed the
$\mathrm{r}_{2 \mathrm{r}}$ king to feek protection in the hall of the national af-
The royal fembly. With this advice the king, with his ufual fafanily fly cility of temper, was ready to comply; but the queen for fufety to the hall of the national afo Cembly. oppofed with vehemence the humiliating propofal. Becoming gradually, however, alarmed for the fafety of her children, fhe gave her confent; and the king and queen, the princefs Elizabeth, with the prince and
princefs royal, went on foot to the hall of the affembly. "I am come hither (faid his majefty) to prevent a great crime. Among you, gentlemen, I believe myfelf in fafety." By an article of the conftitution the affembly could not deliberate in refence of the king. The rogal family, were, therefore, placed in a narrow box feparated from the hall by a railing, where they remained for $I_{4}$ hours without any place to which they could retire for refrefhment, excepting a very fmall clofet adjoining. Herc they fat liftening to debates, in which the royal character and office were treated with every mark of infult.

When the king left the palace of the Thuilleries, he unfortunately forgot to order it to be immediately furrendered. He recollected this as foon as he reached the affembly, and fent orders for this purpofe; but it was now too late. The infurgents amounted to about 20,000 effective men. They were drawn up in tolerable order by Wefterman a Pruffian, and had about 30 pieces of cannon along with them. The gentlemen within the palace, who had affembled to protect the
122 king's perfon, were now difpirited, and knew not what
The commander of the Swifs, M. Affry, was abfent, and the captains knew not what to do ; and the national guard had no leader in confequence of the death of Mandat. About nine o'clock the outer gates were fored open ; and the infurgents formed their line in front of the palace. A bloody combat commenced chiefly between the Marfeillois and the Swifs. After a brave reffifance of about an hour, the Swifs were overpowcred by numbers, and gave way. All of them that could be found in the palace were maffacred; fome even while imploring quarter on their kries. Others efcaped into the city, and were protected by individuals. Of this brave regiment, however, only 200 iurvived; but every human being, even the loweft fervants found in the palace, were put to death. The Swifs takern prifoners in various quarters were conducted to the coor of the affembly, and taken by decree under the protection of the flate. But the fanguinary multitude infifted upon putting them to inftant death; and the affembly would, in all probability, have been unable to proted them, had not the Marfeillois interfered in their fivour.
The furpenfion of the royal authority was now decreed, and the nation was invited to elert a Concention to deternine the nature of its future government. On this uneommon occafion all Frenchmen of 21 years of . fiz were declared capabie of electing, and of being
ToL. XVI.
elected, deputies to the new national Convention. Commiffioners were, in the mean time, fent on the fame evening to give to the armies a falfe and favourable account of thefe tranfactions. The royal family were fent to the old palace of the Temple in the midft of the city, to remain there under a ftrict guard; and all perfons of rank who had been attached to them were feized and committed to the different prifons.

To give an idea of the temper of the people of Pa- Bloody ${ }^{2} 24$ ris at this time, it is proper to remark, that at the fame temper of inftant when the multitude with bloody fury were maf- the people facring the menial fervants in the palace, and could of Paris, fcarcely be reftrained from offering violence to the Swifs who were made prifoners, they would fuffer no act of pillage to pafs unpunifhed. Several attempts of this kind were accordingly followed by the inftant death of the criminals. The plate, the jewels, and money found in the Thuilleries were brought to the national affembly, and thrown down in the hall. One man, whofe drefs and appearance befpoke extreme poverty, caft upon the table an hat full of gold. - But the minds of thefe men were elevated by enthufiafm; and they conceired themfelves as at this moment the champions of freedom, and objects of terrur to the kings of the earth.

In the mean time, the fituation of France was ex-critical tremely critical, and it appeared very doubeful if the tuation of new Convention would ever be fuffered to at?mble. the whole La Fayette had accidentally got fpeedy notice of the kingdons. events of the 10 th of Augult. He advifed the magiftrates of the town of Sedan to imprifon the commifioners from the national affembly when they fhould arrive there; which was accordingly done. He, at the fame time, publifhed an addrefs to his army, calling upon them to fupport the king and the conftitution; but finding that they were not to be depended upon, on the La Fayctte 19 th Auguft he left his camp in the night, accompa- withdraws tid nied only by his ftaff and a few fervants. They took army-His the rout of Rochefort in Liege, which was a neutral country; but were met by a party of the enemy, who took them prifoners, and they were detained in Pruffian and Auftrian dungeons till autumn 1794 , when it was faid that La Fayette himfelf made his efcape; the report, however, was premature. The fevere treatment of this man was probably a confiderable error in policy on the part of the allies. His fidelity to the king is very generally admitted; and his attach. ment to the conflitution, his love of his country, his bravery, and many amiable qualities merited a better fate.

To return from this digreflion. The commifioners were foon fet at libertyat Sedan, and received with applaufe by the army of La Fayette. General Arthur Dillon at firft entered into the fentiments of La Fayette; but the politic Dumourier diverted him from lis purfofe, and by this means regained his credit with the Jacobins, and was appointed commander in chief. The other generals, Biron, Muntefquieu, Kellerman, and Cuftine, made no oppoftion to the will of the national aflembly.

Mcanwhile, the combined armies of Auftria and Prulia had entered France. The duke of Brunfwick's army was above 50,000 ftrong. General Clairfait had joined him with 15,000 Auftians, and a confiderable Z body

Ferth body cfiliclians, along with 20,000 French ennigrants; licvol tivn anoomting in all to yo,0co men. To oppose thefe,

127
7l.e cemiluned armie, enter Frane: ? great forice Dumourier had only 17,000 men collected mear the puint from which the enemy were approaching in Lusembourg. The French eminrants had given the duke of Brounwick fuch an accumet of the diftaased flate of their own country, and of the pretended dififLe:tion ut all orders of men towards the ruling faction in laris, that no refifance of any importance was expeited. When the combined troops, confilting either of heady Auftim or llungarian battalions, or of thofe well difciplined Pruffims which the great Prederick hadinured to the bele malitary dificipline, were reviewed in Germany before fetting out on their march, it is faid that the lpeatators, aniong whom the French caure was not unpopular, beheld them with anxiety and regrct, and pitied the unhappy conntry agaiult which this irrefiatibls force was directed. The foldiers and the ir odiects regrated thendelves as departing for a hunting match, or an excurlion of pleafure ; and many of the ufinal accommodations of an army were ill attendcat to, fuch as hofpitals, exe. The begimning of their progras into lrance jultified thefe expectations. Longry firrendered after a liege of 15 hours, although well firtilied, poifelled of a garrion of 3500 men, and defended by 71 pieces of cannon. The news of this eront irritated the affembly fo mach, that they decreed, that, when retaken, the houfes of the citizens fhould lee razed to the ground; and, difruaful of the officers of the army, they decred that the nunicipal officers of a town flould hereater have power to controul the deliberations of the council of war. Terdur: was nest fimmoned; and here the municipality compelled the governor M. Beaurepiare to furrender. That officer, difuppointed and curaged, fhot himfelf dead with a pifol in prefence of the council, and on the 2d of Sep-

The news of this fecond capture, and of the approach of the Pruffians, fpread an infant alarm through Paris. It was propofed to raife a volunteer army, which fhould fet out inmediately to mect the enemy. The common cotatil, which was now led by Rrbelpierre, Danton, Marat, and others of the moft fanguinary charater, ordered the alarm-guns to be fired, and the populace to be fummoned io meet in the Champ de Mars to enroll themfelves to mutrolt agranft the cnemy. The perple alfembled, and either in cunfequence of a premeditated plan, or, which is not very probable, of an intantancous movement, a number of voices exclaimed, that "the doneltie fies of the naton caghat to be dentroyed before its forcign enem'es were att.cked."
P...rties of arneed men proceeded without delay to the pations where the non juring clergy, tic Swatis offi- cers, and thofe embened tince the roth of Augut on aceount of praftes agrintt the llate, were d-tained in cullody. Th.y took out the prifoaters one by one, gave them a hind of moces trial before a jury of themither, acyustud fome fer:, and murdered the ref. Arong theto laft was the pince.s de Lamtalle. She was talken from her bed brime this ble ody tribunal, and mallacred; her l.exd was carried by the porulace to the 'Temple, to be feen by the ruten, whofe friend the was. Thefe mandictes latted for two dirys, and upwards of
toco per.ons were put to death. There is fearce any French thing in hitory that can be reprefented as parallel to Revolution thens; they were commited, it is faid, by lef's than 1902. 300 men, in the midft of an immenfe city, which heard of them with horror, and in the virinity of the national alfembly, which, by going in a body, could have fut an end to them. But fuch was the conlufion and diimay of thele two difgraceful days, that no man dared to flir from his own houle; and every one believed that the whole city, excepting his own flect, was engaged in mallacre and bloodilied. The national guards were all ready at their refpetive pofts, but no mand directed them to ata : and there is too much reafon to fufper that Santurre and the chiefs of the curnmune connived, at leatt, at the tranfaation.

In the mean time, general Dumourier was taking state of ${ }^{130}$ the belt meafures to protraat the march of the enemy the Frenck till the army of Kellerman, confilting of 20,000 men, army, and could join him from Lorraine, and that of Bournonville from Flanders, amounting to 13,000 ; together with conduct of Dumouwhatever new levics Luckner night be able to fend him from Chalons. The forelt of Angorne eatends from north to fouth upwards of to miles ; it lay directly in the route of the dule of Brunfwick, who matit cither force his way acrofs it, or make a circuit of to miles by the pafs of Grandpré on the north, or by Barleduc on the fouth. The prifs that lay direatly in his route was that of Bicfme. After furveying Dillon's pofition here, he left a party of 20,000 men to watch it; and with the main body of his army took the circuitous route by Grandpré on the north. Here Dumour a mourier waited to receive him, and was attacked on the fans oblige 12 th and $13^{\text {th }}$ without fuccei's: but on the 14 th, the himen feattack of the Pruffians was irrefifible, and Dumourier retreating, gave up the pafs. On his march he was fo violently preffed by the advanced cavalry of the Pruffians, that his army, at one time, wals feized with a pa-vantage. nic, and fled bef re 1500 men; who, if they had puthed their advantage, might have difperfed it. On the 15 th , however, Damoutier encamped at St Menehould, and began to firtify it. Bourronville's army joined Dumourier on the 17 th . The duke of Brunfwick formed a plan of attacking Kellerman before his junction could be completed. 'That general arrived on the 1gth within a mile of Dumouricr's camp; the projected attack took place ; the Prufians manœurred with their ufual coolnefs and addref's they attempted to furound Lellerman's army, but this could not be accomplithed. The French tronfs preferved excellent order, while the national vivacity was conftantly thewing itfelf in chcir lhouts and patriotic fongs: 400 Fienels were killed, and 500 wounded; the lofs of the Poufians was much greater: and, in the face of the enemy, Kellerman joined Dumourier at the end of the engagement withont oppolition. At the time that the attack was made on the army of Kelle: man, an attempt was made to force Dillon's camp at Biefme by the $20,000 \mathrm{mon}$ that had been left in tos vicirity, but without fincels: and this large detachment was thus prevented frem crolfing the forett of Argonec and joining the dulie of Brunfivict. It is to be obferved, that in thefe engagemerts the French owed their fuperiurity chicfly t.) the excellence of their astillery; a circumRance which ferved to convince their enemies that they

## R E V

French had to contend with regular military bodies, and not Revolution with undifciplined multitudes, as they expectect.
1792.

132 The Pruf- Lun, near the camp of Dumourier. And here the fians diatreffed by ficknefs and falcline.

The duke of Brunfwick encamped his army at La Pruffians began to be in extreme diftefs both trom ficknefs and faminc. No temptation could induce the inhabitants of the country to carry provifions to the hoftile camp, while at the fame time the French army was abundantly fupplied.

Bournonville, with a body of 4000 men, intercepted feveral droves of cattic and other convoys of provitions deftined for the Prullians. The rain fell in torrents, and the roads were uncommonly deep. Expofed to the cold, the moifture, and want of provilions, the Prufiruns rathls ate great quantities of the grapes of Champagne. The confequence of this was, that an epidemical diltemper commenced and fpread through the army to fuch an extent, that 10,000 men at one time were unlit for duty. The duke of Brunfick, however, ftill commanded a force much more numerous than that of Dumourier ; and he las been much cenfured for not attacking his camp, and forcing him to ergage. It has been faid, that the veteran ard numerous force which lue commanded would have marched to certain vistory againft the raw troops that cppofed them ; that, having defeated Dumonrier's army, there was nothing. to oppore their march to Paris. But the duke of Brunfwick had entered France upon the fuppofition, that in its prefent diftracted ftate no regular army could be brought into the field againt him, and that the people at large were hoftile to the ruling faction. The contrary of all this had tusned out to be true. He found himfelf in the midft of an hotile people, and oppofed by fillful military chiefs. A defeat in fuch a lituation would have brought certain ruin to his army ; and even the lofs fuftained in the acquifition of a victory might have proved equally fatal. The remains of the French army would not fail to hang upon his sear; and from the difpofition of the people it appeared impoffible to afcertain to what amount that army might be fuddenly increafed. After propoling a truce, therefore, which lafted eight days, he commenced his retreat towards Grandpré, and no advantage wis gained over him in the courle of it. Verdun was retaken by the Irench on the i2th of Ociober, and Longwy on the 18th; the fiege of Thionvilie was at the fame time raifed. That fmall, but firong fortrefs, under the command of general Felix TVimpfen, had held in check an army of 133 15,000.

While the Pruflans were advancing from the northmoned and eaft, the Amftians under the duke of Saxe Teffhen vigoroully laid liege to Lifle. The council-general of the combefieged by mune anfwered the fummons of the befiegers thus, "We the Auftrians, but in vain.
have juft renewed our oath to be faithful to the mation, and to maintain libetty and equality, or to die at our poft. We will not perjure ourfelves." Such was the anfwer of thefe men who had already perjured themfelies by contributing to overturn the conftitution which they had repeatedly from to defend. The Auftrian bateries began to play upon the town on the 29th, and ware chiefly directed againft that quarter which was inhabited by the lower clafs of citizens, for the purpore of making them mutinous and feditious. This procedure was ill judzed. The lower clates of mankind are always such accuftomed to hurdihips, and they go farthelt in
fupport of any enthufaftic principle ther hove been Ficuch perfuaded to adopt. Accordingly, though a great part Revolutien of the city was reduced to a haap of ruin 2, the cirizens $\underbrace{15)^{2}}$ of Lifle became daily more obltinte. They reccived each other into the houfes that were nill Aanding, and every vatlt and cellar was occuried. Aithough u!wards of 30,000 red hot balls and Gcoo bonbs were thrown into the city, belides the effurts made by an inmenfe battering train of artillery, yet the lof both to the garrifon and people did not exceed 500 perions, moft of whom were women and children. After a formiglit of fiuiticfs l:ibour the Aultrians raifed the fiege.

Wrar had been declared argainft the king of Sardinia war do on account of the threatering appearances exhibited in clisud : that quarter. On the 20 th of Sepiumber general gants the Montefuieu entered the ter ritories of Savoy, and was kang of received at Chambery and throughout the whole Sardinia. country with marks of unbounted welcome. On the ken, \&s 20th general Anfelm, with another body of trocpe, took polfeffion of Nice and the country around it. On the 30 h general Cuftine advanced to Spires, when lie found the Auttrians drawn up in order of battle. IIe attacked and drove them through the citr, taking 3000 of them prifoners. The capture of Worms fucceeded that of Spires; Mentz furrensered by capitulation ; an 1 Frankfort fell into the hands of tbe French on the 23 d . Out of this laft place, however, they were afterwards driven on the 2 d of December.

On the zoth of September the French Natioral Cons- The nasvention affembled. It was found to contain men of all tional ecticharacters, orders, and ranks. Many diftinguilhed members of the Confituting Afembly were elected into it, and alfo feveral that had belonged to the Legillative Affembly ; even foreigrers were invitel to become Frencll legifators. The famous Thomas Paine and Dr Prielley of Ensrland were elected by certain depart. ments; but the latter declined accepting. Clouts a Pruffian, whom we formerly noticed as bringing a deputation to the bar of the confituent afembly, confliting of perfons reprefenting all the nati ons of the earth, was alio chofen. The general afpect of the new convention foowed that the republican party had acquired a decided fuperionity. On the firft day of meeting MI. Ccllot D'Herbois, who had formerly been an actor, afcended the tribune, and propofed the ctorna! abolition of royalty in France. The quettion was carried by acclama. tinn, and the houfe adjourned. Mefleges were fent to all parts of the country to intimate the decree, and by the influence of the Jacchins they were everywhere received with applaule. It was next day decteed, that all public acts thould be dated by the year of the French republic; and all citizens were declared cligible to all the vacant offices and places. The rage of republicanifm foon went fo far, that the ordinary titles of Jonfieur and Madame were abolithed, and the appellation of Cinizin fubititnted in their ftead, as more fui:able to the principles of lizerty and equality. - It may be re. marked, that in this laft trifing circumptance an attachment to the form of fpeech to which they had been accullomed appears even in its abolition: For, although the Roman orators a fdrelied their countr:mza when aitembled by the honourable ajpellation of Cili. zens, yet they never, in accofting an individun, cailed him Citizen Cato, or Citizen Contr, aceording to ithe mude now adojed in France.

French fpeeclies you made on the eth, 12 th, and fth of July Revolution 1792. to the deputation, of the confituent alfombly, thew

> what were your intentions; and the mallacres of the Thuilleries rife in evidence against you.- What have out to anfiver ?"
> Louis. "I was master at that time to price the troops to march; but I never had an intention of fieldding blood."
> Pref. "After there events, and in spite of the promises which you made on the 15 th in the constituent femblt, and on the 17 th in the town-houfe of Paris, you have perfifted in your projects against national liberty. You long eluded the execution of the decrees of the int of August, respecting the abolition of personal servitude, the feudal government, and tithes: you long refused acknowledging the rights of man: you doubled the number of the lifeguards, and called the regiment of Flanders to Versailles: you permitted, in orgies held before your eyes, the national cockade to be trampled under foot, the white cockade to be hoisted, and the nation to be slandered. At last, you rentdeed neceffary a fresh insurrection, occasioned the death of federal citizens, and did not change your language till after your guards had been defeated, when you reneed your perfidious promises. The proofs of there fats are in your observations of the 18 th of Septumbor, in the decrees of the int of August, in the miutes of the constituent alfembly, in the events of Verbfiles of the $5^{\text {th }}$ and th of October, and in the convernation you had on the fame day with a deputation of the constituent affembly, when you told them you would enlighten yourself with their councils, and never recede from them. - What have you to answer ?"
> Louis. "I have made the observations which I thought jut on the two first heads. As to the cockade, it is false; it did not happen in my presence ?"
> Pref. "You took an oath at the federation of the $14^{\text {th }}$ of July, which you did not keep. You foot tried to corrupt the public opinion, with the affiltance of Talon who acted in Paris, and Mirabeau who was to have excited counterrevolutionary movements in the provinces. -What have you to answer ?"
> Louis. "I do not know what happened at that time ; but the whole is anterior to my acceptance of the confitution."
> Pref. "Y You lavished millions of money to effect this corruption, and you would even ute popularity as a means of enfliving the people. There facts are the reflt of a memorial of Talon, on which you have made your marginal comments in your own liand-writing, and of a letter which Laporte wrote to you on the Isth of April ; in which, recapitulating a conversation he had with Rivarol, he told you, that the millions which you had been prevailed upon to throw away had been productile of nothing. For a long time you had mediataxed on a plan of escape. A memorial was delivered to you on the 28 ch of February, which pointed out the means for you to effect it ; you approve of it by marginal notes.-What have you to answer ?"
> Louis. "I felt no greater pleasure than that of reliving the needy : this proves no design."
> Pref. "On the 28 th a great number of the nobles and military came into your apartments in the cafe of the Thuillerics to favour that escape: you wanted to
> Pref. " But the refit incl of the citizens made you fenfibee that their diftrult was great; you endeavoured to discard it by communicating to the constituent alfeebly a letter, which you addreffed to the agents of the nation near foreign powers, to announce to them that you had freely accepted the confitutional articles, which had been presented to you; and, notwithitandiag, on the 2 If you took flight with a false paffport. You left behind a protect against there felf.fame constitutional
it, even before it was completed. A convention was
entered into at Pilnitz on the 24 th of July, between
Leopold of Austria and Frederic-William of Branden-
burg, who pledged themselves to re-crect in France
the throne of absolute monarchy, and you were silent
upon this convention till the moment when it was known
by all Europe.-What have you to answer?"
Louis. "I made it known as lon as it came to my
knowledge; besides, every thing that refers to this fut-
jest concerns the minster."

French Pref." Antes had hoitted the ftandard of rebellion; Revolution you favoured it by fonding three civil enmmillaries, ${ }^{\text {171). }}$ who made it their bufinefs not to reprefs the counterrevolutionills, but to juntify their proceedings. What have you to anfiver ?"

Lotis. "The infruations which were given to the commallaries mult prove what was their mitlion ; and I knew none of them when the minitlers propored them to mu."

Pr.f. "A Aignon, and the county of Vemaifin, had been unitad with France; you calused the decree to be executed; but a month after that time civil war defo. lated that country. The commilaries you fent thither halped to ravage it. What have yon to andwer :"

Louis. "I do not remember what delay has been caufed in the execution of the decree; befides, this occurrence has no pertomal reference to me ; it only concerris thoie that have been fent, not thofe who fent them."

Prif. "Nimes, Montauban, Mende, Jales, felt great thoeks during the firf duys of freedom. You did nothing to fitle thofe germens of counter-revolution till the moment when Saillamt's confpiracy became manifelly notolious.- What have jou to anfwer ?"

Louls. " 1 grave, in this refreet, all the orders which were propofed to me by the minitters."

Prif: "You fent 22 battalions againt the Narfeillois, who matehed to reduce the counter-revolutionits ci Arles. What have you to anfwer :"

Louis. "I ougbt to have the pieces referring to this matter, to give a juft anfwer."

Pref. "You gave the fouthern command to Witgenflein, who wrote to you on the 21 in of April 1792, after he had been recalled: 'A few infants more, and 1 thail call around the throne of your Majefy thoulands of French, who are argain become worthy of the withes you form for their happinef.'- What have you to anfiwer:"

Louis. "This letter is dated fince his recall; he has $n \prime t$ been employed fince. I do not recolleat this letter."

Pref. "You paid your late life guards at Coblentz; the regifters of Septeuil atteft this ; and general orders figned by you prove that you tent confiderable remittarices to Bouille, Rochefort, Yauguyon, Choifeul, Beaupre, H.unilton, and the wife of Polignac.-What have you to antiver :"

Lsuis. " When I firft learned that my life-guards aflombled beyond the Rhine, I fopped their pay: as to the reft, I do not remember."

Praf. "Iour brothers, enemies to the ftate, caufed the emigrants to wally under their banners: they railed regiments, tock up loans, and cencluded alliances in cur name: : on did not difelaim them; but at the moment when you were fully certain that you could no 1.nger crofo their projects, your intelligence with them hy a $n$ te, written by Louis Stanifaus Xavier, figned ly your two brohers, was ennceived in thefe words:
'I wrote to your, bu: it was by poof, and I could fay on thing. We are two liere, who make but one; cue in fertiments, one in prircipies, one in zeal of ferving you. We keep lifence; hecaufe, were we to hieak it too foon, it would ingure ycu: bui we foall freald as fron as we fhail be certan of gereral fuppost, and that mume..t is near. If we are fipoken to on the
part of thofe people, we fhall hear nothing ; but if on your part, we will liften: we hall purfue our road Araight. It is therefore defired that you will enable us to fay fomething. Do not ftand on ceremonies. Be eafy about your fafety: we only exif to ferve you; we are eagenly occupied with this point, and all goes on well; even cur enemies feel themielves too much interchted in your prefervation to commit an ufelefs crime which would terminate in their own dellruation. Adieu.
'L. S. Xarier and

- Charles Philifpe.o
" What have you to anfiwer :"
Lonis. "I difowned all the proceedings of my brothers, according as the conflitution proferibed me to do, and from the moment they came to my knowledge. Of this note I know nothing."

Pref. "The foldiers of the line, who were to bee put on the war eftablithment, confitad but of 100,000 men at the end of Decenbar, you therefore neglected to provide for the fafety of the fate fromabroad. Narbonne required a levy of 50,000 men, but he fopped the recruiting at 26,000 , in giving allurances that ail was ready; yet there was no truth in thefe affurances. Servan propofed after him to form a camp of 20,000 men near Paris; it was decreed by the legillative affembly; you refufed your fanction.-What have you to anfwer:"

Loris. "I lad given to the ninifters all the orders for expediting the augmentation of the army: in the month of December latt, the returns were laid before the Alembly. If they deceived themfelves, it is not my faul.."

Pref. "A flight of patriotifn made the citizens repair to Paris from all quarters. You ifined a proclamation, tending to flop their march; at the fanse time our camps were withont foldiers. Dumourier, the fucceffor of Servan, declared that the nation had neither arms, ammunition, nor provifions, and that the pofts were left defencelefs. You waited to be urged by a requeft made to the minitter Lagard, when the legiflative affembly wifhed to point out the means of providing for the external fafety of the fate, by propofing the levy of $4: 2$ battalions. You gave commiftion to the commanders of the troops to difund the army, to force whole regiments to defert, and to make them pafs the Rhine, to put them at the difpofal of your brothers, and of Leopold of Auftria, with whom you had intelligence. This fact is proved by the lettor of Toulongeon, movernor of Franche Comte.-What have you to anfwer :"

Louts. " 1 know nothing of this circumnance; there is not a word of twoth in this charge."

Pref. "You charged your diplomatical agents in favour this conlition of fueign powers and your brothers againft France, and efpecially to coment the peace between Turkey and Auftia, and to procere thereby is larger number of troops againt Franee frem the la'tw. A letter of Clooifeul-Gouflicr, ambaffidor at Confamtin ple verifies the lad.-Mrat have gus to amfiwer:"

Louis. "M. Choiftul did not ficak the thuth: no fuch thing lais cver been."
l'ref. "The Truffins advanced againf nur fiontiers: your miniter was fumrnoned on the s:h of July to give an account of the Atate of our political selations

French with Pruffia; you anfwered, on the 10th, that 50,000 Revolution Prufians were marching againlt us, and that you gave notice to the legillative body of the formal acts of the pending holtilities, in conformity to the conftitution. -What have you to anfwer?"
Louis. "It was only at that period I had knowledge of it: all the correfpondence paffed with the misifters."

Pref. "You entrufted D.bancourt, the nephe w of Calonne, with the department of war; and fuch has been the fucceis of your confpiracy, that the ports of Longwy and Verdun were furrendered to the enemy at the moment of their appearance.- What have you to anfwer ?"

Louis. "I did not know that Dabancourt wats M. Calonne's nephew. I have not divefted the pofts. I would not have permitted myfelf fuch a thing. I know nothing of it, if it has been fo."

Pref. "You have deflroyed our navg-a vaft numher of officers belonging to that corps had emigrated; there fearcely remained any to do duty in the harbours; meanwhile Bertrand was granting paffports every day; and when the leginative body reprefented to you his criminal conduat on the 5 th of March, you anifwered, that you were fatisfied with his fervices- What have you to anfwer?"

Louis. "I have done all I could to retain the offlcers. As to M. Bertrand, fince the legiflative affembly prefented no complaint againf him that might have put him in a fate of accufation, I did not think proper to turn him out of office."

Pref. "You have favoured the maintenance of abfolute government in the colonies ; your agents fomented troubles and counter-revolutions tho oughout then, which took place at the fame epoch when it was to have been brought about in France, which indicates plainly that your hand laid-this plot.-What have you to anfwer ?"'

Loutis. "If there are any of my agents in the colonies, they have not fp.ken the truth; I had nothing 10 d. with what you have juft mentioned."

Pref. "The interior of the flate was convulfed by fanatics; you avowed yourfelf their protector, in manifelting your evident intention of recovering by them your ancicnt power. What have you to anfiver :"

Iouis. "I cannot anfiwer to this; I know nothing of fuch a project."

Prcf. "The legiflative body had paffed a decree on the 20 th of Jomury agrinft the factious priefts; you furpended its esecution. - What have youto anfiver ?"

Lonis. "The conltitution referved to me the free right to refure my fanction of the decrees."

Pref. "The troubles had increafed; the minifter declared, that he knew no means in the laws extant to arraign the guilty. The legiflative body emated a frefl decree, which you likewife fufpended. - What have you to fay to tri is ?"
[Louis replied in the fame manner as in the preceding charge.]
Pref. "The uncitizen-like condut of the guards whon the conftitution had granted you, had rendered it neceffary to dibband them. The day after, you fent them a letter exprelive of your fatisfaction, and con-
tinued their pay. This fact is proved by the trea. furer of the civil lif. - What have you to anfiver :" Revolution

Louis. "I only continued them in pay till frefh 1792. ones could be saifed, according to the tenor of the dccree."

Pref. "You kept near your perfon the Swifs guards: the contitution forbade you this, and the legif. lative aflembly had exprefsly ordained their departure. What have you to anfwer?"

Louis. "I have executed all the decrees that have been enacted in this refpect."

Pref. "You had private companies at Paris, chargred to operate movements ufeful to your projects of a counter-revolution. Dangremont and Gilles were two of your agents, who had falaries from the civil lift. The receipts of Gilles, who was ordered to raife a company of 60 men, fhall be prefented to you. - What have you to anfwer ?"

Louis. " 1 have no knowledre whatever of the pro. jeets laid to their charge : the idea of a counter-tcrolu. tion never entered into my mind."

Pref. "You wifhed to fuborn, with confiderable fums, feveral members of the legillative and couftituent affemblies. Letters from st Leon and nthers evince the reality of thefe decus.-What have you to anfwcr?"

Louis. "Several perfons prefented themfelves with fimilar decrees, but I have waved them."

Pref. "Whe are they that prefented you with thofe projects?"

Louis. "The plans were fo vargue that I do no recolled them now."

Pref. "Who are thofe to whom you gave money :" Lo: is. "I gave money to nobody."
Pref. "You fuffered the French name to be reviled in Germany, Italy, and Spain, fince you omitted to demand fatisfaction for the bad treatment which the French fuffered in thofe countries. - What have you to anfwer?"

Louis. "The diplomaticai correfpondence will prove the contrary ; befides, this was a concern of the miniters."

Pref. "You reviewed the Swifs on the soth of Auguft at five o'clack in the morning ; and the Swifs were the firlt who fired upon the citizens."

Louis. "I went on that day to review all the troops that were affembled abunt me; the confituted authorities were with me, the departnient, the mayor, and municipality; I had even invited thither a deputution of the rational affembly, and I afterwards repaired into the midft of them with my family."

Pref: "Why did you draw troops to the cafle ?"
Louis. "All the conftituted authorities faw that the cafle was threatened; and as I was a conflituted authority, I had a right to defend myfelf."

Pref. "Why did you fummon the mayor of Paris in the right between the gth and 10th of Augut to the cinfle?"

Louis. "On account of the reports that were circuculated."

Pref. "You have caufed the blood of the French to be thed."

L九ruis. "No, Sir, not I."
pref. "You authorized Septeuil to carry on a

French eonfideralle trade in corn, fugar, and enffee, at HamRevelution burg. This fat is proved by a letter of s'eptenil." B79:- I.ouis. "I know nothing of what you fay."

Pref. "Why did jou affix as e:to on the decree which ordained the formation of a camp of 20,000 men ?"
$L$ ouris. "The conftutution left to me the free right of refuling my fancition of the decrees: and even from that period I had demanded the aflemblage of a camp at Soiffons."

Prefidint, addrefing the convention. "The quefions dte done with."-('lo Louis)" Louis, is there any thing that you wifh tw add?"

Louis. "I requeft a communication of the charges which I have heard, and of the pieces relating thereto, and the liberty of choofing commel for my defence.

Valaze, who fat near the bar, prefented and read to Louis Capet the pieces, viz. The memoir of Laperte and Mirabeau, and fome others, containing plans of a counter-revolution.

Louis. "I difown them."
Valaze next prefented feveral other papers, on which the act of acculation was founded, and afked the king if he recognized them. Thefe papers were tise following:

V'alazé. "Letter of Louis Capee, dated June zoth 1790, fetting his connertions with Mi abean and La Fayete to effer a revolution in the conlitution."

Louis. "I referve to myfilf to anfwer the con-tents"-(Valazé read the lettcr. )-"Itis only" a plan, in which tbere is no queftion about a counter-revolution; the letter was not to have been fent."

Valazé. "Letter of Louis Capet, of the 22d of April, relative to converfations abont the Jacobins, about the prefident of the committee of finances, and the committee of domains; it is dated by the hand of Lovis Caper."
I.ouis. "I difown it."

Valaze. "Letter of Laporte, of Thurfday merning, Manch 3 d, marked in the margin in the hand-writing of Louis Capet with Maych 3 d I79r, implying a pretended rupture between Mirabeau and the Jacub:ns."

> Ionis. "I difnom it."

V'alazé. "Letcr of Laporte without date, in his hand-writing, but marked in the margin by the land of Lonui, Caper, erntaning particulars refpecting the Laft m. ments of Aliraboan, and exprefing the care that had been taken to conceal from the knowledge of men fome ptpers of great ecncern which had been depofited with Mirabean,"
L.rois. "I difern it as well as the reft."

Trulaze. "Plan of a conlltution, or revifion of the confuntion, figned La Fayette, addreffed to Louis Capet, April Gth 1790, marked in the margin with a line in firs "wn band-witing."

Levis. "Thefe things lave boen bloted out by the conft tution."

I"atたe". "Do you know this writing ?"
roris. "I co not."
Velaz:. " Your margmal comments?"
Loui:. "I do not"
I chiafé. "Letter of Laporte of ti.e Is,th of April, marked in the margin by Lern's Capet Ayr:1 19.1791, mentiwning a converlation with Rivarol."
I.ouis. "I diforsn it."

Fretich
Fiblazer. "Letter of Laporte, marked April 16. Revolution
1791, in which it feems complaints are made of Mira- $\underbrace{17 y 2 .}$ beau, the albbé Perigord, André, and Beaumetz, who do not feem to acknowledge facrifices made for their fake."
Louis. "I diforn it likewife."
V'alaze: " Letter of Laporte of the $2{ }_{3} \mathrm{~d}$ of February 1791 , marked and dated in the hand-writing of Louis Capet; a memorial annexed to it, refpecting the means of his gaining popularity."

Lonis. "I know neither of thefe pieces."
Falaze: "Several pieces without fignature, found in the cantle of the "Hhuilleries, in the gap which was fhut in the walls of the palace, relating to the expences to gain that pepularity:"

Prefident. "Previous to an examination on this fubject, I wilh to afk a preliminary queftion: Have you caufed a prefs with an iron door to be conftructed in the caftle of the Thuilleries, and had you your papers locked up in that prefs?

Lous. "I have no knowledge of it whatever."
r'alasé. "Here is a day-book written by Louis Capet himfelf, containing the penfions he has granted out of his coffer from 1776 till 1792, in Which are obferved fome douccurs granted to Acloque."

Louis. "This I own, but it coniffs of charitable donations which I have made."

Valazé. "Different lifts of fums paid to the Scotch companies of Noailles, Gramont, Montmorencs, and Luxembourg, on the gth of July t79t."

Loris. "This is prior to the epoch when I forbade them to be paid."

Pref. "Louis where had you depofited thofe pieces which you own ?"

Louis. "With my treafurer."
Valazé. "Do you know thefe penfion-lifts of the life.guards, the one hundred Swifs, and the king's guards for 1792 ?"

Louis. "I do not."
$V$ ahazé. "Several pieces relative to the confpiracy of the camp of Jales, the originals of which are depofired among the records of the department of L'Ardêche."

Louis. "I have not the fmaltelt knowledge of them."
$I^{Y}$ alazzé. "Letter of Bouillé, dated Mentz, beaning an account of 993,000 livres received of Louis Ca pet."

Loni. "I difown it."
I'alazé. "An order for payment of 168,000 livres, figned Louis, indorled Le Bomeirs, with a letter and billet of the fame"

Louis. "I difown it."
Tralaé. "Two pieces relative to a prefent made to the wife of Polignac, and to Lavauguyon and Choifeul."

Iooris. "I difown them as well as the others."
$V^{\prime}$ "d $\mathrm{l}^{-c}$. "Here is a note ligned by the two brothers of the late king, mentioned in the delaratiry aet."

Louis. "I know nothing of it."
T"aze. "Here are pieces selating to the affiir of Cho 'fenl-Gouffier at C'nill minnu.e,"

Lo:is. "I have no hnowledge of them."

## R EV

Fienth Falan: "Here is a letter of the late king to the prefumed funficient to carry it." He appaicd to cternal Reach Revolution bifhop of Clermont, with the anfwer of the hater, of jullice, and facred humanity, to induce the convention R-volus on $\underbrace{\text { 10y2. }}$ the I 6 th of April 1791."
I.cui. "I difomn it."

Prefident. "Do you not acknowledge your writing and your fignct :""

Lo:is. "I do not."
Prefident "S The feal bears the arms of France."
$L$ uis. "Several per"ons made ufe of that feal."
l'aluse. "Do you acknowledge this lift of fums faid to Gilles?"
L.oris. "1 do not."

Fulazé. "Here is a memorandum for indemnifying the civil lift for the military fenfons; a letter of Dufrefie St Leon, vihich relates to it."
1/22 Louis. " 1 know none of thefe pieces."
Heisallow- When the whole had been inveltigated in this man-oltonomi- ner, the prefident, addrefling the king, faid, "I have nate his no other quetions to profufe-have you any thing own coun- more to add in your defence:"-" I defire to have a fcl; more to add in your defence" "I defire to have at papers on which it is founded. I alio defire to have a counfel of my own nomination." Barrere informed him, that his two firft requelts were already decreed, and that the detcrmination refperting the other would be made known to him in due time.

It would have been an excefs of ciucity to refure a requeft fo reaforable in itfelf; it was therefore decreed that counfel thould be allowed to the king, and his choice fell upon M. M. Tronchet, Lamuignon Malefherbes, and Defere; he had previoully applied to M. Target, who eacufed himfelf on account of his age and infirmity. On the 20 th of Dicember, the king appeared for the lalt time at the bar of the convention; and M. Defeze read a defence whicl the connfel had prepared, and which was equilly adnited for the folidity of the argument and the beatty of the compofition.

When the defence was fimifhed, the king arofe, and lolding a paper in his hand, pronounced in a calm manner, and with a firm voice, what follows: "Citizens, ycu have heard my defence; I now feeth to you, perhaps for the laft time, and declare that my counfel have alferted nothing to you but the truth; my confcience reproaches me with nothing: I never was afraid of having my conduct inveftigated ; but I ooferved with great uneafinefs, that I was accufed of giving orders for Thedding the blood of the people on the roth of Augut. The proofs I have given through my whole life of a contrary difpofition, Ihoped would have daved me from fuch an imputation, which I now folemnly declare is entire-
I43 ly groundlets."
Eut is con- The difcuffion was fatally clofed on the 16 th of fadeniaed to nuary. After a fitting of near $3+$ honrs, the punifin. death by a fmallmajorily.
to refer their fentence to the tribunal of the people. " You have either forgotten or deftrosed (faid the celebrated M. Trunchet) the lenity which the law allows to criminals, of recuiring at leaft wo-thirds of the woices to conflitute a delinitive judgnent."
The feritence was ordered to be executed in twen:y fur hours.

The king and his family had been for fome time kept And en fenarate from each other; but he was now allowed to fee cu:ed. thim, and to choofe an ceclefiaftic to attend him. The meeting, and, above all, the feparation from lis fimily, was tender in the extreme. On Monday the zit January, at eight o'clock is the n:orning, the urortunate monarch was fummoned to his fite. He afeended the fcaitold with a firm air and fep. Railing his woice, li: fud, "Frenchumen, I die innocent; I purdon all my enemies; and may France"-at this inltant the nhuman Santerre ordered the drums to beat, and the exechtioners to perform their office. When they offered to bind his hands, be ft.rted back as if about to refift; but rccollected himfelf in a moment, and fubmitted. When the inftrument of death defcended, the prieft exclaimed, "Son of St Louis, afcend to heaven." The blecding head was held up, and a few of the populace fimuted Itive la Repablique. His body was interred in a grave that was filled up with quicklime, and a guard placed around till it fhould be conitimed.

Thus fell Louis XVI. He polfeffed from nature Char. ..tr a good underfinding, which, however, was blant- of this mued by the early indulgences of a court. He had a fortunte frong fenfe of jutice, and his humaniy, was perhaps monarch. extreme. One defect rondered his virtues of little value, which was the poffefion of an irrelolute and unlieady character. Unambitious, and eafily advifed, he was without difficulty induced to change his purpofes, efpecially by his queen, whore connection with the houfe of Auftria had always tended to render his counfels unpopular. Whether he was or was not connected with the foreign invaders of his country, polferity mult decidz ; but all men of fenfe and moderation mult be convinced that he was murdered by a band of rufians. Indeed a fentence fo infamous, and in all refpects unjult, is not to be found in the rezords of hinory. The greater part of the charges brought againt him were triling. Thofe which leem to be of importance relate to conduct authorifed by the conftitution under which he acted ; and that conftitution declarel his perfon inviolable. The feverefl puniflament that he could iacur by law, was not death, but depofition; and there is no doubt, that in putting him to deatl? the Frencli nation bruke the focial compact which their reprefentatives made with him. I: a political view, this tragical event was injurious to the republican caufe throughout Europe. Fcw men out of France ventured to jullify it; and in all countries it excited the moft violent indignation againt the rulers of the nex republic.

New enemies were now haftening to join the general Rupture league againlt France. We do not mean here to enter with Great into a detail of the political Atruggles that occurred in Britain. any other ccuntry, than that in the narrative of whofe revoiution we are now engaged. It will therefore only be necelfary to remark in general, that the Britifh goverment at this time thoughe itfelf endangered by the proparation of thofe fecculative opinions which had

A 3 overturned
ment of death was awarded by a dinall majority of the conventi in, and feveral of the fe differed in opinion from the reft, refpecting the time when it thould be inficted; fome contending that it fhould not be put in execution till :Ifter the end of the war, while others propofed to take the fenfe of the people, by referring the fentence to the primary affemblies.
M. Defcze then folemnly invoked the affembly in the name of his colle:ggues, to confider by what a fmall majority the punilhment of death was pronouncad againtt the dethroned monarch. "Do not aflist Frince (added this eloquent adrocatc) by a judgment that will appear terrible to her, when five voices only were

Frefch ever:areled the Tiench monarchy. Almof all the men Revout on of property in the kingdom concursed with the miniltry
of the 10 oh $^{\text {of }}$ Augut 1792 from giving to the French Franch mation prools of his attachment to the concert Revolution of crowned heads; that he had drawn into the bame lake the Itadthohler of the United I'rovinces; that, contrary to the ticaty of 1783 , the Englilh miniftry had granted protection to the enigrames and others who have openly appeared in arms ag:init lirance ; that dicy have committed an ontrage againtt the Verench republic, by ordering the ambalador of Firance in quit Gireat britain; that the Englift have Aopped divers boats and vellels laden with corn for France, whilh, at the fane time, contrary to the treaty oi 1786 , they continue the exportation of it to other foreign countries ; that to thwart more eflicaciounly the commercial tramactions of the republic with England, they have by an act of parliament prohibited the circulation of aflignats. The convention therefore deilare, hat in confequence of thete acts of hoftility and aggrefion, the French republic is at war with the king of England and the Itadtholder of the United Pıovinces."

The abfurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who fied from the fiury of the convention, muft be obvious to every reader. The convention was confidered a rebelliousfufurpation of the government with which fuch a treity was made. The prohibition of affignats was certainly contrary to no law, and was fanctioned by every motive of expediency, unlels the convention could prove that all nations were bound by the law of nature to rik their own credit upon the credit of the French republic.

About a fortnight after this declaration againt and ${ }^{149}$ Britain, war was lilewife declared againt Spain; and again』 in the courfe of the funmer France was at war with Spain. all Europe, excepting only Swifferland, Sweden, Denmark, and Turkey.

In the mean time General Dumourier, who was pro- Progrefs of ceeding agreeably to his orders, made an attack upon DunonHolland; but in doing this he difperfed his troops in rier.
fuch a manner as to expofe them much to any attack on the fide of Germany. He commanded Ceneral Miranda to invelt Maeftricht, while he advanced to block up Breda and Bergen-op-zoom. The firtt of thefe places, viz. Breda, furrendered on the 2 th of February ; Klundert was taken on the 26 h ; and Gertruydenberg on the $4^{\text {th }}$ of March. But here the triumphs of Dumourier ended. The fieges of Williamftadt and Bergen-opzoom were vigoroully but unfuccefsfully prefled. On He is ic the if of March General Clairfait having palled the feated. Koer, attacked the French poits, and compelled them to retreat with the lofs of 2000 men.

The following day the archduke attacked them anew with confiderable fuccefs. On the 3 d the French were driven from Aix-la-Chapelle, with the lofs of 4000 men killed and 1600 taken prifoners.

The fiege of Mactricht was now raifed, and the French retreated to Tongres, where they were alfo attacked and forced to retreat to St Tron. Dumourier here joined them, but did not bring his army along with him from the attack upon Hollind. After fome fkirmithes a general engagement took place at Neerwinden. It was fought on the part of the Frencla with great obftinacy ; but they were ar length overpowered by the number of their enemies, and perhaps alfo by the treachery of their commander. This defeat was fatal. The French lolt 3000 men, and 6000 imnediately

$$

\end{array}\right] \quad \mathrm{REV}
$$

lrouch immediatcly deferted and went home to France. DumouRevolution lier contmued to retreat, and on the 22 d he was again 1793.

152 And jouns the allies: attacked near Louvain. He now, through the medium of Colonel Mack, came to an agreement with the Imperialifts that his retreat fhould not be ferionfly interrupted. It was now fully agreed betwcen him and the Imperialites, that while the latter took polfefion of Condé and Valenciennes, he fhould march to Paris, difolve the convention, and place the fon of the late king upon the throne.

The rapid retreat and fucceflive defeats of General Dumourier rendered his conduct fufpicions. Commiffiomers were fent from the executive power for the purpofe of difoovering his deligns. They difembled, and pretenced to comnunicate to him a feheme of a comn-ter-revolution. He confeffed his intention of diffolving the convention and the Jacobin club by force, which he faid would not exift three weeks longer, and of reforing monarchy. On the report of there commiffioners the convention fent Bournonville the minifter of war to fupericde and arreft Dumourier, along with Camus, Blancal, La Marque, and Quinctte, as conmiffioners. The attempt on the part of thele men was at leaft hazardons, to fiay no more of it ; and the refult was, that on the firlt of April Dumouricr fent them prifoners to General Clairfait's head quarters at Tuar- nay as hoftages for the fafety of the royal family. He next attempted to feduce his army from their fidelity to the convention; but he fpeedily found that he had much miftaken the charater of his troops. Upon the report that their general was to be carried as a criminal to Paris, they were feized with fudden indignation ; but when they found that an attempt was making to prevail with them to turn their arms againft their country, their fentiments altered. On the 5 th of April two proclamations were iffued; one by Geneal Dumourier, and the other by the prince of Saxe Cobourg, declaring that their only purpole was to refture the conftitution of 1789,1790 , and 179 r. Prince Cobourg announced that the allied powers withed merely to co-nperate with General Dumourier in giving to France her confitutional king and the conftitution fae had formed for herfelf, declaring, on his word of honour, that he came not to the French territory for the purpofe of making conquefts. On the fame day Dumourier went to the advanced guard of his own camp at Maulde. He there learned that the corps of artiliery had rifen upon their general, and were marching to Valenciennes; and he foon found that the whole army had determined to fland by their country. Seven hundred cavalry and 800 infantry was the whole amount of thofe that deferted with Dumourier to the Auttrians, and many of them afterwards retumed.

By the defection of Dumourier, howerer, the whole
army of the north was diffolved, and in part dibanded, in prefence of a numerous, well.difciplined, and viciorious enemy. The Pruffians were at the fume time advalang on the Rhine with an immenfe force, and about to commence the fiege of Ment\%. In the inteliur of the republic more ferions evits if polible were arifing. In the departments of La Vendée and La Loire, or the Provinces of Brittany and Foitou, immenfe multitudes of emigrants and other royalifts had gradually affembled in the courfe of the winter. 'They profeffed to act in the name of Monfieur, as regent of Fiance.

About the midule of March they adranced watiall fremeh Nantz to the amount of 40,000 . In the beginning Revrurim of April they defeated the republicans in two pitched $\underbrace{179,3 .}$ battles, and poffeffed themfelves of 50 leagues ai counriy. They even thre tened by their own cfforts to ris thate the new republic to its foundation. On the \&th cungref of of April a congreis of the combined powers aftembled the curs:at Antserp. It was attended by the prince of Orange hined and his two fons, with his excellency Vander Spiege!, powers. on the part of Holland; by the duke of York and Lord Auckland on the part of Great Britain; by the prince of Saxe Cobourg, Counts Metterincl, Starenberg, and Mercy Dargenteau, with the Pruffian, Spanith, and Neapolitan envoys. It was here determined to commence active operations againft France. The prince of Cobourg's proclamation was recalled, and a fcheme of conquett announced.

Commifioners from the convention now fet up the TherepuitAtandard of the republic anew, and the ficatered bat licanarmy talions flocked around it. General Dampierre was ap- againa alpointed commander, and on the $13^{\text {th }}$ he was able to refift a general attack upon his advanced pots. On the 14 th, his advanced guard yielded to fuperior nums. bers, but on the 1 gth was victorions in a long and well-fought battle. On the 23 d the Aultrians were agtin repulfed, and on the Ift of May General Dampierre was himfelf repulfed in an attack upon the enemy. On the 8th another engagement took place, in which the French gencral was killed by a cannon ball. On the 23 d a very determined attack was made by the allies upon the French fortified camp of Famars, which covered the town of Valencienries. The French were overcome, and in the night abanduned their camp. In confequence of this the illies were enabled to commence the fiege of Valenciennes; for Condé had been blockaded from the ift of April.

Abont the fame time General Cultine on the Rline made a violent but unfucceffful attack upon the Pruffians, in confequence of which they were fuon entoled $15 \%$ to lay fiege to Mentz. The Corlican General Patil Revolt ot revolted at this period; and the new republic, afliulted Yooli. from without by the whole ftrength of Europc, was undermined by treachery and fastion within.

While the comntry was in a fate verging upon utter State of ruin, parties in the convention were gradually waxing partissin more fierce in their animofity; and regardlefs of what thence, revoluwas paffing at a diftance, they feemed only anxious for tionary trithe extermination of cach other. In the month of bunal eflaMarch, the celebrated Revolutionary Tribunal was efta- blifhat: blifhed for the purpofe of trying crimes committed argantt the Aate ; and the Girondiit party, the mildnefs of whofe adminitration had contributed not a little to increafe the evils of their country, began to fee the neceflity of adopting meafures of feverity. liut the public calamities, which now rapidly followed each other in fucceffion, were afcribed by their countrymen to their imbecility or perfidy. This gave to the party of the Mountain a fatal advantage. On the 1 th of April the communes of the 48 feaions of Paris prefented a petition, requiring that the chiefs of the Gitondifts therein named fhould be impeached and expelled frum the cosivention. This was foilowed up on the if of May by another petition from the fuburb of $\mathrm{St} A$ ntoine. The Girondilt party in the mean time impeached Marat, but he was acquitted by the jury at his trial. The

Rut in
 Nicuntain, ty the affilanse of the jacobin ciuh, hud now acquired a complete afcendency over the city of Paris. The Girond :is or Brifotires profufed there$\therefore$ re to tomove the convenion fiom the capital anal to prevert his, the Arzatim seinsed to make the fame If: © the per $:=$ of the canital agraint the Girondit pate that the had fomely hane againt the monard

 t.ec wwent on exaing the eemaining part of the month - : Juy. On the zile, at for cclock in the morning, t. : $\because c$ in was handed, the generale was beat, and the inine i...s tren. Ath was cirmotion and terror. The
 ti.t. srane ciputations demanded a decree of acculariun : anint 35 of its mombers. The day, however, was Ifert witheat decilion. On the afiernoera of the it if June in armad force made the time riemand. On she $2 d$ of Jutu this was repcated, the toctin aymin $T$ unded, and an hundred picces of ounton furrounded the 1:a i nal hall. At lat D.arere mounted the tribunc. Ile uats corfidered as a noderate man, and reficeted by beth partics; but he now artfully deferted tich (riaond ffs. He invited the denounced member, whurantily to refign their cranaler of reprefentatives. sume of them complied, and the prefident attemped to difintive the litting; but the menbers were now. impritend in their own hall. I lemriut, ormmander of the armed firce, complled them to remain; and the rbnoxions deputes, ammusting to upwards of go in number, were put under arelt, and a decree of donua. ciat on ag. in: lt them figned.

It is covieus, that on this occalion the libertes of France were todden under foot. The minarity of the national repre!entatives, by the afirtamee of an ammed lirce raited in the capital, compeiled the naja rity to fabmit th their meafures, and took the leating nemiers pritoncrs. Thas the city of Paris afimed t.. itflt the S.Inte powers of the French republic; and hae nation w :s no ionger governeci by reprefemat ve ficely chofen, Dut by a minority of their members, whe fe fentinuents the ciey of Jaris and the lacobon club had thought fit to :hrove of. Human liftory is a mats of contradiginns. '1"ue il antain yarty came into powcr by preaching li. 1 erty, ad by violating ios fundamen:al principiec. of Mentz and Valerciemnes proteacd it againt the immediate entrance of a foreigh forec, and allowed leifure for one of its internal dabtions to gain an aliendancy, ard thereafter to proteft its independence. In the mean time, the political enthurfalin of all orders of perfons was fuch, that even the female fex did not cicape Frenth fons was fuch, that even the female fex did not clicape 162
its contagion. A young woman of the name of Char- Marat lotec Corte, in the beginning of July, canse from the nurderd department of Calvades to devote lee life for what hie by a woth ughe the caufe of freedom and of her country. She requefted an interview with D1arat, the moll obnoxious of the Mountain party. Havirg obtainel it, and converted with him calmly for fome time, the fiddenly plunged a dagger in his breaft, and walked careleisly out of the howle. She was immediately ficized and condemned. At the place of execution fhe belaved with infinite conttancy, houting live la repullique. 'The remains of Marat were intersed with great iplendor, and the convention attended his fut eral. His party perhaps derived advantage from the manner if his death, as it feemed to fatten the odious charge of affatfination upon their antagonifts, and gave thom the appearance of fuffering in the caufe of lberty. The truth is, that aftatination was fanctioned by both parties under pretence of defending the liberties of the :cpublic.

One of the furt acts of the Mountain junto after their tritmph was to finith the republican confleutior. Previous to their fall, the Girondifs had brought forwatl the plan of a conlitution, cliefy the work of Condorcet; but it never was fandioned by the convention, and was too intricate to be practically ufeful. The new conlitution now framed, which was afterwards fanctioned by the nation, but has never yet been put in pracice, abolithes the firmer mode of elesting the reprefentatives of the people through the medium of ectoral affemblies, and appoints them to be chofen in,mediady by the frimary affemblies, which are made in confitt ef from 200 to 600 citizens, each man voting by ballot or open vote at his option. There is one deputy fur every 45,000 individuals, and population is the fole batis of yeprefentation. The elections tale place every year on the ift of May. Electoral afteniblics are flill retained for one purpofe. Every aco citizens in the pimary alfomblies name onc elenor: and an aliembly of all the elestors of the deparment is wite. whi, held, which eleets candidates for the execative comme', or minittry of the sepublic. 'The ligilative body chocfis out of this lift of candidates the members of the executive council. Cne half of this coment is renewed by cach leguthatere in the lath month of the ferfing. Every law, att.: it is pafied by the legiflative bostr, is tent to the deparment. If in mone t'an luatf of the cicpartunents the tenth of the primaty affemitics at each have not of joged to it, it liccomes effalual. 'lirin by jury is eftablifhed. National conventions may $\mathrm{b}_{\mathrm{a}}$ callca for altcring the connitution, and maf be callell, if required by the tenth of the primary alfomblies of ewch department in a majerity of the departments.

The publieation of this conlliation procured ro fmall degre: of appatafe to the convention and the Monntim party. The rapidity with which it was formad (bsing only a formight) feemed to caft a juit icproach upon the flownefs of their antagonifs, and it was regardedas a proof of their being decidedly fe-

of their
furces. Mentz furrendered on the 22 d of July.

At the termination of the fiege of Valenciennes it is faid that the allied powers were at a lofs how to proceed next. The Aultrian commanders ate faid to have prefented two plans: The firlt was to penetrate to Pa ris by the affinance of the rivers which fall into the Scine; the other was to tale advantage of the confter. nation occ:lfi ned by the furrender of Valenciennes, and with 50,000 light troops to penetrate fuddenly to Paris, while a debarcation fould be made on the coaft of Britany to afift the royalifts. The propofal of the Britifh miniftry was, however, adopted, which was, to divide the grand army, and to attack Weft Flanders, beginning with the fiege of Dunkirk. This determiIt is faid that the Duke of York was in fecret correfpendence with Omeron the governor of Dunkirk; mine and difeafe, that out of 4000 men, of which it originally conlificd, only 1500 were fit for fervice. The ejes of all Europe were in the mean time fixed upra the fiege of Valenciennes. Colonel Moncriefl had contended, that batteries ought immediately to be placed under the walls without ipproaching it by regulat parallels; but the Imperial engineer Mr Ferraris allerted, that the work of the great Vauban mull be treated with more refpeft; and his opinion was adopted by the council of war. The trenches wore opened on the ${ }^{1} 4^{\text {th }}$ of June. Few fillies were attempted by the garrion, on account of the fmallnefs of their number. The inlabitants at firft wifhed to furrender; but the violence of the bombardment prevented their alfembling or giving much trouble on that head to General Ferrand the governor. Murh of the labour of the fiege confifted of mines and conntermines. Some of theie having been fuccefsfully forung by the allies, the town was surrendered on the 27 th of July by capitulation to the Duke of York, who took poffeffion of it in behalf of the emperor of Germany. The fiege of Meniz vas a: the fame time going on. It fuffered much from famine. At laft, ater an unfucceisful attempt b; the French army on the Rhine for its relief, but he was removed before any advantage could be tilken of his treachery. On the 2, ith of Augult the Duke of York attacked and diove the I'rench outpofts into the town, after an acti-n in which the Aulian General D.lton was killed. A nov.ll a:manent was expected frum Great Britain to co-operate in the fiege, but it did not arrive. In the menatime, a frong re. publican force incnaced the covering army of the ahlies, which was commanded by General Freytar. He was foron attacked and totally rouied. The fiege was raifed. The Britifh loft their heawv cannon and baggare, with feveral thouf,nd men ; and the convention, believing that their General Houchard could have cut off the Duke of York's retreat, tricd and exccuted him for tius negleat of duty.

Prince Cubourg and General Clairfait in the mean time unfuccefffully attempted to befiege Cambray and Houchain. Quefioy was, however, taken by General Clairfait on the 1 th of September; and here finally terminated for the prefent campaign the fuccel's of the allies in the Netherlands.
A conliderable part of the French army of the north took a ftrong polition near Mhubeuge, where they" were blockaded by Prince Colbourg; but upon the 15 th and 16 th of Otober he was repeatedly aitacked by the French trcops under General Jourdan, who fucceeded Houchard. 'The lirench had now recovered their wigour. They brought into the ficld a formidable train of artillery, in which were many ${ }^{2}+$ pounders. Commifiuners from the convention harangued the foldiers, threatencd the fearful, and applauded the brave. Crowds of women, without confufion, went through the ranks, diftributing fpiritoous liquors in abundance, and carrying of the wounded. The attacks were repeated and terrible on both fides; but the Auftrians had confiderably the difadvantage, and Prince Coboutg retired during the night. The French now menaced maritime Flanders. They tonk Furnes and befieged Nieuport. A detachment of Britifh troops ready to fail to the Weat Indies were hakily fent to Citend, and prevented for the prefent the farther progrefs of the French.

Such was the multipilicity of the events that now occurred in France, that it is difficult to fate the outlines of them with any toler.ble peripicuity. We have already mentioned the extenfive diffenfions that occurred thronghout the republic in confequence of the triumph of the Mountain party on the 3 IIt of May. The department of Calvades was firt in arms againft the convention under the command of General Felix Wimpfen; but before the end of July the infurrection was quited, after a few flight ikirmilhes. Eut the foodera- I yons $1: \mathrm{m}$ of the cities of Marfeilles, Lyons, and Toulon, Rill fieged hy remained. Lsons was attacked on the sih of Augult the conby the conventional tronps. Several actions followed, troups, alld of the aftailants and of the befieged. The city was reduced almoft to ruins; but it held out during the whole month of September. The befieging General Kellerman was removed from his command, on accomut of his fuph fed inaativity ; and the city furrendered on the Sth wif Ofober to General Doppet, a man who had lately been: : phylician. Such was the rage of party eal zeal at this time, that the withs and pminic buildings of ing characo Lyons were ordered to be defroyed, and its mane ter of the cinnsed to that of V'lle Affrarchie. Many hundreds couquerof its citiyens were dragged to thic fedfota on accocmt of their alleged treafoaible refithance to the convention. The viforious party, wearicd by the flow upcration of the guilh tine, at late deftroyed their prifoners in multitudis, by firing grape-thot upon then. Such indect was the unvelenting charater of the Monitain at this time, not only here but through the whele republic, that they themelves pretended not to excufe it, but declated that teiror was with them the order of the day.

In the end of July Gencral Cartaux was fen l againft rin Marfeilles. In the beginaing of Augult he gained feillois fome fucceffes over the advanced foederalift tronps. On obliged te the afth he took the town of Ais, and the Marfeilluis fublume.

## に E V

Preuch R-volution 17)
$\qquad$ Toulun condutioralis lubnits t i.ond Hood,
fubmilted. But the loading people of the important twn and hab our of "houlbn entered into a negociaton, and fubuitted to the Britih atmral Lord Hood, undere onditoon that: 1 la thould peeferice as a depolit the town and Mipping for [.onis Xill, and under the Alipulation that he thould atiot in reloring the combenbion of 1 g gy. The tiege of 'loulon was commenced by Gencral Cartaus in the begining of Septembe:. It continued without muth vigour during that and the whole of the fucceeding mon'h. Neap litan, Spanifh, and Englith troops, were brought by tea to alfill in its defence. In the beginning of Novembir, General Cartux was removed to the command of the army in ! taly, and Gener.l Dugommier fucceedet him. General $O^{\prime}$ Hara arrived with reinforcements from Gibraltar, and took upon him the command of the town, under a commillion from his Britamic majefty. On the 30 th of November, the garrion made a powerful tally to deftroy fome batteries that were erecting upon heights which commanded the city. The French were furprifed, and the allies fucceeded completely in their object; but, elated by the facility of their conquelt, the allied troops ruthed forward in purluit of the flying enemy, contrary to their orders, and were unexpectedly met by a ftrong lirench force that was drawn ont to proted the fugitives. General O'Hara now came from the city to endeavourto bring off his troops with regularith. He was wounded in the arm and taken prifoner. The total lofs of the allies in this affair was eflimated at nearly one thouland men. The French had now muftered in iull force around Toulon, and prepared for the attack. It was begun on the 19th of December in the morning, and was chiefly directed againft Fort Mulgrave, defended by the Britifh. This fort was protested by an entrenched camp, 13 pieces of cannon, 36 and 24 pounders, scc. 5 mortars, and 3000 troops. Such was the ardour of allault, that it was carried in an hour, and the whole garrifon was deltroyed or taken. The allies now found it impolfible to defend the place; and in the conrfe of the day embarked their troops, after having fet on fire the arfenal and fhips. A ficene of confulion here enfued, fuch as has not been known in the hiftory of modern wars. Crowds of people of every rank, age, and fex, hurried on board the thips, to avoid the vengeance of their enraged countrymen. Sonae of the inlabitants began to fire upon their late sillies; others in defpair were feen plunging into the fea, making a vain effort to reach the thips; or putting an end at once to their nwn exitence upon the fhore. Thirty-one flips of the line were found by the Britith at Toulon; thirteen were left behind; ten were burnt; four had becr previoully fent to the French ports of Brelt and Rohlifort, wath ;000 republicans who could not be truted ; and Gicat Britain finally obtained by this expedition three thips of the line and five frigates.

On the fide of Spain the war produced nothing of imprortance; and in the mountainous coumary of Piedmont it went on fowly. Nice and Chambery were fill retained by the ['rench; but more tenithle feenes
were asiug in other पuarters. In La Vendév a moft bloody wir was parifited in by the ray lills. In that quarter of the country the langu ige of the rell of France is little undertond. The people were fuperlitious, and had acquired little ided of the new opinions that had lately been proparated in the rett of the empire. They
were chicfly headed by prietts, and regarded their caufe french
as a religious one. Their mode of wartate ufually was, Revelutua to go on in their ordinary occupations as peaceable citi- $\underbrace{17930}$ zens, and fuddenly to allimble in immente bands, info. much that at one time they were faid to amount to 150,000 men. 'Ibey befieged Nuntz and the city of Orleans, :nd even laris itfelf was not thought altegether fate from their enterpaifes. The war was iaconceivably bloody. Neither party give quarter; and I.a Vendee proved a dreadtul drain to the population of France. On the 28th of June, the conventional gemeral Biron drove the royalitts from Lucon; and Nante was relieved by general Leyller. After fome fuecefs, general Welterman was furprifed by them, and compelled to retreat to Parthenay. In the beginning ci Augut the royalifts were defeated by general Rollignol; but on the $10 i h$ of that month, under Charette their comnander in chief, they again attacked Nantz, but fuffered a repulfe. It would be tedious to give a minute detail of this obfcure but cruel war. The royalifts were often defeated and feemingly difperfed, but as often arofe in crowds :round the aftonithed republicans. At l.ft, however, about the middle of Oc tober, they were completely defeated, driven from L.t Vendée, and forced to divide into feparate bodies. One of thefe threw itfelf into the illand of Noirmoutier, where they were fuldued; another tonk the road of Maine and Brittany, where they Aruggled for fome time againtt their enemics, and were at laft cut to pieces or difperfed.

The royalifts had long expected affiftance from ling. land ; and an armament under the earl of Moira was actually fitted out for that fervice, but it did not arrive till too late, and returned home without attempting a landing.

## 173

The Mountain party always difgraced their fucceftes Horrid by dreadful cruclties. Humanity is thocked, and hifto- cruelty of ry would almoft ceafe to obtain credit, were we to tlate the Mounin detail the unrelenting cruelties which were exercifed tain jarty. againf the unfortunate royalifts, chiefly by Carrier, a deputy from the convention, fent into this quarter with unlimited powers. Multitudes of prifoners were crowd. ed on board veffels in the Loire, after which the veffels were funl. No age nor fex was fpared; and thefe executions were performed with every circumftance of wanton barbarity and inlult.

On the fide of the Rhine a great variety of events Irogrefs of occurred during the months of Augult and September. the allics Several engagements at firlt took place, in which the on the French were, upon the whole, fuccelsful. In Septem. Rhine. ber, however, Landau was invefted by the combined powers; and it was refolved to make every poflible ef. fort to drive the [rench from the ftrong lines of Weif-femb-urg, on the river Lauter. On the 13 th of October, the Auftrian general Wurmer made a grand attack upon thefe lines. The French fay that their generals bettayed them, and fuffered the lines to be taken almoft without refillance. I'Le general of the allies confelled that the lines might have held out for feveral days. The l'rench retreated to Hagenat, from which they were driven on the stoth; and fiulfered two other defeats on the a 5 th and 27 th. Some of the principal citizens of Straforurg now fent a private deputation to general Wurmfer, ofiening to furrender the town, to be preferved as a depolit to be rellored to

French Louis XVII. General Whrmier refufed to accept of
Revolution it upon thefe terms, infilting upon an abfolute firren1:9.3. der to his Imperial Majelty. In confequence of the delay occafioned by dilagreement, the negociation was difcovered, and the citizens of Strafbourg engaged in the plot were feized by St Juft and Lebas, commilioners from the convention, and brought to the feafifold. Prodigious efforts were now made by the French to recover their ground in this quarter. General Irembert was fhot at the head of the army on the gith of November, upon a charge, probably ill-founded, of treachery in the affair of the lines of Weilfembourg. On the 14 th, however, Fort Louis was taken by the allies, not without fufpicion of treachery in the governor. But hare the fuccefs of general Wurmfer might be faid to terminate. On the 21 it the republican army drove back the isuftians, and penetrated almoft to Hagenau. Anarmy from the Mcfelle now advanced to co-operate with the army of the Rhine. On the ${ }_{10}$ th the Pruffians were defeated near Sarhruck. Next day thcir camp at Bliefcaftel was formed, and the French advanced to Deux Ponts. On the 2gth and 3oth the French were repulfed with great lofs in two violent attacks made on the duke of Brunfwick near Lautern. But it now appeared that the French had come into the field with a determination to conquer whatever it might coft. Every day was a day of battle, and torrents of blood were thed on both fides. The allies had the advantage of poffeffing the ground, which, in that quatter, at fuch a late feafon of the year, is very ftrong on account of its inequalities and moraffes. In military 1 kill, the French officers and thofe of the allies were perhaps nearly equal; but the French army was by far the molt numerons; and although not a match in point of difcipline, yet it derived no fmall fuperiority from the enthufiafm with which the troops were animated. On the $\delta$ th of December, under the command of general Pichegru, the French carried the redoubts which covered Hagenau by means of the bayonet.

This moderninfrument of deftrution, againft which no defenfive weapon is employed, is always moll fuccefsful in the hands of the molt intrepid; and it was now a dreadful engine in the hands of French enthuliafm.The fineft troops that ever Europe produced were unable to withfand the fury of the republicans, which feemed only, to increafe in proportion to the multitude of companions that they lof. On the $22 d$ the allies were driven with immenfe flaughter from Hagenau, notwithftanding the immene works they had thrown up for their defence. The entrenchnients on the heights of Rheithoffen, Jauderfhoffen, \&\&c. were conlidered as more impregnable than thofe of Jemappe. They were formed by the army of the Mofelle and the Rhine, under generals Hoche and Pichegru. On the 23 d and 24 th, the allies were purfued to the heights of Wrotte. On the 26 th, the entrenchments there were forced by the bayonet, after a defperate conflior. On the 27 th , the republican army arrived at Weifembourg in triumph. General Wurmfer retreated acrofs the Rhine, and the duke of Brunfwick haftily fell back to cover Mentz. The blockade of Landau, which had hated four months, was raifed. Fort Louis was evacuated by the allies, and Kaiferflatern, Germerheim, and Spires, fubmitted to the Fiench.-During this laft month of the year 1793, the lofs of men on both fides

in this quarter was immenfe, and unexampled in the hillory of modenn war. It is even faid that it might amount to more than 70,000 or 80,000 men.

Thus far we have attended to the nilitary affairs of the republic for fome time palt. Very violent efforts were in the mean time made at l'aris by the new adminiltration, eitablifhed under the anipices of the Jacobin club, and of the party called the Monntain. The new republican connitution had been prefented to the people in the primary atiemblies, ard accepted. The bulinefs, therefore, for which the convention was called tugcther, that of forming a conftitution for France, was at an end; and it was proposed that they thould diffolve themfelves, and order a new legiflative body to affemble, according to the rules prefcribed by that arnflitution. This was, in doubt, the regular mode of procedure; but the ruling pariy confidered it as hazar. dous to convene a new afiembly, poliefling only linite. 1 powers, in the prefent dittracted tate of the connery. It was indecd obvious, that France at this time Rood in need of a difatorfhip, or of a government polfeffed of more abfolute authority than can be enjojed by on: that acts, or even pretends to act, upon the moderate principles of freedom. It was therefore determined that the convention fhould remain undiffolved till the end of the war; and that a revolutionary government, to be conducted by its members, fhould be eftablithed, with uncontrouled powers. Committees of its own body were felected for the purpofe of conducting every department of bufinefs. The chief of thefe committees was called the committee of public fafity. It fuperintended all the reft, and gave to the admimitration of France all the fecrecy and difpatch which have been accounted peculiar to a military government, together with a combination of inill and energy hitherto unknown among mankind. A correfpondence was kept up with all the Jacobin clubs througlout the kingdom. Commifioners from the convention were fent into all quarters, with unlimited authority over every order of perfons. Thus a government polfeffed of infinite vigilance, and more abfolute and tyrannical than that of any fingle defpot, was eftablifhed; and the whole tranfactions and refources of the fate were known to the rulers. On the 23 dof Auguft, Barrere, in name of the committee of public fafety, procured the celebrated decree to be paffed for placing the whole French nation in a flate of riquifition for the public fervice. "From this moment (fays the decree) till that when all enemies fhall have been driven from the territory of the republic, all Frenchmen thall be in permanent readinefs for the fervice of the army. The young men faall march to the combat; the married men fhall forge arms, and tranfport the provifions; the women thall make rents and clothes, and attend in the hofpitals; the children thall make lint of old linen; the old men thall canfe themfelves to be carried to the public fquares, to excite the courage of the warriors, to preach hatred againtt the enemies of the repullic ; the cellars fhall be walled to procure faltpetre ; the faddle-horfes thall be given up to complete the cavalry; the unmarried citizens, from the age of 18 to 25, thall march firft, and none fhall fend a fubtlitute; every battalion fhall have a banner, with this infcription, The French nation rifen againgt tyrants." The decree alfo regulates the mode of organizing this mats. A decree more ty-

Muriter oi the quecu. tri 1 , and exceutal, in coniequence of a warie:y of accufations ol'intitelity to his truft an! dire!ped to the conevention. 'The queen was neat brought to thial before the revaiutionay tribunal, on the 1 jith of Ottober. The charges :gainft her were vory vanious; but the elhief temency of them was to pr we that the had always been henfile to the revolution, and had excite.? all the efforts that had been made by the conm agan.t it. On the IGth of Ofober, this be:lutiful woman, whom fortune once phaced fo high, ended her days on a feafiold, ifter a mock trial, in which na regard was p.id either to juftice or decency. She behaved with much dignity and compofure, and appeared deeply inzpreffed with a lenfe ot religion. The members of the convention who had been at the head of the Girondit party, and had either been detained in prion fince the 3 It of May, or feized ia the departmeents to which they had rctired, were afterwards brought to trial. Onthe 3oth of Otober, 21 of them were executed, viz. Brillot, Vergniaud, Genfonné, Duprat, Lehardi, Ducos, Fonfrede, Boileau, Gardien, Duchatel, Sillery, Fauchet, Dufriche, Duperret, La Source, Carra, Beau-ty-one were fill detained in confinement. The duke of Orleans was afterwards enndemned, on a charge of having afpired to the fovereignty from the beginning of the revolution. His execution gave fatisfaction to all parties. His vote for the punithment of death upon the trial of the late king lad donc him little honour even in the opinion of the Mountain, and had rendered lim ndious to all the reft mankind.
The execmions of perions of all ranks, particularly of priefs and nobles, became now fo common, that it wouid be in vain to attempt to give any detail of then. Every perfon broucht betore the revointi mary tribunal was condemned as a matter of courfe. The Jacobins feemed infiatial: in their thirit after blowd, and the people at larye appeared to regard their condust with unaccount:able indifference.

When the human mind is nase reufed, its ativity extends $t$, every o!jeat. At this time a new table of weights and mealures was utabitithed by the convention, in which the de imal :tritamesic alone is employed. Fonch A piece of filser coin weighing a centigrave, and a Revolution franc of filver, according to the former fandard will be 1793. worth 40 fols $10 \frac{5}{5}$ deniers. The milliare, or thoufand metres, is fubftituted for the mile; and the are, for the arpent in kind-meafure. The latter two are to each other as 49 to 25. The aftronomical circles with which M. M. de Borda and Cafini made the obfervations, are divided according to this plan. The quadrant contains 100 dcgrees, and each degree $100 \mathrm{mi}-$ nutcs. Hence the minute of a great circle on our glube is cq-al to a milliare, or new French mile. If, fin the reduction of this meafure, we eftimate the Paris toife, according to the comparifon made with the fandard kept in the Royal Society of London, at 6.3925 Englifh feet, the milliare or minute will be equal to 1093.633 yards, and the metre 3.280899

A new ka- At the fame period a new kalendar was formed. lendar fernied. By it the year is made to begin with the autumnal equinox, and is divided into 12 months. Thefe are called Vindemaire, Brumaire, Frimaire, Nivos, Ventos, Pluvios, Germinal, Florial, Praireal, Meflidor, Fervidor, and Fructidor. The months confilt of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primidi, Dnodi, Tridi, \&c. to Decadi : and the day of ref is appointed for every tenth day, inftead of the ferenth. The day (which begins at midnight) is diftributed into ten parts, and thefe are decimally divided and fubdivided. Five tupernumerary days are added every year alter the zoth of Fructidor. To thefe is given the abfurd appellation of Sans Cullotidics, a word borrowed from a term of reproach (fans cullotte), whish had often been beflowed on the republican party from the meannets of their rank and fortune ; but which that party now attempted to render honourable and popular. The childifh folly of this innevation has truck every perfon wth furprize, as it can ferve no good purpofe whatever. It is a wonderful inflance of the waywardnefs of the human mind, which can occupy itfelf one moment with deeds of favage barbarity, and the next with a matter fo unimportant as the artificial divilion of time. The religion of France had heen gradually lofing its
influence; and on the gth of November, Gobet bilhop of Paris, along with a great multitude of sther ecclefiaftics, came into the hall of the convention, and folemnly refigned their furctions and renounced the Chriftian relicion. All the clergymen, whether Proteltant or Catholic, that were members of the convention, followed this example, exepting only Gregoire, whom we formerly mentioned as having been one of the firft priefts that joined the Tiers Etat after the meeting of the States General. He had the courage to profefs himfe.f a Chriltian although he faid that the emoluments of his bifhopric were at the fervice of the republic. With the acclamations of the convention, it was decreed that the only French deities hereafter Mould be Liberty, Equality, Reaton, Sic. and they would feem to have confecrated thele as a kind of new objects of worthip. What political purpofe the leaders in the convention intended to len ve by this proceeding does not clearly ap:pear; unlefs, perhaps, their object was to render the French manncrs and modes of thinking fo completely new, that it fhculd never be in their power to return to the ftate from which they had juft emerged, or to unite Vol. XVI.
in intercourie with the other nations of Eusepe. The populace, however, could not at once relinquith entirely the religion of their fathers. The Commune of Paris ordered the churches to be thut up, but the Convention found it necelfary to annul this order; and Rnbefpierre gained no fmail degree of popularity by fupproting the liberiy of religinus warkip on this occafion. Hebert and Fabre d'Eglantine, who led the oppolite party, haftened their own fall by this ill-judged contempt of popular opinion.

For, now that the republic faw itelf fuccerfful in $\begin{gathered}\text { rarels }\end{gathered}$ all quarters, when the Mountain party and the Jacobins letwera had no rival at home, and accounted themfelves in no the Monnimmediate danger from abroad, they began to fplit into facticns, and the fierceft jealoufies arofe. The Jacobin Club was the ufual place in which their contelts were carried on; and at this time Roberpierre atted the patt, of a mediator between all parties. He attempted with great att to turn their attention from private animolitics to public affairs. He fpread a report that an invafion of Great Britain was fpeedily to take place. He therefore propofed that the Jacobin Cluh thould fet themfelves to work to difonver the vulnerable parts of the Britifh conftitution and government. They did fo: They made fpeeches, and wrote eflays withcut number. And in this war the moft fierce and turbulent band of men that ever perhaps exifted in any country occupie: and amufed for a very confiderable time. What is no lefs fingular, a great number of Dritifh fubjects favoured the plans of thefe retorming Atheifs; the conduct of the gevernment giving ample fcope for cenfure.
The winter pafied away in tolerabie quietnefs, and no military enterprife was undertaken either by the allies or by the French. On the ift of Febrnary, Barrere afferted in the Convention that the confederate powers were willing provifonally to acknowledge the lirench republic, to confent to a ceffation of holtilities for two years, at the end of which a lating peace fhould be ra. tified by the French people, But this proposal the Convention declared itfelf determined to riject, as affording to the other nations of Europe the means of undermining their new government. In the mean time, the revolutionary government was gradually becoming more vigorous. Thirty committes of the Convention managed the whole bufinefs of the fate, without thaing much of the direct executive government, which refted in the committee of public fafety. Thele different committees were engaged in the utmoft variety of objects. The ruling party had no competitors for power. Without confufion or oppofition, therefire, the moft extenfive plans were rapidly carsied into effer. The Convention was little more than a court in which every project was folemnly regitered. In the fame fel: fion 30 decrees would fometimes be paffed upon objects the moft widely different. The finances were under one committee, at the head of which was Cambon.This committee, found relources for the moft lavifhex. penditure. The affignats were reccived as money throughout the ftate; and thus a paper mill was faid to have become more valuable than a mine of gold. Their the natoote credit was fupported by an arbitrary law regulating the maximum or highelt price of all provifions, and by the immenfe mafs of wealth which had come into the hands of the Convention by feizing the church lands, and by conficating the property of royalifts, emigrants, and B b

perions condemed by the sevolutionary tribumal. So umequal! had poperty been divided under the ancient government, that by nicans of thefe conlitations about feren-tcritles (f the national tersitory was fuppoded to be in the han!'s of the putlic. To this was added the
 fints, and utentils employed in divine worfaip, along wibh other atticles of lels value: among wheh may be merat. sid the innumerabie church bells, which were re:wrdelas hithciert ior the manufature of 15,000 pieces "t canwe is. 'flefe refources formed a mats of property sach is never was poffelfed by any government.
():ber cummitiees were engared in very different ob$\because$ is. 1 lighways were conftuited, and canals planned and cut throughout the country. Inmenfe manufacto-- es of armes were cverywhere cfablifhed. At Paris alone 1100 mukets were daily fabricated, and 100 pieces of cammon calt every month. Pubic fchools were affiduoully inflituted, and the French language lathert in its purity from the Pyrenees to the Rhine. 'l'ne lirech Convention pollelfed immenfe refources, ond they did not hefitate to lavifh them upon their i. hemes. Ewery fcience and cvery art was called upon if $r$ aid, and the molt accomplifhed men in every pro. feftion wae cmployed in giving fplendour to thatr coun115. The chemifts, in particular, gave cflential aid by the facility with which they fupplied materials for the mannfietre of gun-powder; and in return for their ifrvices, Lavoifier, the greatelt of them, fuffered death by a molt iniquitous femtence. Not fewer than 200 new dramatic perfurmances were produced in lefs than two years; the object of which was to attach the people to the preient order of things. The vigour with which the conimittees of fubfittence exerted themfelves is par. ticularly to be remarked. As all Europe was at war with France, and as England, Holland, and Spain, the three masitime powers, were engaged in the contef, it lad been thought not impolible to seduce France to great diftrefs by famine, cfpecially as it was imagined that the country had not refources to lipply its immenfe popultion. But the prefent leaders of that country asted with the policy of a be'ieged garrion. 'They ficized upon the whole provifions in the country, and cartised them to pablic granaries. They regittered the cattle, and made their owners refponfible for them. They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every ditrict, on ftated ucealions, what was abfolutely necefSary far fublitence, and no more. To all this the peopie fobmitted; and indeed, throughout the whole of the mixed fennes of this revolution, the caln judgment of the hiftorim is not a little perplexed. We cannot avoid adrifing the patience with which the people at large endured every bardhip that was reprefented as nece!lity $[$ () the common caufe, and the enthuliaftic energy wth which they lavifhed their blood in defence of the independence of their country. At the fame time, we mutt regand with indignation and difgut the worthlefs intrigues by means of which the finguinary factinns in the Convention and the capital alternately matfacred each orher.

During the winter the diffenfions of the Jacobins nill increafed. They were divded into two clubs, of which the new one affembled at a hall which once belonged to the Cordeliers. The leaders of it were Hc-
bett, Ron!n, Visicent, and others: but the old fociety Fracin retaincd its alcendency, and Robefpierre was now de. Revolution cidedly its leader. This extratordinary man lad gradu- $\underbrace{1794 .}$ ally accumulated in his own perfon the confidence of the people and the direction of the government. As the committees were above the Cunvention, which was become little more than a lilent court of record, fo the conmittee of public fafety was above the other comnittees. Robefpicrre was the leader of this ruling cons. mittee. Barrere, St Juff, Couthon, and others of its members, only acted a fecondary part. They labouted in the bufinefs of the ftate, but the radical power was with Robefpierre. He furrounded the nembers of the Convention with fpies. He was jealous and implacable, and fet no bounds to the thedding of blood. On the $25^{\text {th }}$ of March he brought to trial the following attive Jacobins, who were condenined and executed on the following day: Hebert, Ronlin, Mumoro, Vincent, Du Croquet, Kiocq, Col. Laumur, M. M. Bourgeois, Mazucl, La Boureau, Ancard, Le Clerc, Proly, Def: fieus, A nacharfis Cluots, Pereira, Florent Armand, Defcombes, and Debuifon. Not fatisfied with this, on the $2 d$ of April he brought to trial nine of thofe who had once been his molt vigorous affociates, Danton, Fubre d'Eglantine, Bazirc, Clrabot, Philippeaux, Camille Deimoulins, Lacroix, Delaunay d'Angers, Heratult de Sechelles, who, along with Wefterman, were executed on the evening of the 5 th.

Still, however, the preparations for the enfuing Prepara- 191 canpaign were proceeding with unabated vigour. The tions for committee for military affairs, at the head of which the camwere Carnot, La Fitte, d'Anifl, and others, was buly in arranging along the frontiers the immenfe force which the requifition had called forth. Plans of attack and defence were made out by this committee; and when ap. proved by the committee of public fafety they were fent to the generals to be executed. On the other fide, the allies were making powerful preparations for another attempt to fubjugate France. The Emperor himfelf took the ficld at the head of the armies in the Netherlands. The plan of the campaign is faid to have been formed by the Auftrian Colonel Mack. Weft Flanders was to be proteded by a frong body of men; the main army was to penetrate to Landrecies, and getting within the line of French frontier rowns, it was to cut them off from the interior by covering the country from Maubeuge to the fea. 'lhe plan was bold. It belongs to military men to judge whether this was not its only merit. When attempting to put it in execution, the allies mutt have been ill informed of the immenfe force Which the French were colleaing againt them. Eren the town of Lifle alone, which is capable of containing a numerous army within its walls, and which was to be left in their rear, fhould have fecmed an infurmountable objection to the plan.

On the 1Gth of April the Aultian, Britifl, and Dutch armies allembled on the heights above Cateau, and were reviewed by the emperor. On the following day they advanced in eight columns againft the French, drove in their whole polts, and penetrated beyond Landiecics; which place the French attempted to relieve, but withont fuccefs. 'The allied army now amounted to $187,000 \mathrm{men}$, who were difpofed in the following manner; 15,000 Dutch and 15,000 Autrians, under the prince of Orange and general Latour, formed the

## REV [ 195 ] R E V

French fiege of Landrecies; 15,000 Britifh and 15,000 AuftriRevolution ans, commanded by the dnke of York and general Otto, 1794. encamped towards Cambray. The emperor and the prince of Saxe-Cobourg, at the head of 60,000 Auftrians, were advanced as far as Guife ; 12,000 Hefft ans and Auftrians under general Worms wcre fationed near Douay and Bouchain; Count Kaunitz with 15,000 Anftrians defended the Sambre and the quarter near Maubeuge ; and, lafty̧, general Clairfait, with 40,000 Auftrians and Hanoverians, protected Flanders from Tournay to the fea; 60,000 Pruflians, for whom a fubfidy had been paid by Great Britain, were expected in addition to thefe, but they never arrived.

The French now commenced their ative operations. On the morning of the 26 th of April they attacked the duke of York near Cateau in great force. After a fevere conflitt they were repulfed, and their general Chapuy was taken prifoner. At the fame time they attacked the troops under his Imperial majefty, but were there alio repulfed in a fimilar manner; lofing in all 57 pieces of cannon. On the fame day, however, general Pichegru advanced from Lifle, attacked and defeated general Clairfait, took 32 pieces of cannon; and, in the courfe of a few days, made himfelf matter of Warwick, Wenin, and Ccurtray. On the 29th of A pril, the gas rifon of Landrecies furrendered to the allies. Wh.n this event was knuwn in the convention, it excited a confiderable degree of alarm. It was, however, the laft effequal piece of fuccefs enjoyed by the allies during this difaftrous campaign. General Clairfait was azain completely defeated by Pichegrn in a general engagement; and it was found neceffary to fend the duke of York to his affitance. This movement was no doubt unavoidahle; but the effect of it was, that it fplit down the allied army into a variety of portinns, capable of carrying on a defultory warfare, but unfit for the vigorous objects of conqueft. On the soth the duke of York was attacked near Tournay by a body of the enemy, whom he repulfed; but he was unable to join Clairfait upon whofe de-

196
Succefs of Pichegru in Weft Flanders.
ftuction the French were chiefly bent: for at the fame time that the duke of York was occupied by the attack upon himfelf, Pichegru fell upon Clairfait with fuch irrefiftible impetuofity, that he was compelled to retreat in confufion, and a part of his army appears to have fled to the neighbourhood of Brugcs. While Pichegru was thus advancing fuccefffully in Wert Flanders, general Jourdan advanced in Eaf Flanders from Maubeuge, crofled the Sambre, and forced general Kaunitz to retreat. On the 18 h , however, general Kaunitz fucceeded in repulfing the enemy in his turn, and they recroffed the Sambre with confiderabie lofs.

The allies now found that no progrefs could be made in France while general Pichegru was advancing.fuccefsfully and occupying Weft Flanders in their rear. The emperor, therefore, withdrew the greater part of his arms to the neighbourhood of Tournay, and refolved 10 make a grand effort to cut off the communication between Courtray and Lifle, thus tn prevent completely the retreat of Pichegru. On the night of the 16 th , the army moved forwards in five columns for this purpofe. Clairfait was at the fame time directed to crofs the Lss, to effeet a general junction, if poffible, and complete the plan. The attempt during that cuening feenied to promife fuccefs; but, in the courfe of next
day, the divifion nnder the duke of Yorin was over: Freach powered by numbers and defeated. The progrefs of Revolution the reft of the colunns was ftopped, and Clairfrit $\underbrace{179.1}$ completely defeated. In tbe confulion of the day, when attempting to rally the different parts of thec divifion which he commanded, the duke of York was feparated from his own troops by a party of the enemy's cavalry, and only efcaped being made prifoner by the fwifnefs of his horfe. The plan of the allies being thus fruftrated, their army withdrew to the neighbourhood of Tournay.

Pichegru fpeedily attempted to retaliate againft the allies. On the 22 d of May he brought down at day break his whole force againft them. The attack was commenced by a heavy fire of artillery, and all the advanced polts were forced. The engagement foon became general; the attacks were repeatedly renewed on both fides; the whole day was fpent in a fuzcef. fion of obftinate battles. All that military fkill could do was performed on both fides. The French andthe allied foldiers fought with equal conrage and equal difcipline. At nine o'clock in the evening the French at laft reluctantly withdrew from the attack. The day on which a vanquifhed enemy flies from the field is not always that on which the victory is ron. In this engagement the French were untuccefsful in their inmediate objest ; but the weight of their fire, their feady difcipline, and their violert obfinacy of attack, railed their militarv cliarafter high in the eftimation of the oficers and foldiers of the allied army. It was foon perceived, that in addition to thefe they poffefed other advantages. 'Their numbers were immenfe; they implicitly obeyed their generals; who, being men newly raifed, from the rank of fubalterns, as implicitly fubmitted to the directions of the committee of public fafety. A combination of efforts was thus produced whofe operation was not retarded by divided counfels. On the other fide, the numbers of the allies were daily declining; their leaders were independent princes or powerful men, whofe fentiments and interefts were often very hoftile to each other, and their exertions were confequently difunited.

On the 24 th the French again crolled the Sambre, but were driven back with much lofs. On the 27 th an attempt was made to befiege Charleroi, but the prince of Orange on the 3 d of June compelled them to raife the fiege. On the 12 th a fimilar atrempt was made, and they were again repulfed. In Welt Flan- He lays ders, however, Pichegrn was fufficiently frong to com- fiege to mence the fiege of Ypres. He was foon attacked by Yree, nen? general Clairfait for the purpofe of relieving it, but without fuccefs.-I'pres was garrifoned by 7000 men; reinforcements were therefore daily tent from the grand army to Clairfait for the purpofe of relicving it. It is unneceffary to mention the bloody contefts in whicl that unfortunate general was daily engaged with the French; it is fufficient to fay, that they wore uniformly unfuccefsful, and were the means of wafting, in a great degree, the armies of the allies. Ipres held ont till the $t$ th of June, when it capitulated :and fuch was the difipline of the French army at this time, that no notice could be obtained, for feveral days, of that event. In confequence of it and of other events, the duke of York found it neceflary to retreat to Oudenarde ; for Jourdan, after forming the Auftrian camp.

rurtior "ilhe allics now retseatedin all quarters. Nieuport, fucchis of ORend, and Bruges, were taken; and 'lournay, Mons, the French Oudenarde, and Brulfels, opened their gates. At this imfintucer, lat place the French armies of Eaft and Weft landers united. I,andrecies, Valenciennes, Condé, and Onefnoy, were fruitefsly left with ganifons in them. The allied troops, evacuating Namur, formed a line from Antwerp to Licge to proted the country behind. Whe French advanced in full force, and attacked general Clairla:t, cut to pieces half of the troops that now remained under him, and broke the line. The allies retreated befure them. The duke of York was joined hy fome trons under the earl of Moira that with much dificulty had made their way to lim from $O$ ftend ; and with thefe and the Dutch troops he retired to the meshabourhead of Dergen-op.zonm and Breda for the protection of Holland. The prince of Cobourg evacuated liege, croffed the Misle, and placed a gramion in Mueltricht. He foon, however, fent back a part of his troops to the neighbomhond of Tongres; for here, to the atonithment of all Europe, the French arnaies made a voluntary paufe in their career of vic. tory, and ceafed to purdue their retiring foes. Sluys in Dutch Flanders was the only foreirg poft that they continued to atitack, and it furrendered after a fiege of 7y) 21 days.
Ard ot the On the Rhine the war was equally fucceffful on the Rmue.

Trench embarked on board 160 fail of merchantmen, convoyed Revolution by fix fail of the line. Lord Howe failed to intercept this valuable convog. The Frendi nect failed at the lame time to protect it. On the morning of the $2 \mathrm{~S} . \mathrm{h}$ splendid of May the feets came in light of cach other. "1"he victory of Britilh admiral had previounly difpatched fix thips of the britifo the line under admiral Montague to intercept the der Lord French conwoy, while he thond erorage and detain the llowe.
grand fleet. 'llıe French difpatched eigh: fail to defeat this attempt. In the courfe of the 2 gth Lord Howe got to windward of the French fleet. His fore was 25 , and theirs was 26 , fail of the line. 'The following day he bore down upon them, and broke their line. 'l'he engragement was one of the fevereft ever fought. The lrenchadmiral, in lefs than an hour after the clofe action commenced in the centre, crouded off with 12 of his llip's. The Britifh Heet was to much difabled, or feparated, that feveral of the French dif. mantled thips got away under fails raifed on the thump of their fore-mafts. Seven fail of the line, however, remained in poffeffion of the Britilh, and two were unqueftionably funk. In the mean time, admiral Mon. lagne fell in with the French convoy, but it was now guarded by 14 fail of the line. As lie could not encounter fuch in force, he returned home, and it was fafely convejed into port. Thus, by one of thofe contradiftions which fo often occur in human affairs, the Britifh fleet was vidorious, and the French were left in fome meafure mafters of the fea. As this engagement however teftified that the Britifh feamen had not lof their ancient fuperiurity on their own c!ement, the nation regarded the prefent vidory as a pledge of its independence, and very general rejoicings took place in confequence of it.

In the mean time, the revolutionary fyftem of go- The horrid vernment in the hands of committees of the convention executans at Paris, and of committees of the popular focieties in $P_{u}$ ris throughout the country, was arrived at its higheft per- ${ }^{\text {colt inuced. }}$ fection, and proceeded without oppofition in its ferere and fanguinary meafures.

On the 1oth of May Madame Elizabeth, fifter of the late king, was facrificed by it in confequence of a decree of the revolutionary tribunal. Multitudes of others of every rank and fex were daily facrificed in a fimilar manner; the rich in particular were the great objects of perfecution, becaufe the confifcation of their property added to the Atrength of the ruling powers. But neither were the poor fife from the bloody vigilance of this new and lingular government. By the diferent executions Robefpierre had contrived to deftroy every avowed rival. All the conftituted authorities confifted wholly of perfons nominated with his approbation; and as the committees which conducted the bufinefs of the Atate were at his difpofal, his will was irreliftible throughout the republic. He met with no oppofition in the conven:ion; for that body was no longer the turbulent popular affembly which is had once appeared; it was little more than a name emplosed to give fome fort of refpectability on fuch ichemes as were propofed to it.

Amidit this accumulation, however, of feenimely ir. verging to refitibic aubority, Robefpierse was at the brink of ruan. ruin. 'lhe whole of the old Girondift party was indeed fubdued and filent; but many members of the convention ftill remained attacied to $i t$. The party of the Mountuin,

French Ifountair, by means of whom Robefpierre had rifen Revolution to power, with little fatisfaction now lound themfelves 17\%4. not oniy difregarded, but rady at every infant to fail a ficrifice to that fy fem of ierror which they had contributed to eref. Even the Jacobias themfelves, thourh neither timid nor cautions in the fled Jing of blood, began to murmur when they fiw that awful privilege confined exclufively within a few hands, or rather monopolized by an individual. In this fate things remained for fome time; and it appeared how pofible it is for an individual to govern a great nation even while the whole of that nation is honite to his powir. 'Ilic banifhment or imprifonment of all foreigners, which had long been rigorvully pradifed, preverts us from polfefling much accurate information concerning the internal date of Trance at this period; but it is cerrin, that one circumfarce in particular tended much to accelerate the fall of Robetpierre. He had procured a decree to be paffed, atitlorifing the comnittee of public fafetyto imprifon at its pleafure, and bring to tria', any member of the convention. All the individuals of that body found themfelves placed by this decree in the hands of a man whofe fevere and fufpicious temper they well knew. Still, however, they were fo much furrounded by fpies, that it was difficult to form a party or plan of operations ; even the majority of the committee of public fafedared not to withftand their chief. At laft, on the 25 th of July, the convention began to exhibit figns of agitation. It was underfood, that in the courfe of a few days Robetpierre would facrifice a number of the members to his fufpicions. On the following day the fitting of the coniention was fill more tempeftuous. In a long fipcch Robefpierre defended his own conduct againft thole who had reproached him with afpiring to the dictatorfhip of France. He attacked the party whom he ityled Miderates, as wilhing to overturn the revolutionary government, and to reftore the feeble fytem of the Brillictines. The refult of a long debate was, that Robeipierre was apparently victorinus, and his fpeech was ordered to be printed. On the 27 th the convention appeared ripe for a cliange: St Juft, a member of the committee of public fafery, in attempting to defend Robclpierre, was repcatedly interrupted; and Billaud Va:renies food forward and enumerated the crimes, and proclaimed the tyranny, of Robefpierre. The fpeech was reccived with burlts of applaufe. Robefipierre in rain attempted to defend himfelf; he was filenced by fhouts of execration fiom every part of the hall. Fallien feconded the former fpeatier in his accufation. The fitting was declared permanent, and a decrec of arreft was paffed againft Rolefpierre and a younger brother of his, along with St Jult, Couthon, and Lebas. Thefe men left the convention, and found fccurity in the hall of the commune of Paris; where the municipal officers agreed to protect and fand by them. The tocfin was founded; the amed force was under their commarid; an infurrection was therefore attempted againft the convertion : but the fections of Paris refufed their fupport. Very few of the tronps could be collected, and thefe were not firm ; the late tyranny had become ndious. The hall of the commune was therefore fpeedily furrounded; and about three u'clock in the morning of the 2 Sth Robefpierre and his alfocizes were made ptifoners. 'lley had been outawed
by the conventi $n$ on accouat of their refikance. They were not therefore tried, unlefs for the purpofe of identifying their perfons; :lrd, in the courfe of that day, they were executed: 60 of the municipal officers were alfo executed for joining in their rebellion; and in this way a ftorm paffed over, which at one time threatencd to involve the French carial in ruin, and filled all Europe with altonifliment. Jhus alio terminated the carecr of the mof extran! dinary man that the French revolution lad bronght forward. His talenis werc un. doubiedly confiderable, and his an:biticr knewno bounds, hidding ciffimce to the ordinary feelings of humanity. Had Dumourier pofelfed lis coolnes and caurion, or had he pofeffed the military talents of Dumonier, the convention would certimly have been uvcrumed, and we fonu'd lave feen a fecond Crunwill o:s the throne of his murdered fovcreign.

After the fall of Robefpicre, the convention cahi- ThefyRera bites no fmall chanse of appearance. Jnfead of that of errer filence which formeriy prevailed, all was bulle and gives place noife; all accufed each other. There vise no longer moderan ary leader, and there was no formed parts. The former tifns,
fyltem of terror was declared to be at an end, anci a new fyitem of moderatifm fucceeiled. This was carried to as great a height as the fyitem of terror had formerly been; and all means were taken to render popular the fall of their late tyrant. The committees were or ganifed anew, and their members ordered to be frequently changed. The correfpondence between the affiliaied Jacobin clubs was prohibited, and at lalt the Jacobin club itfelf was abolifhed. This laft event was accomplifhed with eafe; and that fociety which had been the great engine of the revolution, was itfelf with. out refiftance overturned. Seventy-one deputies of the Girondift party, who had been imprifoned fince the 3 It of May 1793, were fet at liberty. The name of Lyons was reftored to it. Some of the agents of Robefpierre were punithed, particularly the in famous Carrier, whofe cruelties in La Vendće we formerly mentioned. Still, however, the convention appeared fo little united and fo little decided with regard to objects of the firt importance, that in all probability they would not have conducted the important fruggle againit the nations of Europe with more fuccers than the Girondif party had formerly dor.e, if the revolutionary government and the late fyItem of terror had not already accumulated in their hands fuch valt refources, and traced out fuch a plan of procedure, as rendered it an eafy matter to preferve their numerous armies in the rrain of fuc. cefs to which they were now habituated.

The allies in their retreat had left ftrong garrifons in the French towns which had furrendered to them. towns Thefe were Condé, Valencicnnes, Quefnoi, and Lan- Arongly drecies. They now furrendered to the republican ar-parrifoned mies with fo little refiftance, that the conduct of the em . by the alperor began to be confidered as anliguous, and he was ler withfufpected of having entered into fome lind of com- out rcfittpromife with the French. This idea proved erroneous; auce, and as foon as the army which liad beficged thefe towns was anle to join the grand army under Pichegru and

The Frunct by the al-

Prench in the neighbourhond of Maefricht. On the 15 th of Revalution September the French attacked the whole Autrian 1-1\%. 208 Further fuscefics of the French, polls in an extent of live laguts from Licge to MiceAtricht. On that and the fillowing day th loffies were nea-ly equal. On the 1 ght the lrench with 50 pieces of cannon attached Genier:al Kiay in his entrenched camp before Macturichr. M. de Kity vas already re-
titing when General Clarfait arrived wih a ilrong reinforcement, and after al fevere combat the lirerich were ence more c mpelled to retire. On the 1 Sth the French renewed the attack with tenfold fury upin every part of the Aultrian linc, and the whole was compelled to fy to the ncighbourhood of Aix-la-Chapelce. Genemal Cluirfatt nuw chote a flrond polition on the banks of the Roer, where he even dieclared it to be his wilh that he might be attacked. But by this time the firit of his army was Jmmbled, defertions became numerous, and the want of dilcipline was cxtreme. On the itt of Ofinber the French croffed the Maefe and the Rner, and attacked the whole Aultriar. pofts from Ruremond down to Juliers. After a bloody engagement, the brave and aftive, though unformate, General Clairfait was compelled hattily to crofs the Rhine, with the lofs of 10 or 12,000 men. The French general did not attempt to crois that river, but one detachment of his army took poficfion of Coblent\%, while others laid clofe fiege to Venlo and Maeftricht, which foon furrendered.

The divifion of the French army, in the mean time, under Gencral Pichegru came down upon Holland, and attacked the allied army under the duke of York between Bois-le-duc and Grave. They forced the advanced poft of Boxtel. Lieutenant-general Abercromby was fent to attempt to recover this poft on the fifteenth of September, but he found the French in fuch force that he was obliged to retreat. Indeed the French were difcovered to be no lefs than 80,000 Atrong in that neighbourhood. The duke of York was unable to contend againft a force fo fuperior, and setired acrofs the Maefe with the lofs of fomewhat lefs than 1500 men. Pichegru immediately laid fiege to Bois-le-duc. On the 3oth of Scptember, Creveccur was taken, and Bois-leduc furrendered in 10 days thereafter. In it 408 French emigrants were taken prifoners; and thefe, as well as 700 that bal been taken at Nieuport, 500 at Sluys, and 1:02,at Valenciemes, wereall put to death, agreeably to the a igorous law formerly made by the convention. The French now followed the duke of York acrofs the Maete. Upon this the greater part of the allied army under his royal highnefs croffed the Rhine and took poit at Arnhcim. The remaining part of the army followed foon after, and Nimeguen was occupied by the French on the 7th of November. The duke of Brunfwick was at this time requefted to take the command of the allied army, to proted Holland, if poffible. He came to Arrbeim for that purpofe; hut after examining the ftate of things there, he declined the undertaking. The allied troops had now fo often fled before their victorious and almoft innumerable enemies, they had fo often been in want of every neceflary, and had been received fo ill hy the inhabitants of the countries through which they faffed, among whom the Fiench caufe was extremely popular, that they had loft that regularity of conduct and difeipline which alone $c_{\text {an }}$ afford a fecure profper of fuccefs in military affairs.

The Frenci, on the eentrasy, well received, abomaling rench in cuery thing, and prom of fighting in a popular caufe, Ke volutich now ated with mu, ha der, and fubmitted on the fridet dicipline. In adduti- n w all thefe advantages, the lirench lemers had the dexterity to pertinade the world that vew and unknown arts were cmploged to give aid to their caufe. At this period the eclesraple was firll wed for convering intell:rence from the frome nflie the capital, and irom the capital to the frontiers. (See mics.
'Thefgraphe). Ba:l mons were alfo uled by the Irench during this campaign to procure knowledge of the poDition of the enemy. An enginect afcendal with the ballonn, which was fuffered to rile to a great height, but prevented from flying awory hy a ionerg cord. Ile made plans of the cnemj's onc:mpment ; and ciuring an attack he fent down notice of every buttile nowement. In the affairs of men, and more clpecially in militaty tranfuatns, opinion is of more importance than tcally. The French Toldiers confided in their own cfficers as men potiefied of a kind of omnifcience, while the allied tronps, no doult, beheld with mxiety a new contrivance employed aga nht th:m, whole importance would be read ly magrified by credulity and ignorance. With all thefe advantages, however, atter the capture of Nimeguen, they once more made a halt in their career, and ibftained from the attack of Holland, Which now feemed almolt proll rate before them.

While thefe events nccurred in the north, the French arms were fearcely lefs fuccefsful on the fide of spain. Bellegarde was taken; in the Weftern Pyrenees, Fon- Epain. tarabia furrendered, and alfo St Scbatian; the whele kingdom of Spain feemed panic llruck. That feeble government, with an almon impregnable frontier, and the, moil powerful furtreifee, could make little refiftance; and the difficult nature of their country was their only protection. The hiftory of this war is only a hifory of victories on the part of the French. In the Eaftern Pyrenees, on the 17 th of Noveraber, the French general Dugommier was killed in an engagement, in which his army was fuccefsful. On the 20th of that month the French again attacked the Spaniards, and reuted them by means of the bayonet, without firing a fingle mufket-1hot. Tents, baggage, and cannon, for an army of 50,000 men, fell into the hand of the conquerors, along with a great part of the province of Navarre, Towards the end of the year, an army of 40,000 Spaniards, entrenched behind 80 redoubts, the labour of lix months, fuffered themfelves to be completely routed; their general count de La Union was found dead on the field of battle, and the whole Spanifh artillery was taken. In three days thereafter, the fort Fermando de Fignieres, containing a garrifon of 9107 men, furrendered, a! though it mounted 171 pieces of cammon, and polfefled abundance of provifions. The French continued their conquelts; Rofas was taken, and the whole province of Catalonia was left at the mercy of the invaders.
The fuccelfes of this wonderful campaign were not yet terminated; and the laft pant of them is perhaps the mof important, although no great effort was necelfary to its enecution. The winter now fet in with uncom. mon feverity. For fome years palt the feafons of Europe had been uncommonly mild; there had been litthe froft in winter, and no intenfe heat in fummer. But during the late feafon the weather had long been rem.rkably

## RE V [ 199$] \quad$ R E V

French markably dry till the latter part of harvelt, when there Revolution fell a confiderable, though by no means unusual, quan1795. city of rain. Towards the end of December a Revere fro bound up the whole of the rivers and lakes of Holland. The Wal was frozen over in the beginning of January ; a circumftance which had not occurred for 14 years pat. Taking advantage of this, the French crolfed that river, and with little oppofition fcized the important pals of Bommell, which at other feifons is to Prong by its inudations. The allied army had been joined by 17,000 Austrians, and had received orders to defend Holland to the lat. They did fo, and were fuccefsful in repulfing the French for forme days between the Waal and the Leek; but the republican army, amounting to $70,000 \mathrm{men}$, having at lat advanced in full force, the allied troops were compelled to retire acrofs the Yliel into Westphalia. In the courfe of their march through this defert country, in the midft of revere from and a deep frow, they are faid to have fuffered incredile hardihips, and to have loft a very great number of men. The French, in the mean time, advanced rapidly acrofs the country to the Zuyder fa, to prevent the inhabitats from flying, and carrying off their property. On the 1 th of January 1795 , a party of horfe, without refinance, took poffeltion of Amiterdam. The other towns furrendered at difcretion. In confequence of an order from the S ares General, the Itrong fortreffes of Bergen-op-zoom, Williamttadt, Breda, \&cc, opened their gates to the French. The fleet and the hipping were fixed by the intenfe frof in their nations, and fell a prey to the enemy; who thus, with little effort, made a complate conqueft of this populous and once powerful coontry. The French were well received by the people at large. The power of the Stadtholder had been fupported among them merely by the influence of Prufia and England. Through hatred to this office, which had now become odious chiefly to the mercantile ariftocracy of Holland, they were little attached to their allies, and give them, during the prelent war, as little fupport as pollible. The Stadtholder and his family now fled to England. The French declared, that they did not mean to make fubjects but allies of the Dutch, and in. sited them to call together popular affemblies for fettling their own government, under the protection of the French republic.

Thus terminated a campaign, the molt aftonifhing perhaps, that has been known in the hiftory of mankind. In the courfe of it, even before the conquer of Hols. land, the French had taken 2000 pieces of cannon and 60,000 prifoners. After that event, the conquered territories added to them a population of nearly $1+$ millions of people. Luxembourg and Monte were the only places on thisffide of the Rhine that relifted them. The former was clofely blockaded, for the purpofe of combelling it to furrender; the latter was feveral times affaulted, but fuccef: fully held out.

Europe was now weary of this bloody Arife. The German Diet of Ratifon declared its refolution to take meafures for procuring peace. The Grand Duke of Tufcany concluded a treaty with the French repubic. France itfelf, exhaufted by malfacres, emigrations and the terrible efforts which it had made, withed for tranquillity; and the Convention found it neceflary to declare that they were willing to treat for peace with any of the powers of Europe, upon honourable terms.

The frequent changes, however, which have with aftonithing rapidity taken place in the mode of conducting French affairs, and the different principles difplayed by the different factions as they fucceflively got into power, had produced in Great Britain and Aultria a very general perfuafion that no peace concluded with the prefent Convention could either be honourable or permanent ; and therefore the fe two mighty nations have refolved to continue the war with redoubled vigour. In fupport of the wifdom of this refolution, it lias been observed, that the hatred of the Mountain to the Gironditts was fuch, that it would have violated any treaty which had been concluded with them; that when

 we had reafon to look for information, and we have confined ourfelves to a dimple narration of facts, feldom giving way to the reflections which they fuggefted. Our facts, too, lave been generally fated from writers who are fuppofed to be not unfriendly to democracy, that they may gain the fuller credit with other reformers ; for in the mon favourable point of view in which thole  .

#### Abstract

 $\square$ facts can be placed, they furmifi firong objections to precipitate innovations in moderate governments. If the horrible deeds of darkness which have been aced on the theatre of France cannot make us contented with the government under which we live, and which has been brought to its present fate of perfection, not by the metaphysical fpeculations of recluse plilofo. phers, but by obfervation and the practical experience of other nations we foal be confidered by polterity as a people

RliYN (Jan de), an cinivert hiftry and portrait painter, bern at Dinlis! in 16to. He bad the grood fortune to be a difighte of Vandyke, was the firtl performer in his fehoul, and wis for at:ached to his ratafeer that he followed him to London, where it is thought ha convinued as long as he lived. In thefe kingdoms he is molly known by the name of Lazers Fan. He died in 1678 : and it is imagined that the ficarcity of his works is necalioned by fo many of them heing imputed to Vandyke; a circumfance which, if true, is beyond any thing that could bo faid in his praife.

REYNOLDS (Sir Jofhua), the celtbrated painter, was, on July the $16 t h, 1 / 23$, born at Plompton, a fmall town in Devonthire. His father was minifter of the parih, and alfo mafter of the grammar ichool; and being a man of learning and philanthropy, he nas beloved and refpected by all to whom he was known. Such a man, it will naturally be fuppofed, was alficuous in the cultivation of the minds of his children, among whom lis fon Joflua Thone confpicuou:, by difplaying at a very early period a fuperiority of genius, and the rudiments of a correct tafte. Unlike other boys, who gencrally content themfelves with givirg a literal explanation of their author, regardlef of his beauties or his faults, young Reynolds attended to both thefe, difplaying a happy knowledge of what he read, and entering with ardour into the fisitit of his author. He difcovered likewife talents for compofition, and a natural propenlity to drawing, in which his friends and intimates thought him qualified to excel. Emulation was a diflinguilhing feature in his mind, which his fasther perceived with the delight natural to a parent; and defigning him for the church, in which he hoped that his talents might raife him to eminerice, he fent lim to one of the univerfities.

Soon after this period the grew palfionately fond of painting; and, by the perufal of Richardion's thenry of that alt, was determined to make it his profeffion through li'e. At his own earneft requeft, therefore, he was removed to London; and about the year 1733 became a pupil to Mr Hudfon, who, though not himfelf an eminent paintcr was preceptor to feveral who afterwards excelled in the ait. One of the firlt advices which he gave to Mr Reynulds was to copy carefally Cucreino's dravings. This was done with fuch tkill,
that many of the copies are faid to le row prefirved in Reyndes. the cabinets of the curious as th: uriginal, of that very great mafter.

About the year $17+9$, Mr Reynolds went to Italy under the auipices, and in the compary, of the late Lord (then Commodore) Keppal, who was appcintal to the command of the Britifl fquadron in the Mediterranean. In this garden of the workl, this magic feat of the a:ts, he failed not to vilit the fibonls of the great mafers, to fludy the productions of different arcs, and to contemplate with unwearied att ntion the various beauties which are characteriftic of each. His labour here, as has been obierved of anneher painter, was "the labour of love, not the tafk of the hireling ;" and how much he proficed by it is known to all Eutrope.

Having remained :bont two years in Italy, and Atudied the langage as well as the arts of the country with great luccefs, he returned to England, improved by travel and refined by education. On the road to London from the port where he landed, he accidentally found in the inn where he lodged Jolnfon's life of Savage; and was fo tahen with the charms of cempofition, and the mafterly deliaeation of character diplayed in that performance, that having begun to read it while leaning with his arm on the chimncy-piece, he continued in that attitude infenfible of pain till he was hardly able to raife his hand to his head. The admiration of the work naturally led him to feek the acquairtance of its anthor, who continued one of his funcercit admirers and warmeft friends, till $1-88_{4}$, when they were feparated by the ftroke of death.

The firft thing that ditinguifhed him after his return to his native country, was a full length portrait of Commedere Keppel; which in the polite circles was fpoken of in terms of the higheft encomium, and teftified to what a degree of eminence he had arrived in his profeffion. This was followed by a portrait of Lord Edgecombe, and a few others, which at once introduced him to the firft bufinefs in portrait painting ; and that branch of the art he cultivated with fuch fuccefs as will for ever eftablifh his fame with all deferiptions of refined fociety. Having painted fome of the firf-rate beauties of the age, the polite world flocked to fee the graces and the charms of his pencil; and he foon became the molt faflionable painter, not only in England, but in all Europe. He has indeed preferved the refemblance of fo many illuftrious characters, that we feel the lefs regret for his having left behind him fo few hitorical paintings; though what he has done in that way fhows (A) him to have been qualified to excel in both departments. The only landfcape, perlaps, which
(A) As the lnvers of painting may wilh to have a catalogue of this great mater's hiftorical pieccs, we fubjoin the following from the Europear. Magazinc, which we have good reafon to believe accurate, as the editors of that mifccllany grudge neither trouble nor expence to procure authentic information. Sir Johua's principal hiforcal pieces, then, are the following: Hope nurfing Love; Venus chattifing Cupid for having, learned, to catt accouns: Ccunt Ugolino in the dungeo ; the calling of Samuel; Atiadne ; a Captain of banditti ; Beeggar Boy; a Lady in the charater of St Arnes; Mhais; Diony ius the Are pareit: ; an intant Jupter ; Muler Crewe in the character of Henry VIIt ; the dealh of Dido; a Child afleep; Cupid flecping; Covent Garden Cupid; Cupid in the Chous; Cupils printing; Boy laughing; Mater Hefert in the character of Bacchus; Hebe ; Mifs Meyer in the charater of llibe; Madona, a head; the Blact-guard Mercury; : little boy (Sa. mucl) prasing; and old difan reading; Love loofing the zone of Beauty; the Childicn in the Wood; Clec-

Regnolits. he ever painted, except thore beautiful and chafte ones which compofe the lack grounds of many of his portraits, is "A View on the Thames from Richmond," which in 1784 was exhibited by the Snciety for Promoting Painting and Defign in Liverpool.

In $176+\mathrm{Mr}$ Reynolds liad the merit of being the firf promoter of that club, which, having long exifted without a name, became at laft diftinguifhed by the appellation of the Lit. rary Club. Upon the foundation of the Rojal Academy of Painting, Sculponre, and Architecture, he wows appointed prefident; and his acknowledged excellence in his profeffion made the ap. pointment acceptable to all the lovers of art. To add to the dignity of this new inflitution, his majefty conferred on the prefident the honcur of knighthood; and Sir Jothua delivered his firft difcourfe at the opening of the Academy on January 2. 1;69. The merit of that difcourfe has been univerfally admitted among paintcrs ; but it contains fome directions refpecting the proper mode of profecuting their fudies, to which every fthdent of every art would do well to pay attention. "I would chiefly recommend (fays he), that an implicit obedience to the rules of art, as eftablifhed by the practice of the great mafters, flould be cxacted from the foung ftudents. That thofe models, which have paffed through the approbation of ages, thould be confidered by them as perfeet and infallible guides; as fubjects for their imitation, not their criLicifm. I am confident, that this is the ouly efficacious method of making a progrefs in the arts; and that he who fets out with doubting, will find life finifhed before he becomes matter of the rudiments. For it may be laid down as a max. im, that he who begins by prefuming on his own fenfe, has ended his ftudies as foon as he has commericed them. Every opportunity, therefore, fhould be taken to difcountenance that falfe and vulgar opinion, that rules are the fetters of genius. They are fetters only to men of no genius; as that armour which, upon the frong, becomes an ornament and a defence, upon the weak and mifhapen turns into a load, and cripples the body which it was macic to protect."

Each fucceeding year, on the diftribution of the prizes, Sir Jofhua delivered to the ftudents a difcourfe of equal merit with this: and perhaps we do not hazard too mucll when we fay, that, from the whole colleßted, the lover of belles lettres and the fine arts will acquire jufter notions of what is meant by tate in general, and better rules for acquiring a correct tatte, than from multitudes of thofe volumes which have been profelfedly written on the fubjea.

In the autumn of 1785 lie went to Bruffels, where Vol. XVI.
he expended about I.. 1000 on the purchafe of paint. Reyustes. inge, which, having been talen from the different monaiteries and religious houfes in Flanders and Germany, were then expefed to fale by the command of the Emperor Jofeph! Gainforough and he had engaged to paint each other's portrait ; and the canvas for both bc-ing aftually ftretched, Sir Johua gave one fitting to his diftinguifhed rival; but, to the regret of every admirer of the art, the unexpected death of the latter prevented all further progrefs.

In 1790 he was anxioully defirous to procure the vacant profefforthip of perfective in the academy for Mr Bonomi, an Italian arclitect ; but that artift not having been yet elected an affociate, was of courfe no academician, and it became neceffary to raife him to those fituations, in order to qualify him for being a proferf $r$. Mr Gilpin being his competitor for the allociatefhip, the numbers on the ballot proved equal, when the prefident by his cafting vote decided the election in favour of his friend, who was thereby advanced fo far towards the frofefforfhip. Soon after this, an academic feat being vacant, Sir Jchua exerted all his influence to olotain it for Mr Bonomi; but finding himfelf outvoted by a majority of two to one, he quitted the chair witl? great difatisfaction, and next day fent to the fecretaly of the academy a formal refignation of the office, which for twenty-one years he had filled with honour to himfelf and his country. His indignation, however, fubfiding, he fuffered himfelf to be prevailed upon to return to the chair, which within a year and a half lie was again defirous to quit for a better reafon.

Finding a difeafe of languor, occafioned by an enlargement of the liver, to which he had for fome time been fubject, increafe upon him, and daily expecting the total lofs of fight, lie wrote a letter to the academy, intimating his intention to refign the office of prefident on account of bodily infirmities, which difabled him from executing the duties of it to his own fatisfaction. The academicians received th:s intelligence with the refpectful concern due to the talems and virtues of their prefident; and either then did enter, or defigned to enter, into a refulution, honourable to all parties, namely, that a deputation from the whole body of the academy thould wait upon him, and inform him of their wifh, that the authority and privileges of the office of prefident might be his during his life; declaring their willingnefs to permit the performance of any of its duties which might be irkfome to him by a deputy.

From this period Sir Jofhua never painted more. The lat effort of his pencil was the portrait of the Honourable Charles James Fox, which was executed in his C c beft
patra difolving the pearl ; Garrick in the charakter of Kitely ; Garrick between Tragedy and Comedy ; Mirs Abingdon in the charater of Comedy; a Child furrounded by Guardian Angels; Mifs Beauclerc in the character of Spenfer's Una; Refignation; the Duchefs of Manchefter in the character of Dianil ; Lady Blake in the character of Juno ; Mrs Sheridan in the charater of St Cecilia; Edwin, from Beattie's Minftel ; the Narivity, Four Cardinal Virtuc., and Faith, Hope, and Clarity, for the window of New College Chapel, Oxford; the Studinus Boy ; a Bacchante ; a daughter of Lord W. Gordon as an Angel ; the Holy Family; the Cottagers, from Thomfon; the Vellal; the Careful Shepherdefs; a Gypfey telling Fortures; the isfant Hercules itrangling the Serpent; the Moufe-trap ginl; Venus; Cornelia and her Chi!dren; the Bird; Mel.ncholy; Mrs Siddons in I'ragedy ; Head of Lear; Mrs Talmath in the claracter of Miranda, with Profpero and Caliban ; Robir Goouflicw; Denth of Cardinel Beaufort; Macbeth, with the Caldron of ihe Witches.

## REY

his other great powers in the ant which he profefed, renamed unabated to the end of his life. When the latl totches wele given to this pistue,
"The hand of Reynolds fell, to rife no more." On Thuriday February the 23 - 1792, the world was defrived of this aminble man and cre:llent attilt at the $x_{2}$ e of 63 years; a man than whrm no one, accordints to Juhnfor, had fatfed through life with more obiervatin of of mand mamners. The following charater of Lime in faid to be the prodnstion of Mr Burke:
" Ifis illnefs was long, but borne with a mild ard chesful fortitude, without the leatt mixture of any thing irritable or qucrulous, agrecably to the placid and even tenor of his whole life. He had from the b.girning of his malady a diftinct view of his difolution, which he contemplated with that entire compofure which nothing but the innocence, integrity, and uf=fulnefs of his life, and an unaffected fubenifion to the will of Providence, could beftow. In this fituation he had every confolation from family tendernefs, which his tendernefs to his family had always morited.
. Sir Jolhua Reynolds was, on very many accounts, ene of the mof memorable men of his time: He was the firt Englifhman who added the praife of the elegrumt arts to the other glories of his comntry. In talte, in grace, in facility, in happy invention, and in the richuefs and harmony of colouring, he was equal to the great matters of the renowned ages. In portrait he went beyond them ; for he comminicated to that defoription of the art in which Englifh artilts are the moit engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even thore who profeded them in a fuperior manner did not always prederve when they delineated individual nature. His portraits remind the fpectator of the invention of hiftory and the amenity of landfcape. In painting portraits, he appears not to be raifed upon that platform, but to defeend to it from a higher fphere. His paintings illuflrate his teflons, and his leffons feem to be derived from his printings.
"He polfeffed the theory as perfeetly as the practice of his art. To be fuch a painter, he was a profound and penetrating philofopher.
"In full happinefs of forcign and domeltic fame, admired by the expert in art, and by the learned in fuience, courted by the grea', carefied by fovereign powers, and celebrated by ditinguilhed poets, his native humility, modefty, and candour, never forfook him even on simprife or provocation ; nor was the leaft degree of arrogance or aftumption vifible to the molt ferutinizing cye in any pat of his condut or difcourfe.
" His talents of every kind-powertul from nature, and mot meanly cultivated in letters-his focial virtues in all the relations and all the habitudes of life, rendered Lim the centre of a very great and unparalleled varicty
of roresabl: fociet:es, which will be diffipated by his death. Halnd too much merit not to excite fome jea. loufy, too mucla insocence to provoke any enmity. The Iffs of no man of his sime can be felt with more fincere, g(naral, and unmixed firrow."

REZAN, or Rezanskor, an ancient :own of Ruffla, and eapital of a duchy of the fime name, with a: archlithop's fee. It was formerly confiderable for its extent and iches; but it was almoftenned by the Tartars in 1568. The cuuntry is populous, and was formerly governed ly its own princes. E. Long. 42.3.0 N. Litt. 54. 54 .

RHADANANTHUS, a fevere judge, and king of Lydia; the poets make him one ef the three judges ot hell.

RHAGADES, in medicine, denotes claps or cleits in any part of the bods. If feated in the anms, and recent, the paticut mult fit ftill, and fit over the Iteam of warm water. The epulotic cerate may allo be applied. If the lips of thefe fiffures are callous, they mult be cut or otherwife treated as to become new ulecrations.

RHAMA, or Rama, an incarnate deity of the firft rank, in Indian mythology. Sir William Jones helieres he was the Dionyfos (a) f the Greeks, whom they named Bromius, without knowing why; and Bugenes, when they reprefented him hormed, as well as Lyaios and Electtherios tine deliverer, and Triamlos or Dytbyrambos the triumphani. "Ioft of thofe titles (fuys Sir William) were Afaatic Re adopted by the Romans, hy whom he was called Bruma, fearches, Tawiformis, Lilier, and Triumphus; and both nations had vol. i. records or traditionary accounts of his giving law's to $\mathrm{P}, 22 \mathrm{r}, \mathrm{\&}=$. men and deciding their cortefts, of his improring navigation and commerce, and, what may appear yet more obfervable, of his conquering India and other countries with an ariny of fatyrs, commanded by no lefs a perfonage than Pan; whom Lillius Giraldus, on what authority I know nict, aflests to have refided in Iberia' when he had returned, fays the learned mythologin, from the Indian war, in which he accompanied Bacehus.' It were fuperfluous in a mere eflay to rmany lengh in the parallel between this European god and the fovereign of Ayodlya, whom the Hindoos believe to have been an appearance on earth of the preferving power; to have been a conqueror of the highelt renown, and the deliverer of nations from tyrants, as well as of his confort Sita from the giant Ravan king of Lanca; and to have commanded in chief a numerous and intrepid race of thofe large monkeys, which our naturalifts, or fome of them, have denominated Indian fatyrs: his general, the prince of faiyrs, was named Hanumat, or "witl) high cheek bones;" and, with workmen of fuel? agility, lee foon raifed a bridge of rocks over the fea, part of which, fay the Hindoos, yct remain ; and it is probable the feries of rocks to which the Mulfulmans or the Portuguefe have given the foolith name of $A$ dam's (it fhould be called Ramia's) bridge. Night not this army
(A) The learned prefident, whofe death will be lamented by every felolar, by the orientalift and the divine e\{pecially, imagines, that this would lully appear from comparing tugether the Diomfaca of Nonus and the Ramayar of Vilmic, the firlt pret of the Hindoos. He adds, that, in his opinion, Rhama was the fon of Cuth, ind that he might have eitablithed the firf regular government in that pat of A fia, in which his exploits arc taid to have been performed.

Rhansa, army of fatyrs have been only a race of mountaineers, $\underbrace{\text { Rhamnus. whom Rama, if fuch a monarch ever exifted, had civi- }}$ lized? However that may be, the large breed of Indian apes is at this moment held in high vencration by the Hindoos, and fed with devotion by the Brahmans, who feem in two or three places on the banks of the Ganges to have a regular endowment for the fupport of them : they live in tribes of threc or four hundred, are wonderfully gentie (I fpak as an eye-witnefs), and appear to have fome kind of order and fubordination in their little fylvan polity." The feltival of Rhama is held on the 9th day of the new moon of Chaitra, on which the war of Lauca is dramatically reprefenteci, concluding with an cxhibition of the ficry ordeal, by which the vistor's wife Sita gave proof of her connubial fidelity. Among the Hindoos there are a variety of very fine dramas of great antiquity on the flory of Rham:.

There are three Rhamas mentioned in the Indian mythology, who, together with Crifhna, the darling god of the Indian women, are defcribed as youths of perfes beanty. The third Rlama is Crinna's elder brother, and is confidered as the eighth Avatar (B), invelted with an emanation of his divine radiance. Like all the Avatars, Rhama is painted with gemmed Echiopian or Parthian coronets; with rays encircling his head, jewels in his cars, two necklaces, one ftraight, and one pendant on his bofom, with dropping gems ; garlands of well-difpofed many-coloured flowers, or collars of pearls, langing down below his waitt; loofe mantles of golden tiffue or dyed filk, embroidered on the hems with flowers elegantly thrown over one fhoulder, and folded like ribbands acrofs the breaft; with bracelets, two on one arm and on each wria: all the Avatars are naked to the waits, and uniformly with dark azure flelh, in allufion probably to the tint of that primordial fluid on which Narayan moved in the beginning of time; but their diirts are bright yellow, the colour of the curions pericarpium in the centre of the water-lily.

RHAMNUS, the buckthorn, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 43 dorder, Dumofic. The calyx is tubulous, with five minute feales furrounding the ltamina; there is no corolla; the fruit is a berry. There are 27 fpecies; of which the molt remarkable are,

1. The catharticus, or common purging buckthorn, growing naturally in fome parts of Britain. This grow's to the height of 12 or 14 feet, with many irregular branches at the extremities. The leaves are ovallanceolate, finely ferrated on the edges, their nerves converging together. The flowers grow in clufters, one on eacli footftalk, white, and in this fpecies divided into four fegments : the fruit is a round black berry, containing four feeds. The juice of the berries is a

Atrong purgative, and is made ufe of for making the Rramnus. common fyrup of buckthorn kept in the flops. The bark is emetic: the juice of the unsipe berries with alum dyes yellow, of the ripe ones a fine green; the bark alfo dyes yellow. The green colour yielded by the berries, called by the French verdkereffe, is much eneemed by miniature painters.

Of this fpecies there are two varieties, riz. the dwat 1 buckthorn, a flirub of about a yard high, of a greenifh colour but little fhow; and the long-leaved dwaif buckthorn, which is a larger flarub, with leaves fomewhat larger, but in other refpects very fimilar to the dwarf buckthorn.
2. The zizyphus is the fpecies in which the lac infect * forms its cells, and produces the wax called ${ }^{3} \mathrm{zm} 2$. lac. See Lacca.
3. The lotus has the leaves, prickles, flowers, and fruit, of the zizyphus or jubeb; only with this cifference, that the fruit is here round, fmaller, and more lufcious, and at the fame time the branches, like thore of the paliurus, are neither fo much jointed nor crooked. The fruit is in great repute, taftes fomething like gingerbread, and is fold in the markets all over the fouthern diltricts of Great Britain. The Arabs call it aneb enta el feedra, or the jubeb of the feedra; which Olavus Celfus had fo high an opinion of, that he has defcribed it as the dudaim of the fcriptures. This fpecies is very common in the Jereede and other parts of Bonbay; and has been fuppofed by fome to be the fame plant with that celebrated by Homer for its enchanting property; though the latter is more generally fuppored to have been a fpecies of Diospyros (which fee). It is proper, however, to diftinguifh between both thefe fhrubs and an herb often mentioned by the ancients under the name of lotus, which Homer mentions as being fed upon by the horfes of Achilles, and Virgil as proper to increafe the milk of heep (fee Lorus). They are alfo different from the Egyptian lotus defcribed by Herodotus; for which fee Nym-

4. The frangula, or berry-bearing alder, is a deciduous fhrub, a native of Englind and molt of the northern parts of Europe, and affords feveral rarieties.
5. The Alpine, rough-leaved frangula, or berry: bearing alder, is alfo a deciduous hrub, and native of the Alps. It differs in no refpect from the common fort, except that it has no thorns, and that it will grow to be rather taller, with tongh, large, and doubly laciniated leaves. The fmooth-leaved alpine frangula is a variety of this fpecies, with fmooth leaves and of a luwer growth.
6. The paliurus, or thorn of Chrif, is a deciduous flrub or tree, a native of Paleftinc, Spain, Portugal, and Italy. It will grow to nearly the height of 14

C c 2
feet,
(E) Aoutar means the defcent of the deity in his capacity of preferver. The three firlt of thefe defcents relate to fome ftupendous convulfion of our globe from the fountains of the deep, and the fourth exhibits the miraculous punifhment of pride and impiety, appearing to refer to the delage. Three of the otherswere ordained for the overthrow of tyrants or giants. Of thefe Avatars we have mentioned in the text, that Rhama is the cighth; Budlla, who appears to have been a reformer of the dodrines contancd in Vedas, is the ninth: the tenth Avatar, we are told, is yet to come, and is espected to appear mounted (like the crowned conqueror in the Apocalypfe) on a white horfe, with a fcimeter blazing like a comet to mow down all incorrigible and impenitent offenders whe fhall then be on the earth.

F: ${ }^{2}$ nonas, feet, and is armed with farp thorns, two of which are
Atraight, and upright; the other is fearcely half that
length, and bent backward; and between then is the bud for next year's fhoot. June is the time of flowerin? and the fowers are fuccieded by a fmall frnit, furraunded by a membrane. "Tli, plint (fiys Hanbury) is undoubedly the firt of which the crown of thorns for our Bleffed Sasiour was conypofed. The branches are very plime, and the fpine clit are at every joint floons and tharp. It grows natually about Jerualem, as well as in many paits of Judza; and there is no doubt that the barbarous Jews would make choice of it for their cruel purpole. But what farther confirms the truth of thefe thorns being then ufed, are the ancient pitures of our Bleffed Savion's crucifixion. The thorns of the crown on his head exantly anfwer to thofe of this tree; and there is great reafon to fuppofe thefe were taken from the carlielt paintiugs of the Lord of Life: and ceen now our modern painters copy from them, and reprefent the crown as compofed of theic thorns. Thafe plants, therefore, thould principally have a thare in thofe parts of the plantation that are more peculiarly defigned for religious retirement; for they will prove excellent monitors, and conduce to due reflection on and gratitude to "Him who hath loved us, and has walhed us from our fins," \&E.
7. The common alaternus is an evergreen tree, and native of the fouth of Europe. There are feveral vazieties of this fpecies; the moft remarkable of which are the broad-leaved and the jagged-leaved alaternus, which have all been confounded with the phillyrea.
8. The infectorius, or narrow-leaved buckthorn, is an evergreen fhrub or tree, and native of Spain. It grows to the height of 10 or 12 feet, and fends forth leveral branches from the bottom to the top. They are covered with a blackifh or dark-coloured bark, and each of them is terminated by a long flarp thorn. The fruit continues on the trees all winter, making a beautiful appearance among the narrow-ciuflered leaves at that fesfon.
9. The oleoides, or olive-leaved buck thorn, is an ever\#reen fhrnb, and native of Spain, and grows to the Bi.ight of 8 or 10 feet. It fends forth numel ous branches, each of which is terminated by a long flarp fine. The llow rs are fmall, of a whitih green colour, and are fuccoeled by round blak berries.

RHANIPHASTOS, in ornithology, a genus belonging to the crder of pice. The bill is rery large, and ferrated outwardly. The noftrils are fituated belind the bafe of the beak; and in moll of the fpecies the feet are toed, and placed two forwards and two Lackwards. The tonguc is loug, norrow, and feathere.l on the edres. Mr Latham enunierates 15 different tpecies; of vhich the toucans are the moft remarkable, and were furmerly divided into four or five varicties, though Mr Latham makes them dittint fpecies, of which we thall only deferibe that called the ied beaked tulucan.
Hate
cecaxvys: milar thape, with a large luad to fupport its monllous bill: this bill, from the angles of the month to its point, is fix inches and an half: and its breadth in the tbicker part is a litte more than two. lis thickacfs
near the head is one inch an! a quanter ; and it is a little roundad along the top of the upper chap, the under lide being round alfo; the while of the bill extremely llight, and a little thicker than parehment. The upper chap is of a briglte yellow, except on each fide, which is of a fine fcatlet col ur; as is alfo the lower chap, execpt at the barie, which is purple. Between the head and the bill there is a black line of feparatien all round the tate of the bill ; in the upper part of which the nof::ils are placed, and are almoft covered with ferthers; which has ocrafioned fome writers to fay that the toucan has no moftrils. Round the eyes, on each fide of the head, is a fpace of bluift fkin, void of feathers; above which the head is black, except a white fput on each fide joined to the bafe of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under fide of the head, throat, and the becrinning of the breath, are white. Between the white on the breaft, and the black on the belly, is a fpace of red feathers, in the form of a new moon, with its horns upwards. The lege, feet, and claws, are of an ath colour; and the tnes ftand like thofe of parrots, two before and two behind.

It is reported by travellers, that this bird, though furnified with fo formidable a beak, is harnulefs and gentle, being fo ealily made tame as to fit and hatech its young in houfes. It feeds chiefly upon pepper, which it devours very grectily, gorging itfelf in fuch a manner that it voids it crude and unconconed. This, however, is no objection to the natires from ufing it again: they even prefer it before that pepper which is frefl gathered from the tree; and feem perfiaded that the ftrength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhaulted.

Whatever be the truth of this report, nothing is more certain than that the tnucan lives only upon a vegetable ditt; and, in a domelic flate, to which it is frequently brought in the warm countries where it is bred, it is feen to prefer fuch fool to all other. Pozzo, who bred one tame, alterts, that it leaped up and down, wagged the tail, and cried with i voicc refembling that of a maspic. It fed upon the fame things that parrois do ; but was molt greedy of grapes, which, being plucked off one by one, and thrown in the air, it would molt dexteronlly catch before they fell. to the gromd. lis trill, he adds, was hollow, and upon that account very light, fo that it lad but littla frength ial fo apparently iormidable a weapon; ner could it peck or thike fuantly therewith. But its t ngue feemed to alfift the efmints of this unveicldy marchine: it was long, than, and llat, not unlike one of the feathers on the neek of a dunginll cock; this it moved up and down, and often extended five or lix inches from the bill. It was of a feff colour, and remarkably fringed on each fide with very imall filaments exally refenbling a feather.

It is probabie that this long tongue has greater Arength than the thin hollove beak that enntains it. It is likely thit the beak is only a kind of theath for this peculiar infrument, ufed by the toucan, not only in macing itella nef, but al o in obtaning its provilim. Nothing is more certain, than that this bird bailds its ne? in holes of trees, which have been - eevioully

## K H A

Rrapis viouliy fcooped out for this purpofe; and it is not very
likely that fo feeble a bill could be very ferviceable in working upon fuch hard materials.

Be tais as it will, there is no bird fecures its yroung better from external injury than the toucan. It has not only birds, men, and ferpents, to guard againft; but a numerous tribe of monkeys, fill more prying, mifchizvou:, and hungry, than all the reft. The toucan, however, fcoops out is nef into the hollow of fome uee, leaving only a hole large enough to go in and out at. There it lits, with its great beak, guarding the entrance; and if the monkey ventures to offer a vifit of curi fity, the toucan gives him fuch a welcome, that be prefently thinks proper to pack off, and is glad to efcape with fafety.

This bird is only found in the warm climates of South America, where it is in great requeft, both for the delicacy of its fleth, which is tender and nourifhing, and for the beauty of its plumage, particularly the feathers of the breaft. The 1 kin of this part the Indians pluck off, and when dry glue to their cheeks; and this they confider as an irrefiftible addition to their beauty.

RHAPIS, in botany: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the firt order, Palme. The calyx is a monophyllous trifid fpatha; the corolla monopetalous and irifid. There are two fpecies, viz. 1. Flabilliformis, or ground-ratan, a native of Cbina; 2. Arundinacea, fimple leaved rhapis, a native of Carolina.

RHAPSODI, Rhafsodists, in antiquity, perfons who made a bufinefs of finging pieces of Homer's poems. Cuper informs us, that the Rlapfodi were cluthed in red when they fung the Iliad, and in blue when they fung the Odylfey. They performed on the theatres, and fumetimes ftrove for prizes in contefts of paetry, finging, Sc. After the two antagonifts had finithed their parts, the two pieces or papers they were written in were joined together again: whence the name, viz. from pzoru, fino, and won canticum: but there feem to have been other Rhapfodi of more antiquity than there people, who compofed heroic poems or fongs in praife of heroes and great men, and fung their own compofitions from town to town for a livelihond; of which profeftion Homer himfelf is faid to have been. See Bard

RHAPSODOMANCY, an ancient kind of divination performed by pitching on a paffage of a poet at hazard, and reckoning on it as a prediction of what was to come to pafs. There were various ways of practifing this rhapfodomancy. Sumetimes they wrote feveral papers or fentences of a poet on fo many pieces of wood, paper, or the like, hlook them together in an u:n, and drew out one which was accounted the lot: fometimes they cait dice on a table whereon verfes were written, and that whereon the die lodged contained the prediction. A third manner was by opening a book, and pitching on fome verfe at firft fight. This method they particularly called the fortes Prenefine; and afterwards, accerding to the poet, made ule of, fortes Howieriva, fortes Fifgifinie, \&c. See Sortes.

RHAPSODY, in antiquity, a difcourfe in verfe fung or rehearfet by a rhapfoditt. Others will have rhapfedy to fignify a collection of verfes, efpecially
thofe of Honcr, which having been a long time difperfed in pieces and fragments, were at length by lififtratus's order digefted into books called rha fades, from patro fui and edo canticum. Hence, anoorig muderns, rhapfody is alfo nfed for an affemb:age of prafidges, thonghts, and authoritics, raked engether irom divers authers, to compofe fome new piece.

RHE, or Ree, a little iflind in the B:ay of Difeay, near the coant of Aunis in France. It was taten during the war with France which ended in 1763 , in the expedition commanded by Huke aid Mordaurit.

RHEA americana. The Ar:erican oftrich of allthors has been frequently menti ned, but tiil of late years very imperfectly known; being blended by fome with other genera, althourh forming of itfelf a ditinet one, difering in many things from all others. The older writers, however, have hept it feparate. It does not occur to us whether any author hias figured this bird except Nieremberg, whofe reprelentation ennveys no juft idea, which is wonderful, as is to be met with in fufficient plenty in various parts of South America; nor has the bird itfelf made its appearance in the cabinets of collectors, until the one now in the Leverian mufeum.
M. Bajon, in his Mem. fur Cayenne, gives a figure and defcription of the jabirus, and feems clear that this bird is no other than the oftrich of America. From this affertion, Mr Latham, in his Synopfis, leaves the matier undecided; but this author, in his Irdex Orm:th.ol. from having met with the fpecimen above aliuded to, and fupported in an account of its manners given by Molina in his Hifl. Nat. dis Chill, treats this matter on more certain grounds, io as to enable us to give the following defcription.

In fize the American oftrich is very little inferior to the common one : the bill is floped not untlike that of a goole, being flat on the top and rounded at the end: the eyes are black, and the lids furnifhed wi:h hairs: the head is rounded, and covered with downy feathers: the neck is two feet eight inches long, and feathered alfo: from the tip of one wing to that of the othe: extended, the length is eight feet; but from the rant of continuity of the webs of the feathers, and their laxityof texture, the bird is unable to raife itfelf from the ground ; it is, however, capable of greatly affiting itfelf by their motion in running, which it does very fwiftly : the legs are ftont, bare of feathers above the knees, and furnifhed with three toes, all placed forwards, each having a ftraight and fout claw as in the calfowary ; on the heel is a callons knob, ferving in place of a back toe: the general colour of plumarge is dull grey mixed with white, inclining to the latter on the under parts : the tail is very fhort, and not confpicuous, being entirely covered with lung loofe and Hoating feathers, having origin from the lower p.rt of the back and rump, and entirely covering it : the bill and legs are brown.

Molina oblerves that this bird varies; the bedy in fome being white, in others black. In refpect to manners, it is faid to be a general feeder, but more fond of flies, which it catches with great dexterity, and will alfo, like the common oftrich, fwailow bits of iron and any other trath offered to $i t$. In commen with the oftrich ol the old world, it lays a number of egrs, from 40 to 60 , in the fand, each of them hoiding a quart;

Rhe,
k.

Rheecia but it differs from that bird in many particulars, efpecially in wanting the callofity on the fermum, and fpars on the wing. With thefe latt the common oftrich is known to defend itfelf: in defet of them, the one here treated of ufes the feet with fuch addrefs as th become at once a furious and dingerous antag nift. The tomale calls its young ones tugether with a hind of whittling note fomewhat fimilar to that of a man: when young it is very tame, frequently following the firft creature ir meets wi:lh. 'The fleth of this bird is filid to be very unpalatable. It is found in vatious parts of South America, from Patagonia to Guiana, and is known by the name of Chsique. We are happy to be able to prefent our readers with an accurate drawing of the bird. See Plate CCCCXXXVII.

RHEFDIA, in botany: A genus of the monogynia order, belonging to the polyandsia clafs of plants; and in the natural method ranking with thofe of which the order is dublful. The corolla is tetrapetalous; there is no calys ; and the fruit is a trifpermous berry.

RHEGIUM (anc. geog.), fo very ancient a city as to be fuppofed to take its name from the violent burfting of the coaft of Italy from Sicily; thought to have been formerly conjoined (Mela, Virgil). A city of the Brutiii, a colony of Chalcidians from Eubcea: a ftrong barrier oppofed to Sicily (Strabo); mentioned b, Luke; furnamed yulium (Ptolemy), from a freth fupply of inhabitants fent thither by Auguftus, after driving Sextus Pompeius out of Sicily (Strabo); and thus was in part a colony, retaining ftill the right of a municipium (Infeription). The city is now called Regy:o, in the Farther Calabria.

RHEIMS, a eity of France in Champagne, and capital of Rhemois. It is one of the moft ancient, celebrated, and largef places in the republic, had an archibilhop's fee, whofe archbilhop was duke and peer of France. It is ahout four miles in circumference, and contains feveral fine 〔quares, well-built hontes, and magnificent churches. It had a mir.t, an univerfity, and five abbeys, the moft fanmous of which was that of St Remy. There are alfo feveral triumphal arches and other monuments of the Romans. It is feated on the river Vefie, on a plain furrounded by hills, which produce excellent winc. E. Long. 4. S. N. Lat. 49. 14.

RHENISH wisk, that produced on the hills about Rheims. This wine, is much ufed in medicine as a bolvent of ircn, for which it is well calculated on account of its acidity. Dr Percival obferves, that it is the beff folvent of the Peruvian bark; in which, however, he thinks its acility has no thate, becaufe an addition of vinegar to water does not augment its folvent 1 ower.

RHETORES, amrngft the Athenians, were ten in number, clefed by lot to plead public caufes in the fenate-houfe or affenbly. For every caufe in which they were retained, they reccived a drachm out of the public mones. They were fometimes called Eursopor, and their fee ro Eurnopmer. No man was admitied to this office before he was 40 years of age, though others lay 30 . Valour in war, piety to their parents, prudence in their affairs, frugality, and temperanee, were neceffiry qu difications for this oflice, and every cardidate underwent an examination concerning thefe virzues previous to the elcation. The orators at Ronie
were not unlile tine Athenian rhetores. See Oza-Rhetorians roz.

RHETORIANS, a fect of hereties in Egypt, fo Rheum. denominated from Rl:etorins their leader. The diftinguifliad tenets of this herefiarch, as reprefented by Plilaftrins, was, that he approved of all the herefies bef re him, and trught that they were all in the right.

RIIFTORIC, the art of five:aking copionfy on any fubject, with all the advantages of beauty and force. Sce Or.itory.

RHCUM, a thin ferous humor, cecafionally oczing out of the glands about the mouth and throat.

Rheum, Rbubarb: A genus of the monogynia order, belonging to the enneandria clafs of plants; and in the natural methot ranking under the 12 th orter, Holoracr.s. There is no calys; the corollat is fexfid and perlifent; and there is one triquetrous feed. There are five fpecies, viz. 3. The thaponticum, or common rhubarb, hath a large, thick, fefly, branching, decplyfriking root, yellowifh within; crowned by very large, roundilh, heart-haped fmooth leaves, on thick, lightlyfurrowed foot-Ralks: and an upright flrong ftem, two or three feet high, adorned with leaves fingly, and terminated by thick clofe fpikes of white flowers. It grows in Thrace and Scythia, but has been long in the Englifh gardens. Its root affords a gentle purge. It is however of inferior quality to fome of the following furts; but the plant being aftringent, its young falks in fpring, being cut and peeled, are ufed for tarts. 2. The palmatum, palmated-leaved true Chinefe rhubarb, hath a thick flefly root, yellow within ; crowned with very large palmated leaves, being deeply divided into acuminated fegments, expanded like an open hand ; upright ftems, five or fix feet high or more, terminated by large fpikes of flowers ". This is now pro- * See Botaved to be the true foreign rlubbarb, the purgative quan-ny, p. 439 . lity of which is well known. 3. The compactum, or and Plate Tartarian rhubarb, hath a large, fllhy, branched root, yellow within; crowned by very large, heart fhaped fomewhat lobated, fharply indented, finooth leaves, and an upright large fen, five or fix feet high, garnifhed with leaves fingly, and brauching above; having all the branches terminated by nodding panicles of white fowers. This has been fuppofed to be the true rhubarb; which, however, though of fuperior quality to fome forts, is accounted inferior to the rheum palmatum. 4. The undulatum, undulated, or waved-leaved Clinefe rlubarb, hath a thick, branchy, deep-ftriking root, sellow within; crowned with large, oblong, undulate, fomewhat hairy leaves, having equal foot falks, and an upright firm ftem, four feet high; garnifhed with leaves fingly, and terminated by long loofe fikes of white flowers. 5. The Arabian ribes, or currant rhub:ub of Mount Libanus, hath a thick fefhy root, very broad leaves, full of granulated protubcrances, and with equal foct-ftalks, and upright firm fems, three or four feet high, terminated by lpikes of flowers, fucceeded by berry-like feeds, being furrounded by a paple pulp. All thefe plants are percinial in oot, and the leaves and Atall:s are :mnual. The roots heing thick, flofhy, gencrally divided, frike decp into the ground; of a browaifh colour without and yellow wihin: the leaves rife in the frring, gencrally come up in a large head fulded t. c gecher,

Rheum.
together, gradually expanding themfelves, having thick foot-Ralks; and grow from one to two feet high, or more, in length and breadth, fpreading all round: amidit them rife the flower-ftems, which are garnifhed at each juint by one leaf, and are of frong and expeditious rowth, attaining their full height in June, when they flower; and are fucceeded by large triangular feeds, ripening in Auguft. Some plants of each fort merit culture in gardens for variety; they will effect a fingulasity with their luxuriant foliage, fpikes, and flowers: and as medical plants, they demand culture both for private and public ufc.

They are generally propagated by feeds fowed in autumn foon after they are ripe, or early in the fpring, in any open bed of light deep earth ; remarking, thote intended for medical ufe fhould generally be fowed where they are to remain, that the roots, being not difturbed by removal, may grow large. Scatter the feeds thinly, either by broad-caft all over the furface, and raked well in ; or in fhallow drills a foot and half diftance, covering them near an inch deep. The plants will rife in the fipring, but not flower till the fecond or third year: when they, however, are come up two or three inches high, thin them to eight or ten inches, and clear out all weeds; though thofe defigned always to fand fhould afterwards he hoed out to a foot and a half or two feet diftance : obferving, if any are required for the pleafure ground, \&c. for variety, they flould be tranfplanted where they are to remain in autum, when their leares decay, or early in fpring, before they fhoot the others remaining where fowed, muft have the ground kept clean between them; and in autumn, when the leaves and falks decay, cut then down, and flightly dig the ground between the rows of plants, repeating the fame work cvcry year. The roots remaining, they increafe in fize annually : and in the fecond or third year many of them will floot up falks, flower, and perfect feeds; and in three or four years the roots will be arrived to a large fize; though older roots are generally preferable for medical ufe.

In Mr Bell's Trave!s we have an account of fome curious particulars relating to the culture of rhubarb. He teils us, that the beft rhubarb grows in that part of Eaftern Tartary called Morgalia, which now ferves as at boundary between Ruffia and China. The marmots contribute greatly to the culture of the rhubarb. Thercver you fee 10 or 20 plants growing, you are furc of finding leveral burrows under the fhades of their broad-fpreading leaves. Perhaps they may fometimes eat the leaves and routs of this plant; however, it is probable the manure they leave about the roots contributes not a little to its increafe; and their cafting up the earth, makes it hoot out young buds, and mul. tiply. This plant does not run, and fpread itfelf, like docks and uthers of the fame ipecies; but grows in tuft:, at uncertain diftances, as if the feeds had been dropped with defign. It appears that the Mongals never accounted it worth cultivating; but that the world is obliged to the marmots for the quant:ties fcatte.ed, at random, in many parts of this country: for whatever part of the ripe feed happens to be blown anoong the thick grafs, can very feldom reach the ground but mult there wither and die; whereas, frould it fall among the loofe earth thrown up by
the marmots, it immediately takes root, and produces a new plant.
After difging and gathering the rhubarb, the Mongals cut the large rons into fmall pieces, in order to make them dry more readily. In the niddle of every piece they foop a hole, through which a cord is drawn, in order to fufpend them in any convenient place. They hang them for the moft part about their tents, and fometimes on the horns of their fheep. This is a molt pernicious cuftom, as it deftroys fome of the heft pars of the root : for all about the hole is rotten and ufelefs; whereas, were people rightly informed how to dig and dry this plant, there would not be one pound of refufe in an hundred; which would fave a great deal of trouble and expence, that much diminifh the profits on this commodity. At prefent, the dealers in this article think thefe improvements not worthy of their attention, as their gains are more confiderible on this than on any other branch of trade. Perhaps the government may hereafter think it pruper to make fome regulations with regard to this matter.

Two forts of rhubarb are met with in the fhops. The firft is imported from Turkey and Ruflia, in roundifl pieces freed from the bark, with a hole through the middle of each : they are externally of a yellowifh colour, and on cutting appear variegated wih lively reddifh Areaks. The other, which is lefs efteemed, comes immediately from the Eaft Indies, in longifh pieces, harder, heavier, and more compact than the foregoing. The firft fort, unlefs kept very dry, is apt to grow monldy and worm-eaten; the fecond is le's fubject to thefe inconveniences. Some of the more induftrious artifts are faid to fill up the worm-holes with certain mistures, and to colour the outfide of the damaged pieces with powder of the finer forts of rhubarb, and fometimes with cheaper materials : this is often fo nicely done, as effectually to impofe upon the buyer, unlefs he very carefully examines each piece. The marks of good rhubarb are, that it be firm and folid, but not finty; that it be eafily pulverifable, and appear, when powdered, of a fine bright yellow colour ; that, upon being chewed, it impars to the fpitte a faffron tinge, without proving flimy or mucilaginous in the mouth. Its tafle is fubacrid, bitterifh, and fomewhat aftringent ; the fmell lightly aromatic.

Rhubarblis a mild cathartic, which operates without violence or irritation, and may be given with fafety cven to pregnant women and children. Befides its purgative quality, it is celebrated for an aftringent one, by which it ferengthens the tone of the fomach and inteftines, and proves ufeful in diarrhoeas and diforders proceeding frum a laxity of the fibres. Rhubarb in fubfance operates more powerfully as a cathartic than any of the preparations of it. Watery tinctures purge more than the fpirituous ones; whilt the latter contain in greater perfection the aromatic, aftringent, and corroborating virtues of the rhubarb. The dofe, when intended as a purgative, is from a feruple to a dram or more.

The Turkey rhubarb is, among us, univerfally preferred to the Eaft India fort, though this laft is for fome purpofes at leaft equal to the other; it is manifeftly mose aftringent, but has fomewhat lefs oi an aromatic flavour. Tinctures drawn from both with reatified fitit have nearly the fame tatte : on diftilling
©f the menfiruum，the extran lift fion the tinfure if the Eaft India thubart）proved conliderably the ftrongelt．

Rhabart has been cultiv．ned of hate in Britain with confiderable fieccefe，and for metl cal purpotis is found to equal that of fircign growth，as is proved by the Trambations of the Landon Society for eleouraging Asts，Mantindures，and Commerce，who have seward－ cil eiveral prii ns buth fur cultivating and curing it In the Tra：ifutions for $1: 02$ ，the gold nedal was
 in the gear 1プ，Mpwards of $3-0$ plinnts of the true 2abarb ir rheum palmatum of the Lendon Pharma－ copocis 1 fis，which in the fecond and hind weeks of Oét ber were tranplinted into a diep loam，it four tect ditance from cach oiter，according to rules laid down by the locetig．In 1793 it wats judiged to Mr Thomas Jones，irem whofe papers we dirive the follow－ in $\begin{aligned} \text { int．} & \text { ormation．}\end{aligned}$

Atrer giving an accurate accomnt of his experiments and chervations，he ecocludes，that the feafon for fow－ ing is the fpring abou：March or April，or in autumn about Auguft and Scpember；that thote plants which are rafed in the fing thould be trat flanted in autumn， and vie er r .3 ；that they cannot have too much room ； that ro．on and time are elfentially necelfary to their be－ ing large，of a good appearance，and perhaps to the in－ ereafe if their purgative qualities；that to effeet thefe furpofes，the fil mult be light，loamy，and rich，but not too mach fo，left ：le roots fhould be too fibrous； that their fituation can icarcely be too dry，as more evils are to be cxpe？ed from a fuperabundan cy of moi－ Aure than any actual want of it：and lally，we may coachude，that in particular the injuries which they are dubject to are principally during their infancy，and to be in puted to infects and ibattention to tbe planting feafon；atierwards，from too griat an expofure to froft： but that nome can be dreaded from heat；ard that in gencrul they are hatdy and cafy of cultivation，when ar－ rived ，eyonis a certain term．

The method of curing thubarb，as propefed by Dr Tirruogel．f Stocklolm，is as fullows：＂Nu routs fhould be taken up ti．l they have been planted ten years：they thould be taken out of the ground either in winter，be－ fure the fiolf fets in，or in the begiuning of fpring，and immedrately cut into pieces，and curefully barked；let them be pipend uprn a table for thrce or four days，and be frequently turned，that the juices may thicken or custente within the roots．After this procefs，make a iole in cach piece，and put a thread through it；by wich lat them hang feparately，either within doors， or in tome theitered flaty thed．Some perfons dry thenin in a diftiren：way：they inclofe the roots in clay， an I make a b．ole in the clay，sbout the thicknefs of a $\therefore$ o！e quill，and in this manner hang up each piece to Chy ieparates，that the moillure may not craporate， nir the itrengeth of the ront be wealiened．Ihut the recthous which the Tartars foll．w is a bad one：they We：the ries cat of the deferts where they grow，bati： t．cra，and immodi．．tely furg them，ard hang them te und ha aceks f their camels，that they nay dry as t：Y U．ivel ：hat this gratly lefens the medicinal virtue © ：！＂rro．＂
：Ar＇H．mans Halley of Pentefrât is Yorknire，to v．．．cm ti： Loxisn Suciety viead the filver medal in

1793，informs us，that his father tried vaitous experi－ ments fir curing thubab，as walhing，beufhing，bark－ ing，and pecting，and he dried them in the fun，on a him，in a thove，or in a warm kitchen．But of the fuc． ce！＇s of all or either of the methods we have no ae－ count，owing to the death of Mir Fialley＇s father．If fent，however，to them，nive different fpecimens，which the Society acknowledges to be fuperior to any rhabarb hitherto cured in Enghand，and produced to then．＇Tl：e rocts fent，Mr Fialley days，were planted about the year 1781 in a light fandyith foil，but were much na－ glected．They were taken up in the fpring of 1792 ， and being thoroughly divelted of the adhemng carth， were placed for dome wecks on the floor of a crol ware－ houfe：the fibres were then taken off，cut up，and dried on the flue of a green－houle；but，from mifinanage－ ment，were entirely foiled．Thre prime rots were fevered in fmall picces，peeled clean，and thoroughly cleared of every particle of unfounduefs．Pant was feparately laid in fieves，and the romainder perforated， Atrung，and fufpended in feftons from the cieling of a warm kitchen．The manner of drefing confifts in pa－ sing off the external coat with a tharp knie，as thin and clean as ponible，and then fimithing it off by a picce of fill－i，in，with its own powder ；which powder may be procured from the clips and fmall pieces，either by grinding or pounding it in a large mortar．

In the year $179+$ the Society adjndged the gold medal to Mr Wiiliam Hayward of Hanbury，Oxtord－ Shire，lir propagating rhubarb by offsets taken trom the crowns of large plants，inltead of feeds，for the pur－ pofe of bringing it to perfection in a fhorter time，which fully autwered his expectations．Mr Hayward was a candidute in the year 1789 for the gold medal；but having milunderfood their rules，he was not entitled to it，theugh with great propnicty they voted to him the tilver medal ；in confequence of which he fent them his method of culture and cure．His method of cultiva－ ting Turkey rhubarb from feed is thus explained to the Society：＂I have ufually fown the feed about the be－ ginning of February，on a bed of good foil（if rather landy the better），expofed to an eaft or weft afpest，in preference to the $f=u t h$ ；obferving a full fun to be pre－ judicial to the vegetation of the feeds，and to the plants whilt young．The leeds are beft fown moderately thick（broad．caft），treading them regularly in，as is ufual with partinips and other light feeds，and then ra－ king the ground imouth．I have fometimes，when the feator has been wet，made a bed for lowing the rhu－ tarb feeds upon，about two feet thick，with new dung from the table，covering it near one foot thick with good foil．The intent if this bed is not fur the fheic of warmoth，but folcly to prevent the riling of carth－ worms，which，in a molt feafora，will frequently deltroy the young crop．If the feed is good，the plants often rife too thich；if io，when they have attained fix leaves they theuld be takien carefully up（where too clofe）， leaving the fanding cinp ei ht or ten inches apart： there taken up in iy be pianted ot the fime dinance，in a fiefh foot of grrimed，is order to burnilh other pha t： tions．When the plants in general are growa to the fire that cabbage plants are vifally fet cue for a dand－ ing crep，they are bett phated wi．e：e they are to re－ main，in beds $f$ ur fect wide，one sow along tise nidede of the bed，laving two jards dikance between the

## RIE [200] iरIII

Kineun. Rhetn.
plants, allowing an alley between the beds about a foot wide, for conveniency of treeding the plants. In t.ie autumn, when ine dicajed leaves are removed, if the thovelng of the alleys ate thrown over the crowns of the pla:its, it "ill be found of fervice.

His mode of cuitivating the fame plant by offsets is thus given: "On taking up fome plants the laft fping, I fipped of feveral ofiscts from the heads of latge plants: theie I fet with a dibble about a foot apart, in oeder, if I found thein thrive, to remove them into ther beds. On examining them in the antum, I was furprifed to fee the progrcts they had made, and pleafed to be able to furnith niy beds with 40 plants in the molt thriving flate. Though this was my firlt experiment of its kind, I do not mean to arrogate the difcovery to myfelf, having known it recently tried by others, but without being informed of their fuccefs. I have reafon to think this valuable drug will, by this method, be brought much fooner to perfection than from feed."

His method of curing rhubarb is thus defcribed: "The plants may be taken up cither early in the fpring, or in autumn, when the leaves are decayed, in dry weather if polible, when the roots are to be cleared from dirt (without wahning) : let them be cut into pieces, and with a tharp knice freed from the outer coat, and expofed to the fin and air for a few days, to render the outinde a little dry. In order to accelerate the curing of the largelt pieces, a hole may be fcooped out with a penknife: thete and the fmaller parts are then to be itrung on packthread, and hung up in a warm room (I have always had the conveniency of fuch a one over a baker's oven), where it is to remain till perfeetly dry. Each piece may be rendered more fightly by a common file, fixing it in a fmall vice during that operation: afterwards rub over it a vely fine powder, which the fmall roots furnifh in beautiful perfeation, for this and every other purpofe where thubarb is required."

In the jear 1794, ton, the Society adjudged the gold medal to Mr Ball for his method of curing the true lhubarb, which is as follows: "I take the roots up when I find the ftalks withering or dying away, clean them from the earth with a d: $y$ bruff, cut them in fmall pieces of about four or five inches in breadth, and about two in depth, takingaway all the bark, and make a hole in the middle, and ftring them on packthread, keeping every piece apart ; and every morning, if the wedther is clear and fine, I place them in the open part of the garden, on flages, erected by fixing fmall pofts about fix feet l:igh in the ground, and fix feet afinder, into which I fix horizontal pegs, about a foot apart, beginning at the top; and the rhubarb being fringed crotswife on fmall poles, I place them on thefe pegs; fo that if it thould rain, I could eafily remove each pole with the fufpended pieces, into any covered place. I never fuffer them to be out at night, as the damps at this feafon would be apt to mould them; and if at any time I perceive the leaft mark of movld, I rub it off with a dry cloth. I I fome of the pieces of rhubarb which I have cured this year, I have made holes about half an inch diameter in the middle, for the free paffage of air, and

Vol. XVI.
have found that evory one of theié pieges dricd batter than the ofhers whete no fuch holes wew made ; ond have iikewife hung feveral Atrings in the kitchen, ard never expoted then in the opes air, and frund them to ary cxccudingly well, and much betier than th te in the ope air. Some years fince I dried a quanti:y of thu; atb on a mali-kiln, keeping up the therme me:er to so degrees, which anfiwered well, but I think rathe: dried too quick: the roots which I have cured this year are a pat of the plantation of 1789 , and for which the Society was to kind as to give me a medal (A)."

RHEXIA, in botany: A genus of the monogynia order, lelonging to the oftandria clafs of plants; and in the natural method ranking with thofe of the 1 th order, Calycanthemas. The calyx is quadrinu, with four petals inferted into it; the antherx are declining; the capfule is quadrilocular, within the belly of the calgy.

RHINANTHUS, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 4oth order, Perfonata. The calyx is quadrifid, and ventricofe ; the capfule bilocular, obtufe, and compreffed.

RHINE, a large river of Germany, famous both in ancient and modern hiftory. It rifes among the Alpes Lepontix, or Grifons; and firtt traverfing the Lacus Acronius, divides the Rhroti and Vindelici from the Helvetii, and then the Germans from the Gauls and Belgx; and running from fouth to north for the greatelt part of its way, and at length bending its courfe weft, it empties itelf at feveral mouths (Cxiar); at three mouths into the German ocean, (Pliny); viz. the weftern, or Helius; the northern, or Fleuvus; and the middle between both thefe, which retains the original name, Rhenus: and in this Ptolemy agrees.Mela and Tacitus mention two channels, and as many mouths, the right and left; the former running by Germany, and the latter by Gallia Belgica: and thus alfo Afinius Pollio, and Virgil ; the cut or trench of Drufus not being made in their time, whereby the middle channel was much drained and reduced, and therefore overlooked by 'Tacitus and Mela; and which Pliny calls the Scanty. To account for Cxfar's feveral mouths, is a matter of no fmall difficulty with the commentators; and they do it no otherwife than by admitting that the Rhine naturally formed fmall drains or rivulets from itfelf; the cut of Drufus being long pofterior to him ; in whofe time Afinius Pollio, quoted by Straho, who agrees with him therein, affirmed that there were but two mouths, finding fault with thofe who made them more: and he mult mean the larger mouths, which emitied larger itreams. The Romans, efpecially the poets, ufed the term Rbenus for Germany, (Martial).-At prefent, the river, after entering the Netherlands at Schenkinhaus, is divided into feveral channels, the two largeft of which obrain the names of the Lech and the Waal, which running thro' the United Provinces, falls into the German ocean below Rotterdam.

M. ilNLBERC, at wn of Commaty, in the circle of the lonwer Rlane, and diorete of Cologne. It was in the prifition of the Formeh, but reitered to the - roilisti p uf Cologne by the treaty of Uerecht. It is Ritud on the Rhine, in E. Loong. 6. 3\%. N. Lit. 51. 30.

KHINLC(5, a town of Germany, in the archbiIh prsic of C. loegne, featel on the Khine, E. Long. 7.
 fume name in Swifurand, cafital of Rhinthat, feated on the Rhane, near the lake of Conitance, with a good catle. E. Long. 10.53. N. Lat. $47 \cdot 3 \mathrm{~S}$.

RIIINFELD, is fimall but ltrong town of Germany, in the circle of Suabia, and the beft of the lour foretl-towns belonging to the houte of Autrid. It has been often taken atnd retaken in the German wars: and is feated on the Rline, over which there is a handome bridge. Ł. Leng. 7. 53. N. Lat. 47. 40.

RHINEGAU, a beautiful diftife of the electorate of Slentz, is lituated on the Rhine, about threc miles from the city of Mentz, and is fo populous that it looks like one entire town intermixed with gardens and viseyards. The Rhine here grows altonifhingly wide, and forms a kind of fa, neat a mile broad, in which

Reifoach:
I ravcls :hrought
Cermany, i) $1.2=6$.
are jereral well wooded little iflands. The Rhinegau forms an anphitheatre, the beanties of which are beyond all delcription. At Walluf, the very high hills come nearly dom to the river fide; from thence they recede again into the country, forming a kind of half circle, the other end of which is 15 miles off at Rudefluim, on the banks of the Rhine. The banks of the river, the hills which form the circles, and the fopes of the great mountains, are thick fown with villages and hamlets. The white appearance of the buildings, and the fine blue flated roofs of the houfes piaying amidll the various green of the landicape, have as admirable effect. In the fance of every mile, as you fail down the river, you meet with a village which in any nther place would pars for a town. Nany of the villinges contan from 300 to 400 families; and there are 36 of them in a Space of 15 miles lonis and fix miles hroad, which i, the width of this beatuful amphitheatre. The dectivities of all the hills and mountains are planied thick with vineyards and fruit trees, aud the thick wooded topes of the hill: caft a gloomy borror neer the othen wite cheerful landicape. Every now and then a row of rugged hills run dircaly down to the thore, and domineer maj. ftically over the lefler hills underticm. Oncme rif th. fe great moumains, $j$ ill about t! = middle of the Rlii.çat, , ou meet with FohannisBorg, a village wisich pr duces fome of the belt Rhemind Before this vill:ige is a pretty litice rifing, and .ear the banks of the river there is a very fine old catle, v. hich gives unipcatalle majelty to the whole landfe:pe. I:C'ced, in every village, jou meet with fome or ether large bullding, wh.ch coneributes very much to the desuration of the wliols. 'I'his country is indebted for its

Fiches to this femicircnlar hill, which proteets it from Rainese: the cold winds of the calt and north, at the fame time that it leaves rocom enough for the fin to exercife his benign influcnces. "The groves and higher 0lopes of the lills make excellent paftures, and produce large quanti:ies of dung, which, in a country of thas fort, is of incllimable value.

The bank of the Rhinc, opprfite to the Rhinegat, is exceedingly barren, and heightens the beaty of tle prolpect on the other fode by the contrat it cahibiss ; on this inde, yon hardly meet above three or !our villo?ses, and thefe are far dittant from each oth.r. The great interval between them is occupied by heaths and meadows, only here and there a thick buth aitords fome fhede, and a few corn fichls among the tillages enliven the glomny landfape. The back ground of this country is the molt pifीurcque part of it. It is formed by a narrow guliet of mountains, which diminith in per. fpective between Rudefteim and Bingn. Perpendicular moantains and rocks hang over the Rhine in this phace, and feem to make it the dominion of eternal night. A: a diftance, the Rhine feems to come out of this land. feape through a hole under ground ; and it appears to run tedioully, in order to enjoy its courfe thrungh a pleafant comatry the longer. Amidlt the darknefs which covers this back ground, the celebrated Moufe tower feems to fwim upos the river. In a word, there is not any thing in this whole tract that does not contribute fomething to the beaty and magnificence of the whole; or, if I may be permited the exprefiron. to make the paradife more welcome. As you fail along the Rhine, betureen Mentz and Bingen, the banks of the river form an oval amphitheatre, which makes one of the richeft and moft piturefque landtcapes to be feen in Europe. The inhabitants of thefe regions are fome or them extremely rich, and fome extremely poor. The happy middle flate is not for countries the chief product of which is wine; for, belides that the cultivation of the vincyard is infinitely more troublefome and expenfive than agriculture, it is fubjected to revoJuions, which in an inftant reduce the holder of land to the condition of a dsy labourer. It is a great miffortune for this country, that, thongh reftrained by law, the nobility are, throng! comivance of the Eleftor, allowed to purchafe as much land as they pleafe. The peafant generally begins by manigg in debt for his vineyard; fo llat if it does not turn out well, he is reduced to day-ldb.mr, and the rich man extends his poffelions to the great detriment of the country. 'lhere are feveral peafints here, who having incomes of 30 , 50 , or 100,000 guidels a-year, have laid afide the peatintht, and afumed the wine merchant; but, fplendid as their fituation is, it des not compenfite, in the eyes of the harnane man, for the firht of lo many poor people with which the villages fwa: m. In order to render it country of this kin. profperous, the Atate thould appropuiate a fund to the purpofe of maintaininy the peafint in bad years, and giving him the affitance which his necelities, and his want of ready money, may from time to time make convenient.

The inhabiants of the Rhinegau are a handfome and uncemmonly trong race of men. You ise at the very firet ifpeet that their wine gives them incrry hearts and found bedies. They lave a great deal of matural wit, and a vivanity and jocofeness, which diftinguifhes them

## RHI

Whinfels veiy much from their neighbours. Yot need only compare them with fome of thefe, to be convmed that the drinker of wine excels the drinker of beer and water, both ia body and mind, and that the inlabitant of the fouth is much fouter then he who live, in the north; for though the wine drinker may not have quite as much feih as he who drinks only beer, he has beter blood, an I can bear much more work. Tacitus had already obferved this, in his treatife De moribus Germanorn". "The large and corpulent bodies of the Germans (fays he) have a great appearance, but are not made tu laft." At that time almoft all the Germans drazk only water; but the more drinking of winc has effected a revolution in feveral parts of Germany, which makes the prefent inhabitants of thefe countries very different from thofe defcribed by Tacitus. Black and brown hair is much commoner here than the white, which made the Germans to famons in old Rome. "It will be eafily imagined (fays Baron Reifoach), that the monks fare particularly well in fo rich a country. We made a vifit to the prelate of Erbach. Theie lordly monks, for fo in every refpect they are, have an excellent hunt, rooms magnificently furnifted, billiard tables, half a dozen benutiful finging women, and a ftupendous wine cellar, the well ranged batteries of which made me fhudder. A monk, who faw my aftonifhment at the number of the call:s, affured me, that, without the benign influence which flowed from them, it would be totally impolible for the cloiftcr to fublift in fo damp a fituation."

RHINFELS, a caftle of Germany, in the circle of the Lower Rhine, in a county of the fame name. It is looked upon as one of the moft important places feated on the Rhine, as well in regard to its ftrength as fituation. It is near St Goar, and built on a craggy rock. This fortrefs commands the whole breadth of the Rhine, and thofe who pafs are always obliged to pay a confiderable toll. In the time of war it is of great importance to be mafters of this phice. E. Long. 7. 43. N. Lat. 50. 3.

RHINLAND, a name given to a part of South Holland, which lies on both fudes the Rhine, and of which Leyden is the capital tuwn.

RHINOCEROS, in zoology, a genus of quadrupeds belonging to the order of bellux. The name is entirely Greek; but thefe animals were totally unknown to the ancient Greeks. Atiftotle takes no notice of them, nor any other Greek writer till Straho, nor Roman till Pliny. It is probable they did not frequent that part of India into which Alexander had penetrated, fince it was neal 300 years after that Pompey brought then to Europe. From this time till the days of Heliogabalus, the rhinoceros was frequently exhibited in the Roman fpectates; and he has often been tranfported into Europe in more modern times; but they were long very ill reprefented, and very imperienly deficribed, till fome that arrived in London in 1739 and ${ }^{1} 1+1$ were infpected, by waich the errors and caprices of former writers were detected.

There are two fyecies of rhinoceros, the firt of which is the unicornis, the length of which, Buffon
tells us, fient the extremity of the muzz? to the rri- Riineerng gin of the :ail, is at leat 12 feet, and the circumfe- alute rence of the body is neary he farra. "The rimo-occoxis.ana cerus which came to Lenden in the year 1739 was fent guton', from leugal. Thourlh not above two years of a co, cusural the expmec of his fo d and jouney am uncel to nat lifuris L. 1000 Sterlning. He was fed with tice, Higar, and wol v. hay. He had daily feven pounds of rice, mixed with 92 , sic. three pounds of fugar, and divided into three portions. He liad likewile hay and green herbe, which han he preferred to hay. His drink was water, of which he took large quantities at a timic (A). He was of a peaceable difpolition, and allowed ail parts of his body to be touched. When huncry, or ftruck by ary perfon, he became michievous, and in both cales nothing appeafed him but food. When enraged, he fprung forward, and rimbly raifed himfelf to a great height, pufhing at the fume time his lead furioutly agai:if the walls, which he performed with amazing quicknefs, notwithtanding his heavy alpect and unvieldy mafs. I often obferved, fays Dr laafons, thefe movements pioduced loy rage or impatience, elpecially in the morning before his rice and fugar were brought to him. The vivacity and promptitude of lis movements, Dr Parfons adds, led me to think, that he is altogether unconquerable, and that he could eafily overtake any man who thould offend him.
"This rhinoceros, at the age of two years, was not taller than a young cow that has never produced. But his body was very long and very thick. His head was difproportionally large. From the ears to the hern there is a concavity, the two extremities of which, namaly the upper end of the muzzle, and the part near the ears, are conliderably raifed. The horn, which was not yet above an inch high, was black, fmooth at the top, but full of wrinkles directed backward at the bate. The noftrils are fituated very low, being not ahove an inch diftant from the opening of the mouth. The under lip is pretty fimilar to that of the ox; but the upper lip has a greater refemblance to that of the horfe, with this advantageous difference, that the rlitnoceros can lengthen this lip, move it from fide to fid. roll it about a faff, and acize with it any object he wifhes to carry to his mouth. The tongue of this young rhinoceros was foft, like that of a calf. His eye; had no vivacity: In figure they refembled thofe of the hog, and were fituated lower, or nearer the notitil, than in any other quadruped. His ears are large, thin at the extremities, and contrakted at their origin by a kind of annular rugofity. The neck is very thori, and furrounded with two large folds of ikin. The fhoullers are very thick, an:d at their juncure there is another fold of fkin, which defcends upon the fore leg:. The budy of this young rhinnceros was very thick, and pietty much reiemoled that of a cou abrut to briag forth. Between the hody and crnpper tiere i, anther fold, which defeends upon the hind legs. Lanity, an. other fold tranfverfely furrounds the infciour pat of the crupper, at forne difance from ihe tail. Tlie belly was large, and hung near the ground, particularly its middie part. 'The legs are round, thick, flowig, and
(A) "Their food in a fate of nature is the groffef herhs, as thifles and thorny fhrubs, which they prefer to the foft pafure of the belt meadows; they are fond of the fugar cane, and eat all kinds of grain, but for isim they have ro appetite."

Rhinoceres tieer juint leacued backwards. 'lhis juint, whicl, of the thin, appears when le fands. The tall is thin, ata paportionally thort ; that of the rhinoectus in ofton mentored, caceeded not 16 cr 17 inche, in length. Is turas a little thicker at the extremity, which is garsithed with rome thert, thick, lard hairs. The them wthe penis is very extraordenary. It is contained in a prepuce, of theath lite that of the hores; and the firlt thing that appears in the time of exerion is a fecund p:entuce, of a Heth-colcur, from which there iflius a l.oblow tube, int the fom of a funncl cut and bordered fonewhat like a flwer-de-luce, and conftitutes the ghans and extremity of the penis. This anomalons glars is it a paler feth colcur than the fecond prepucc. In the meft wigercus ereation, the penis extends not above sieht inches ont or the body ; and it is eatily procured by rubbing the animal with a handful of fraw when he les at his eale. The diredtion of this organ is not Itraight, but bended backward. Hence he throws out his unime belind; and from this circumfarice, it may be inferred that the male covers not the female, bat that they unite with their cruppers to each other. The female organs are fituated lite thofe of the cow ; and fie exately retembles the male in figure and groflinefs of body. The fkin is fothick and impenetrable, that when a min lays hold of any of the folds, he would imagine he is touching a wooden plank of half an inch thick ( s When tanned, Dr. Grew remarks, it is exceflively hard, and thicker than the hide of any other terreftial animal. It is cvery where covered more or lefs with in-- ruftations in the form of galls or tuberofities, which are pretty fmall on the top of the neck and back, but become larger on the fides. The larget are on the fhoulders and crupper, are llill pretty large on the thighs and legs, upon which they are fpread all round, and even on the fect. But between the folds the fin is penetrable, delicate, and as foft to the touch as filk, while the extemal part of the folld is equally hard with the reft. This tadder Rk in between the folds is of a light 11 fin colour ; and the fkin of the belly is nearly of the time colour and confiftence. Thefe galls or tuberoities !huuld not be compared, as tome authors have done, to tciles. 'They are only limple indurations of the fikin , ithout any regulatity in their figure or fymmery in thair repuate poltions. The dexibility of the $\AA$ in in the fold endbes the rhinoceros to move with facility fis head, neek, and members. The whole body, ex-- ept at the juints, is infexible, and refembles a coat of mail. Dr Pations semarks, that thio animal littoned witi a deep and long eontinued attention to any lind of noies and that, though he was fleeping, tatmeg, or cobejing any other prefling demands of na. zure, he railed lis lead, and littered till the roife cent-"

Thif: : mimals never affemble or march together in tr mops is.se celeplants. Being of a more tolitary and faa age dripolition, they are more dilicult to hunt and to overconac. 'They aever attack men, however, except when they are pro\%oked, when they are very finious and form dable; but as they fee only before them, and
not very iazaple, and as they turn with great diniculty, twey may be calily avoided. The fkin of theie animals is fo catremely hard as to retift fabres, lances, javelins, and cven mulket balls, the only penctrable parts being the belly, the eye-, and about the ears. Hence the hunters generally attack them when they lay down to dieep.'their flell is comidered as excellent by the Indians and Afric.ms, but efpecially by the Hottentoss; and it they were trained when young, they might be rendered doneftic, in which care they would multiply more eafily than the elqpian!. They inhabit Bengal, Siam, Co-chir-China, (unl:gfi in China, the ifles of Java and Sumatra, Congo, Angol:, Ethiopia, and the country as low as the Cape. 'They love thady forefts, the neighbouthood ci tiver, and marlly places. They wallow in the mire like $\log$, and are faid by that means to give thelter in the folds of their ikins to tcorpions, centipedes, and other inlects 'This is denied by Buffon and Edwirds, though the furgeon of the Shatefoury had otferved in a rhinoccros, newly taken after having weltered in the mud, reveral infeas concealed under the ply. of the $1 k i n$. This carties with it every appearance of probability; for as the ereature welters in mud, it is impolible ior it to do fo without bringing up with it fome of the infefts which live in that mud; and when this is the cafe, it furely camnot be unnatural to fuppofe that they would thelter themfelves under the plaits of the k in. Mr Bruce had an opportunity of examiking the tkin of a rhincceros befure his muddy covering had been fcr.aped off, and faw under it feveral very large worms, but not of the carnivorous kind. He faw likewife feveral fmaller animals refembling ear-wigs, which he took to be goung fevlopendrx; and, though he fearched no farther, we muft certainly confider this as a proof of what the furgeon of the Shafteflury related. Mr Bruce fuppules, too, that they welter in mine, partly in order to fercen themielves by a cafe of mud from the attacks of that mifchievous fly which infefts the animals of Abyfinia to fich a degree. "The time of the 月y (fays he) being in the rainy feafon, the whole black eart's turns into mire. In the night, when the Hy is at rett, the minoceros chonfes a convenient place, and chere, rolling himfe $f$ in the mud, he clothes h.melf with a $k$ nd of cate, whicin defends him againtt his enemy the following day. Ihe winkles and plaits of his thin ferve to kecp this maddy flater firm upon hinn, all but about lis heps, thoulders, and legs, where it eracks and lal's off by motion, and leaves him expofed in thofe places to the attacks of the fly. The irching and pain which foll wo occation him to rub himfulf in thote pats agmant the ruglelt uecs; and this is at lealt one caufe if the putules or tubercles which we fee upon thele phaces, both in the elephafte and rhinoceros." They hing torth only oney ung at a time? abuut which they are very tolicitous. They are faid to confort with tygers; a hory fiunded merel on their common attachment to the lides of 1 ivers, by which manas they are oiten found near cach other. 'Their fkin, fleth, hoofs, tecth, and even dmy, arc uld in India medicinally. The hom, efpecially that if a virgin rhinoceros, is confidered as an antidete againit poifon. Every
(3) This Mr Bruce denies to be the cale, and fupects, where it does occur, that it is the effect of difeafe, or of a diferent habit acepuired by keeping. In their matural fate, he thinks they prevent this rigi lity by wallowing to the rused.

## K H I

Rhinoccros horn, however, has not this property; fome of them felling very cheap, while others are extremely dear.

Some writers are of opinion, that the rhinoceros is the unicorn of holy writ and of the ancients, and that the orgx or Indian afs of Arifotle, who fays it has but oale horn, was the fame, his informers compating the clumfy thape of the rhinoceros to that of the als. It was alro the bos unicornis and fera monoceros of Pliny, both of which were of India; and in his account of the monoceros he exactly defcribes the great black horn and hog-like tail. The unicorn of Scripture is conlidered as having all the properties of the rhinoceros, as rage, untameablenefs, great fiwiftnefs, and valt Arength. This opinion is molt ably fupported by Mr Bruce. "The derivation of the Hebrew word rem (fays lee, which ia our verfion is tranflated znicurn, both in the Hebrew and the Ethicpic, feems to be from erectnefs, or ftanding ftraight. This is certainly no particular quality in the animal itfelf, who is not mure or even fo much erect as many other quadrupeds, for in its knees it is rather crooked ; but it is from the circumftance and manner in which its horn is placed. The horns of all other animals are inclined to fome degree of parallelifm with his nofe or os frontis. The horn of the rhinoceros is erect and perpendicular to this bone, on which it ftands at right angles, thereby poffeling a greater purchafe or puwer, as a lever, than an hurn could pofitbly have in any other pofition. The fituation of the horn is very happily alluded to in Scripture ; 'My horn thalt thou exalt like the hoon of an unicom.' And the horn here alluded to is not wholly figurative, but was really an ornament worn by great men in the days of vikory, preferment, or rejoicing, when they were anointed with new, 1 weet, or frefh oil; a circumftance which David joins with that of eresting the horn.
"Some authrors, for what reafon I know not, have made the reem, or untcorn, to be of the deer or antelope kind; that is, of a genus whole very character is fear and weaknefs, directly oppofite to the qualities by which the reem is delcribed in Scripture : befides, it is plain that the reem is rot of tae clafs of clan quadrupeds; and a late modera traveller very whimfically takes him fur the leviathan, which certainly was a fizh. Balaam, a prieft of Midian, and fo in the neighbuurhood of the hunts of the rhinoceros, and intinatiely connected with Ethiopia, (for they themflves vere fhepherds of that country), in a tranfpurt, from contentplating the itrength of Iirael, whom he was brought to curie, lays, they had, as it were, the Itrength of the reenl. Job makes ficquerit allution to his great ftrength, ferociiy, and indocility. He alks, © will the reem be will.ng to ferve thee, or abide by thy crib?" that is, Will he willingly ceme into thy fable, and eat at thy manger? And again, 'Cantt thu bilid the reem with a band in the furrow; and will he harrow the vaileys tor thee !'-In other words, Canft thou make hm go to the plough or harrows?
"The rhinoceros, in Geez, is called Arave Harich, and in the Amharic Auraris ; both which names ligrify 'the large wild bealt with the horn.' 'This would feem as if applied in the fpecies with one horn. On the other hand, in the country of the Shangalla and in Nubia he
is called Givamg:irn, or 'horn upon horn;' and thiswotild Rhinocerer feem to denote that he had two. The Ethiopic text renders the word riem, 'Arwe-Harich;' and this the Septuagint tranflates monoceros, or unicorn. The pritcipal reaion of tranflating the word unicorn rather than rhinoceros, is from a prejudice that he muft have had but one horn. But this is by no means fo well founded as to be admitted the only argument for eftablifining the exiftence of an animal, which never has appeared after the fearch of 'fo many ages. Scripture fipeaks of the horns of the unicorn; fo that even from this circumftance the reem may be the rhinoceros, as the Afiatic, and part of the African rhinocercs, may be the unicorn."

The rhinoceros bicornis was long known in Europe merely by the double horns which were preferved in various cabinets; and its exiftence, though now paft all doubt, has been frequently queftioned. Dr Sparman, in his voyage to the Cape of Good Hope, killed two of thefe animals, which he diffected, and very minutely defcribes. The horns, he fays, in the live animal, are fo mobile and loofe, that when it walks carelefsly along, one may fee them waggle about, and hear them clath and clatter againit each nther. In the Phil. Tranf. for 1793, we have a defcription of the double-horned rhinoceros of Sumatra, by Mr Bell, furgeon in the fervice of the Eatt India Company at Bencoolen; and this account, though it differs confiderably from that of Sparman in fome particulars, we fhall infert here. "The animal (fays Mr Bell) hercin deferibed was fhot with a leaden ball from a mufket about ten miles from Fort Marlborough. I faw it the day after; it was then not in the leaft putrid, and I put it into the pofition from which the accompanying drawing was made. (See Plate coccxxxvili.) It was a male ; the height at the fhoulder was 4 feet 4 inches; at the facrum nearly the fame; from the tip of the nofe to the end of the tail eight feet five inches. From the appearance of its teeth and bones it was but young, and probably not near its full fize. The fhape of the animal was much like that of the hog. The general colour was a brownith aft ; under the belly, between the legs and folds of the fkin, a dirty flefh enlour. The head much refembled that of the fingle horned rhinocelos; the eyes were fmall, of a brown colour ; the nembrana niritans thick and frong: the fkin furrounding the eyes was wrinkled; the noitrils were wide; the upper lip was pointed, and hanging over the under.
" There were iix molares or grinders, on each fide of the upper and lower jaw, becoming gradually larger backward, particularly in the upper; two tectil in the front of each jaw ; the tongue was quite fmonth; the ears were imail and pointed, lined and edged with fhort black hair, and fituated like thote of the finglc-horned rhinoceros. The horns were black, the larger was placed immediately above the nofe, pointing upwards, and was bent a little back; it was about niuc inclies long. The fmall horn was four inches long, of a py:amidal Thape, flattened a little, and placed above the eyes, rather a little more forward, ftanding in a line with the larger horn, immediately above it. They were both firmly attached to the finull, ner was there any appearance of joint or mufcles to move them (c). The ncck was thick and fhort, the fkin on the under fide thrown in-

[^9]$\underbrace{p} \quad$ - $\quad$ in fuits, and ticte folds again wrinkled. Tl:e body

 rilar th a apicarance of finets: th: legs were thick,
 chisulhofi, of a Lhokilh culour, which furrounded lats the finot, o:a in front, the othe:s on cach sideThe ! les of the fect wore cenves, of a ligitt colour, and the cuticle oa then not thicker than that cn the tact of a man who is ufed to walking; the tellict-s larilly appe:ired externally; the penis was bent backward, and opericd abont is inches below the anus. At its origin it was as thick as a man's leg, and about two feet and a half long; the bend in it occafors the uine to be difharged backwards. The glans is very fingulur; the epening of the urethra is like the mouth of a wip with its brim bending over a little, and is about three quanters of an inch in dimmeter; the glans here is :bout half an inch ia diameter, and continues that thickhef, for an inch and athalf: it is then inferted into another cup like the firft, but three times as large; the glans after wards gradually becomes thicker, and at about nime irches from the opening of the urethra are placed two bodies on the upper part of the glans, very like the nipples of a milh-cow, and as large; there heeome tureid when the penis is ereated; the whole of this is contaned in the prepuce, and may be conlideret as glans. From the os pubis arifes a ftrong inufcle, which fon becomes tendinous : this tendon is continued along the back or upper part of the penis; it is flattened, is about the ifee of a man's little finger, and is inferted into the upper part of the glans, near the end. The ufe of this mufcle is to ftraiten the penis. On the under fisc of the penis there are two mufcles, antagonits to the aboive; they arife from the os ifchium flefhy, run along the lower fide of the penis, on each fide of the corpus fpongiofum, and are inferted fethy into the lower fide of the glans ; the action of there mufcles will draw in the penis, and bend it. The male has two nipples, like the female, fituated between the hind legs; they are about half an inch in length, of a pyramidal form, rounded at the erd.
"The whole fkin of the animal is songh, and covered very thinly with thort black hair. The fkin was not more than one third of an inch in thicknefs at the ftrongelt part; under the belly it was lardly a quarter of an inch; any part of it might be cut through with cafe by a common diffecting knife. The animat had not that appearance of arman which is obferved in the fingle-horned rhinceeros. Since I difefted the male, I have had an opportunity of examining a female, which was more of a lead enlour: it was younger than the male, and had nor fu many folds or wrinkles in its ikin; of cuurfe it had fill lefs the appearance of ar mour. The only caternal mark which dilluguithes it from the male is the vagin:t, which is clofe to the anus; whereas in the male the opening for the renis is 18 inches below the anus."

From the difference between this account and Spar-
nun's, which in fume p.utieu'ars is confiderible, and Rainocerd, from the divitronce of thape, we are dippofed to think them waleies. Mh bruce's drawing of the thinoceros bicornis is unquelion Why a deceptonn ; the body of the mimal, as thare teprefenicd, corrcfponds exact:y whathat of the unicornis except in its laving two d orns on its herd. la the muterm of the late Wr Wridiam Iunter, the two-horned inimal was prefervel, agreeing extacly with the genctal accounts and figures we have of tiat animal, but duTering effen ially from Mr Pruce's. Fur further parioulars selpecing thefe cuious animals, we 1 eter to Duffon, vol. vi. P. $9^{2-117}$; Sparman's Voyage to the Cape, vol. ii. chap. 12.; and Bruce's Travels, vol. iv. 1. 295, \&c. and Appendix, p. 85, \&c.

Rumoceros-Mir.t. Sce loucerus.
RHITIMNA. See Retimo.
RHIZOBALITS, in botany: A genus of the tetragynia oeder, belonging to the polyandria chats of plants; and in the natural method ranking under the 23 dorder, Trihilatic. The calyx monnfhyllous, flefhy, and downy; the corol'a contitts of five petals, which are round, concave, flefhy, and much larger than the calyx; the Ramina are very mumerous, filiform, and longer than the corolla ; the fyli are f ur, filitorm, and of the length of the ftamina; the pericarpium has four drupx, kidney-haped, compreffed with a flethy fubftance intide, and in the middle a flat large nut containing a kidney-thaped kerncl. Of this there is only one fipecies, viz. Pelia. The nut is fold in the fhops as American nuts; they are flat, tuberculated, and kidney - fhaped, containing a kernel of the fame fhape, which is fiveet and agreeable. Clufius gives a good figure of the nut, and Aublet has one of the whole phant.
rhizophora, the mangrove, or Manslo, in botany: A genus of the monogy nix order, belonging to the d decandria elafs of plants; and in the natural method ranking under the 12 th order, Holoraces. The calyx is quadripartite, the corolla partite: there is one feed, very long, and carnous at the bufe. Thefe plants are natives of the Eaft and Welt Indies, and oten grow 40 or 50 feet high. They grow unly in water and on the banks of rivers, where the tide flows up twice aday. They preferve the verdure of their leaves through, uut the year. From the lowelt branches iffue long roots, which hang down to the water, and penctrate into the earth. In this pofition they refemble fo many arcades, from five to ten feet high, which ferve to fupport the body of the tree, and even to advance it daily into the bed of the water. Theie arcades are fo clofely intertwifted one wirh another, that they form a kind of natural and tr.mparent terrace, ralied with fuch folidity over the water, that one might walk upon thom, were it not that the branches are too much encumbered with leates. The moft natural way of propagating thefe trees, is to fiffer the feveral fender fmall filaments which iffue from the main hranches to take root in the earth. The moft conmon method, however, is that of laying the fmall lower branches in bakkets of mould or earth till they have taken rout.

The defeription jult given pertains chiefly to a particular fecies of mangrove, termed by the Weft Indians
that onee at a hunting matels he faw the point of a rhinoceros's horn broken off by a mulket-fhot; the confequence of which was, that the creature was for a moment deprived of all appearance of life.

## K H O <br> R H O

Rhizo- dians black mangles, on account of the brown dulky co. phora, lour of the wood. The bark is very brown, fmooth, Rhorles. pliant when green, and generally ufed in the Weft $1 n$ - dia iflands for tanning of leather. Below this bark lies a cuticle, or fkin, which is lighter, thinner, and more tender. The wood is nearly or the fame colour as the bark: hard, pliant, and very heavy. It is Irequently ufed for fue!, for which purpofe it is faid to be remarkably proper: the fires which are made of this wood being both clearer, more ardent and durable than thofe maac of any other materials whatever.-The wood is compact; almoft incorruptible; never lplinters; is eatily worked; and were it not for its enormous weight, would be commodioufly employed in almolt all kinds of work, as it poffeffes every property of good timber. To the roots and brinches of nangroves thaterare immerled in the water, oyiters fiequently attach thensfelves; fo that wherever this curious plant is found growing on the fea-flore, oyfler-filhing is very eafy; as in fuch cafes thefe flell-fith may be literally faid to be gathered upon trees.

The red mangle or mangrove grows on the feafhore, and at the mouth of large rivers; but it does not advance, like the former, into the water, It generally rifes to the height of 20 or 30 feet, with crooked, knotty branches, which proceed from all parts of the trunk. The bark is flender, of a brown coluur, and, when young, is fmooth, and adheres very clofely to the wood; but when old, appears quite ctacked, and is eafily detached from it. Under this bark is a fkin as thick as parchment, red, and adhering clofely to the wood, from which it cannot be detached till the tree is felled and dry. The wood is liard, compact, heavy, of a deep red, with a very fine grain. The pith or heart of the wood being cut into fmall pieces, and boiled in water, imparts a very beautiful red to the liquid, which communicates the fame colour to wonl and linen. The great weight and hardnefs of the wood prevents it from being generally ufed. Ftom the fruit of this tree, which, when ripe, is of a violet colour, and refembles lome grapes in tafte, is prepared an agreeable liquor, much elteemed by the inhabitants of the Caribbee iflands.

White mangle, fo termed from the colour of its woud, grows, like the two former, upon the banks of rivers, but is feldom fomd near the feal. The bark is grey; the wood, as we have fuid, white, and when green, furple; but it dries as foon as cut down, and becones very light and brittle. This fpecies is generally called rope-manuave, from the ufe to which the bark is applied by the inhabitants of the Weft Indies. This bark, which, by reafon of the great abuncance of fap, is eafily detached when green from the wood, is beaten or brnifed betwixt two ftones, until the hard and woody part is totally feparated from that which is feft and tender. This laft, which is the true cortical fubltance, is tw- \{ted into ropes of a!l lizes, which are exceedingly ftroms, and not apt to rot in the waier.
RHODES, a celebrated illand in the Archipelage, the largett and moit eatterly of the Cyclides, was - known in ancient tin:es by the names of sfleria, $O$ flizifa, Evibrea, Trivacria, Corymbia, Pooffa, Alabyria, Marcia, Olo-fJs, Stadia Telckizisis, Pelagiu, and Rhodus. In later ages, the name of $R$ bodus, or $R$ bodes, prevailed, from the Greek word thodon as is commonly fup-
pofed, fignifying a "rofe;" the illand abounding very much with thele flowers. Others, however, give differRhodes. ent etymologies, among which it is difficult to find one preferable to another. It is about 20 miles diftant from the coalts of Lycia and Curia, and about 120 miles in compais.

Several ancient authors affert, that Rhodes was for- Its origin. merly covered by the fea, but gradually raifed its heard above the waves, and became an illand. Delos and Rhodes (fays Pliny), illands which have long been ** celebrater, iprung at firft from the fea. The fame fact is fupported by fuch a variety of other evidence as render it indubitable. Philo $t$ afcribes the event to the decteafe of the waters of the ocean. If his conjecture be not without foundation, molt of the illes of the A:clipelago, being lower than Rhodes, mult have had a fimilar origin. But it is much more probable that the volcanic fires, which in the fourth year of the 135 th 0 . lympiad, raifed Therafia and Thera, known at prefent by the rame of Saniorin, from the depths of the fea, and have in our days thrown out feveral fmall iflands adjacent, alfo produced in fome ancient era Rhodes and Delos.

The firf inhabitants of Rhodes, according to Dio- Firn inhadorus Siculus, were called the Telchine, who came ori-bitants. ginally from the ifland of Crete. Thefe, by their fkill in affrology, perceiving that the ifland was foon to be drowned with water, left their habitations, and made room for the Heliades, or grandfons of Phobus, who took poffeffion of the illand after that god had cleared it from the water and mud with which it was overwhelmed. Thefe Heliades, it feems, excelled all othermen in learning, and efpecially in aftrology ; invented navigation, \&e In after ages, however, being infefted with great ferpents which bred in the inland, they had recourfe to an oracle in Delos, which advificd them to admit Phorbas, a Theffalian, with his followers, into Rhodes. This was accordingly done; and Phorbas having deftroyed the ferpents, was, after his death, honoured as a demigod. Afterwards a coluny of Cretans fettied in fome part of the ifland, and a little before the Trojan war, Tlepolinius the fon of Hercules, who was made king of the whole ifland, and governed with grea: jultice and moderation.

After the Trojan war, all the ancient inhabitants were driven out by the Dorians, who continued to be malters of the inand for many ages. The government was at firt monarchical; bit a little before the expedition of Xerxes into Greece, a republican form of go$v$ rnment was introduced; during which the Riodiuns applied themfelves 10 ntvigation, and became very powerful by fea, planting fever.l colonies in diltant countries. In the time of the Peloponnefian war, the repuolic of Rhodes wiss rent in two factions, one of which favoured the Athenians, and another the Spartans; but at length the latter prevailing, democracy was abolithed, and an arilocr acy introdiced. About. $351 \mathrm{~B} . \mathrm{C}$. we find the Rhodims oppreffed by Maufolus king of Caria, and at latt reduced by Artemifia his widow. In this emergency, they applied to the Athenians ; by whofe allutance, probabiy, they regained their liberty.

For this time to that of Alemander the Great, the Subait to Rhodians eajoyed an uninterrupted tranqุuillity. To Alexander, him they voluntarily fubmitted; and were on that ac-

 nomy tou fos, atad hit ed gecte nambers of the intabitants. As tha ciow Wa, butit iat the firm of an amphatthentre, :und ro cure hat Leen zalion to elene the prpes and condui:s which convered the water into the sea, the lower parts ef the city were in an intant laid under water, icveral boules quite eovered, :atal the imhabitants drowned befure they could get to the higher phaces. Is the delage inereates, and the violent thowcr c continued, fome of the inhabitants made to ther thips, and abandoned the place, while others miferably poidhed in the vaters. Dut whle the city was thus threatened wita utt.r deftruction, the wall on a ludden burt atundel, and the water difhatging itleit by a violen: current into the ien, uilexpestedy delivered the mlabitunts from all danger.

The Rhodians fuffered greathy by this unexpected accident, but ioun retrieved thein lolles by a cloje alpplication to trade. During the wars which took place among the fucculfors of Alexander, the Rhodians obicred a ltrit neurtality ; by whelı means they enrichad themfolves fo much, that Rhodes became one of the moit upulent tates of that age; infomuch that, for the common good of Greece, they undertook the piratic cyar, and, at their own charge, cleared the feas of the bolu-
pirates who had for many years infefted the coalts of larope and Afia. However, notwithtanding the neutraliiy they profelfed, as the moft advantageous branches of their commerce were derived from Egypt, they were more attached to Polemy, king of that country, than to any of the neighbouriug princes. When there. fore Antigonus, having engaged in a war with Ptolemy about the ifland of Cyprus, demanded fuccours of them, they earnenly intreated him not to compel them to declare war againlt their ancient friend and ally. But this anfwer, prudent as it was, drew upon them the difplealure of Anigonus, who immediately ordered one of his adnarals to fail with his Heet to Rhodes, and feize all the thips that came out of the harbour for Egypt. The Rlodians, finding their harbour blocked up by the fleet of Antigonus, cquipped a good number of galleys, fell upon the enemy, and obliged him, with the lofs of many hips, to quit his flation. Hereupon Antigonus, charging them as aggrefors, and begimers of an unjuft war, threatened to befiege their city with the ferength of his whole ariny. The Rhodians endervoured by frequent emballies to appeafe his wrath; but all their remonatrances fersed rather to provoke than allay his refentment : and the only terms upon which the would hearten to any accommodat'on were, that the Rhodians lhould declare war againit Ptolemy, that they should admit his fleet into their hatbour, and that an hindred of the chicf citizens thould be delivered up to him as hollages if the performance of thefe articles. 'The Rhodians lent amballidors to all their allies, and (t) Ptolary in particular, imploring their allifance, and reprefenting to the latter, that their attaclament to dis interefl had drasn upon them the danger to which they were expofed. 'The preparations on bath fides were immenfe. As Antigonus was near lourfore years of
ace at that time, i.c commited the whole manatement ut the war to his fon Lemetras, waso atpeated before
 ports hivines mated 00,000 twen, and $10=0$ Rhodesice vellels laden with provifions and atil res of warlike en. Ucmerrus.
gines. As Rhoales had cnjoyed for matiy jears a profound tranquillity, atod been Iree from alf uc:allawons, the expeetation of booty, in the plander of fo wealthy a cty, allured maltitudes of pir i.es and nuercenaties to join Demerrius in this expedition; intomnch that che whole fea between the contincit and the illand wirs covered with hips; whely frack the Rhedians, who hiad a plofpeat of this nisity amman from the walls, with great terror and conllernation.

Demetrius, laving landed his troons without the reinh 6 s the enemy's machmes, detactied fereral fmall bodis to lay walle the country round the city, and cut down the trees aad groves, employing tise timber, and materals of the hufes vithout the walls, to fortify his camp with froug ramparts ard a treble palidade ; which work, as many hands were empluyed, was finithed in a few days. The Rhocians, on their pari, prepared for a vigurous defence. Nany great commanders, who had ligualized themfelves on other occations, thew themfelves moto the city, being defirous to try their fkill in military affals againft Demetrius, who was reputed one of the molt experienced captains in the conduct of fieses that antiquity had pruduced. The befieged began with dimilling frem the city all fuch perfons as were ufelefs; and then taking an account of thole who were capable of bearing arms, they found that the citizens amounted to 6000 , and the foreigners to 1000 . Liberty was promifed to all the flaves who thould ditinguilh themfelves by any gloriuus action, and the public engaged to pay the mafters their full ranfom. A proclamation was likewife made, declaring, that whocver died in defence of their conntry fhould be buried at the expence of the public ; that his parents and children thould be maintained out of the treafury ; that fortunes thould be given to his daughters; and his fons, when they were grown up, thould be crowned and prefented with a complete fuit of armour at the great folemnity of Bacchus; which decree kindled an incredible ardour in all ranks of men.

10
Demetrius, having platited all his engines, began to Engines of batter with incredible fury the walls on the fide of the Densetrius harbour ; but was for cight days fuccelively repulfed burnt. by the belieged, whu fet tire to molt of hi, warlike engines, and theseby obliged him to allow then fome refpite, which they made good ule of in reparing the breaches, and building new walls where the old ones were either weak or low. When Demetrius had repaired his engines, he ordered a general aflault to be made, and caufed his troops to advance with loud houts, thimking by this means to frike terror into the enemy. But the befieged were fo far from being intimidated, that they repulfed the aggreffers will great houghter, and performed the molt allobilhing feats of bravery: Demetrius returned to the affault next day ; but was in the fime mannor forced to retire, after laving lof at greit number of men, ind fonic officers of difinction. Ife lad feized, at his firt landing, an eminence at a fmall difance from the city ; and, having fortified this advantageous pull, he caufed feveral batterics to be crected diere, with engines, which inceltantly difcharged

Rhodes. ~ againft the walls flones of 150 pounds weight. The
towers, being thus furioufly battered night and day, began to totter, and feveral breaches were opened in the walls: but the Rhodians, unexpectedly fallying out, drove the enemy from their poft, everturned their machines, and made a moft dreadful harock ; infomuch that fome of them retired on board their veffels, and were with much ado prevailed upon to come afhore again.
Severaldef. Demetrius now ordered a fcalade by fea and land a: perate af. the fame time; and fo employed the belieged, that faukswith- they were at a lols what place they fhould chiefly deout fuccefs. fend. The attack was carried on with the utmolt fury on all fides, and the befieged defended themeives with the greateft ix:crepidity. Such of the enemy as advanced firt were thrown down from the ladders, and $r i$ iferably bruifed., Several of the chief officers, having mounted the walls to encourage the foldiers by their example, were there either hilled or taken prifoners. After the combat had lafted many hours, with great flaughter on both fides, "Demetrius, notwithftanding all his valour, thought it neceffary to retire, in order to repair his engines, and give his men fome days reft.

Demetrius being fenfible that he could not reduce the city till he was mafter of the port, after having refrethed his men, he :eturned with new vigour againt the fortifications which defended the entry into the harbour. When be came within the caft of a dart, he cauled a valt quantity of burning torches and firebrands to be thrown into the Rhodian thips, which were riding there; and at the fame time galled, with dreadful thowers of darts, arrows, and Itones, fuch as offered to extinguifh the flames. However, in fpite of their nitmolt efforts, the Rhodians put a ftop to the fire; and, having with great expedition manned three of their ftrongeft fhips, drove with fuch violence againft the veffels on which the enemy's machines were planted, that they were fhattered in pieces, and the engines difmounted and thrown into the fea. Exceftus the Rhodian admiral, being encouraged by this fucceis attacked the enemy's fleet with his three fhips, and funk a great many veffels; but was himfelf at laft taken prif mer: the other two veffels made their efcape, and regained the port.

As unfortunate as this laft attack had proved to Demetrius, he determined to undertake another; and, in order to fucceed in his attempt, he ordered a macline of a new invention to be built, which was thrice the height and breadth of thofe he had lately loft. When the work was firifhed, he caufed the engine to be placed near the poit, which he was refolved, at all adventures, to furce. But as it was upon the point of entering the harbour, a dreadful itormarifing, drove it againtt the fhore, with the veffels on which it had been reared. The befieged, who were attentive to improve all favourable conjunctures, while the tempelt was till raging, made a fally aganft thofe who defended the eninence mentioned abore; and, though repu'fed feveral times, carricd it at iaft, obliging the Demetrians, to the number of 400 , to throw down their arms and fubmit. After this vietory gained by the Rhodians, there arsived to their aid 250 Gnof. fians, and 500 men fent by Ptolemy from Egypt, molt Vol. XYI.
of them being natives of Rhodes, who had ferved among the king's tronps.

Demetrius being cxtremely mortified to fee all his batteries againt the harbour rendered inefiectual, re-
folved to employ them by land, in hopes of carrying
r2 the city by alfault, or at leaf reducing it to the ne-Demetris ceffity of capitulating. With this view, having got framesa together a valt quantity of timber and other mate. newnarials, he framed the famous engine called helepolis, chiue callest which was by many degrees larger than any that had ever been invented before. Its balis was fquare, each fide being in length near 50 cubits, and made up of fquare pieces of timber, bound together with plates of iron. In the middle part he placed thick planks, aboue a cubit diftant from each other; and on thefe the men were to fland who forced the engine forward. The whole was moved upon eight frong and large wheels whofe felloes were Atrengthened with Atror.g iron plates. In o:der to facilitate and vary the movements of the helepolis, cafters were placed under it, whereby it was turned in an inflant to what fide the workmen and engineers pleafed. From each of the four angles a large pillar of wood was carried to about the height of 100 eubits, and inclining to each other ; the whole machine confilting of nine fories, whole dimenfions gradually leffened in the afcent. The firlt flory was fupported by 43 beams, and the laft by no more than nine. Three fides of the machine were plated over with iron, to prevent its being damaged by the fire that might be thrown from the city. In the front of each ftory were windows of the fame fize and fhape as the engines that were to be difcharged from thence. To each window were fhutters, to draw up for the defence of thofe who managed the machines, and to deaden the force of the ftones thrown by the enemy, the fhutters being convered with fkins Ituffed with wool. Every flory was furnifhed with two large faircafes, that whatever was neceflary might be brought up by one, while others were going down by the other, and fo every thing might be difpatched without tumult or confufion. This huge machine was moved forwards by 3000 of the ftrongelt men of the whole army; but the art with which it was built greatly facilitated the motion. Demetrius caufed likewife to be made feveral teftudoes or pent-houfes, to cover his men while they advanced to fill up the trenches and ditches; and invented a new fort of galleries, through which thofe who were emplojed at the fiege might pafs and repafs at their pleafure, without the laat danger. He employed all his feamen in leveiling the ground over which the machines were to be brought up to the fpace of four furlongs. The number of workmen who were employed on this occafion amounted to 30,000 .

In the mean time, the Rhodians, oblerving theie The Rho. formidable preparations, were bufy in raifing a new dians raif wall within that which the enemy intended to batter ${ }^{2}$ new wall, with the helepolis. In order to accomplifh this work, they pulled down the wall whicl furrounded the theatre, fome reighbouring houfes, and even fome temples, after having folemnly promifed to build more maguifcent aructures in honour of the gods, if the city were preferved. At the fame time, they fent out nine of their befl flips to feize fuch of the enemy's refiels as they coald meet with, and thereby diftreis then for

 :1. I font as a pacient to her lutbat Demetrius, ace ormparied sth a letter whiten with lear own hand. "lice Rlodians font the furniture, the soyal robe, and csent the letier, to P'olemy; which exafperated Demetrita th a great degree.

IVhie Denctius was preparing to atack the city, the Rhodians laving affembled the people and magifirates to e nfult about the meafures they fhould take, forne properid in the afiembly the pulling down of the flatucs of Antigonus and his fon Denietriue, which tiil ihen had been held in the utmoft veneration. But this prepofnl was generally rejected with indignation, and their pruclent condtin greatly allayed the wrath both of Antigorus and Demetrius. However, the iattor continued to carry on the fiege with the utmoft vizour, thinking it would reflea no imall difhonour on hine were l:e obiged to quit the place without making himfeli matter of it . He caufed the walls to
ard the mandines played off in of brifk a manmer, that a larte tower buit with fquare llones, and the wall that tlanked it, were battored down. The belicged, nevestlaclef, forght in the breachs with fo much courage and refolution, tiat the emmy. atter various unfuccelsful attentr, vere forecd to abanderi the enterprife, and retine.

Ia this conjuncture, a ? cet which Polemy had The hefreighted with 300,000 mewhres of eurn, and diffe-ficedrerent kinds of pulle for the whe of the Rhooians, arrived very feafonably in the post, nothwithfanding the virilance of the cromy's fhipe, which eruized on the coalls of the ifland to furprife them. A few days after came in fife two other flects, one fent by Caffander, with, Ico,oco buthels of balley; the other by Lyfinachus, with 400,000 buficls of corn and as nany of barley. This fonfonable and plentifnl fupply arriving when the city began to fuffer for want of provifions, inpired the belieged with new courage, and raifed their drooping fpirits. Being thus animated they formed a defign of fetting the enemy's engines en fire; and with this view orderes a body of men io fally cut the night erfuing, about the fecond watel, with torches and fuebrands, having firft placed on the walls an incredible number of engines, to difcharge fones, arrows, darts, and fire-balls, againft thafe who thould attempt to oppofe their detacliment. The Rhodian troops, purfuant to their orders, all on a fudden fallied out, and advancing, in fpite of all oppofition, to the batteries, fet them on fire, while the engines from the walls played incelfantly on thofe who endeavonred to extinguilh the flames. The Demetrians on this necafon fell in great numbers, being incapable, in the darknefs of the night, cither to fee the engines that continually difcharged fhowers of ftones and arrows upon them, or to join in one body and repulfe the enemy. The confitgration was fo great, that feveral plate of iron falling from the helepolis, that vaft engine would have been entirely confumed, had not the troops that were ftaw tioned in it with all ponible fpeed quenched the fire with watcr, before prepared, and ready in the apartments of the ergine againft fuch accidents. Demeilius, fearing left all his machines thould be confumed, called togelher, by found of trumpet, thofe whofe pro. vince it was to move them ; and, ly their help, brought them off before they were entirely deftroyed. When it was day, he commanded all the darts and arrows that had been fhot by the Rhodians to be carefully gatherel, that he might from their number form fome judge. ment of the number of machines in the city. Above 800 firebrands were found on the fpot, and no fewer than 1500 darts, all difcharged in: a very fmall portion of the night. This Aruck the prince himfelf with no fmall terror; for he never imagined that they would have been able io bear the charges of fuch formidabie preparations. Iowevet, after having caufed the flain in be buried, and given dircctions for the euring of the weunded, he applied himfelf to the repairing of his machinec, which had becr difmounted and rendered quie uniervicuable.

In the mean time, the befieged, improving the refpite They build allowed ti em by the semovid of the machimes, built a thind wath in the form of a crefcent, which trok in al that part llat was moft expofid to the enemy's baticaies; and, befowes, suev: at deep tromeh behind the

Rhoder. ceive a laree fupply of provifions, and fet the llemy's engives on firc.
to fail, a delerer very ofportunely gave notice of the whiole io the townfmen; who having, with all expewitica, brawn a decp trench all along the wall, began to countermine, and, meeting the enemy under ground, nhi ged them to abandon the work. While botl parlies gatarded the mines, one Athenagoras a Milelian, who ! tad bcen fent to the affifance of the Rhodians by liolemy with a body of mescenaries, promifed to beTray the city to the Demetrians, and let them in thro, the mines in the right-time. But this was onity in frder to enfnare them; for Alexander, a noble Macedonian, whom Demetrius had fent witl a cloice body of troops to take poffefion of a polt agreed ch, no foorer appeared, but he was taken prifoner by the Lhedians, who were waiting for him under arms.Athenagoras was crowned by the fenate with a crown of gold, and prefented with five talenis of filver.
I) emerrius now gave over all thoughts of undermiring the walls, and placed all his hopes of reducing the city in the batterirg-engires which he had contrived. Having therefore levelled the ground under the tralls, he brongit np his helepolis, with four tefiudceson each fide of it. Two nther telludnes of an \&stuaordinary fize, bearing baitering-rams, were likewife moved forwards by icoo men. Lach ftory of the helepolis was filled with all forts of engines for difcharring of fores, arrous, and darts. When all thitgs were ready, Demetrius ordered the fignal to be given; when his mon, fetting up a flout, allaulted the city en all fides both by fea and land. But, in Whe heat of the attack, when the walls were ready to fall by the supeated Arches of the batterir ह-rams, ambatladors arrived from Cnidus, earnelly fuliciting Demethius to furfond all further honilities, and at the fame time giving lim depes that they fhonld prewil byon the Rhodians to fiubnit to an honourable capirulation. A firfecifion of armas was accordingly agreed on, and ambatiadors font from beth lides. But the Whediars refuifg to cepibulate on the coudit:ons ofbred tham, the attact: was soncwed with to raticl firy,

## R H O

Lumetr.us makes a breach in the walis, but is fill repulfed.
breach, to ptevent the enemy from entering the city that way. At the fame time, they detached a iquadron of their beft thips, under the command of Amyntas, who made over to the continent of Afia; and there meeting with fome privateers who were comnifioned by Demetrins, took both the Thips and the mea, among whom were Timocles the chiet of the pirates, and feveral other ollicers of diltindtion belonging to the fleet of Demetrius. On their return, they fell in with fevewal veffels laden with corn for the enemy's camp, which they likewife took, and brought into the port. Thefe were foon followed by a numerous fleet of fmall velfels loaded with corn and provifions fent them by Ptolemy, together with 1500 men, commanded by Antigonus a Macedonian of great experience in military attairs. Demetrius, in the mean time, having repaired his machines, brought them up anew to the walls; which he inceffantly battered till he opened a great breach and threw down feveral towers. But when he came to the alfault, the Rhodians, under the command of Aminias, defended themfelves with fuch refolution and intrepidity, that he was in three fucceflive attacks repulfed with great flaughter, and at lalt forced to retire. The Rhodians likewife, on this occafion, loft feveral off. cers; and amongtt others, the brave Aminias their commander.

While the Rhodians were thus fignalizing themfelves in the defence of their conntry, a fecond embalfy arrived at the camp of Demetrius from Athens and the other cities of Greece, foliciting Demetrius to compole matters, and ftrike up a peace with the Rhodians. At the requelt of the ambaffadors, who were in all above 50 , a $c \in f a t i o n$ of arms was agreed upun; but the terms offered by Demetrius being anew rejected by the Rhodians, the ambaffadors returned home without being able to bring the contending parties to an agreement. Hoftilities were therefore renewed; and Demetrius, whofe imagination was fertile in expedients for fucceeding in his projects, formed a detachment of 1500 of his beft troops, under the conduct of Alcimus and Mancins, two officers of great refolution and experience, ordering them to enter the breach at mid-
8y night, and, forcing the entrenchment behind it, to pof. His troops feis themfelves of the polts about the theatre, where it enter the brach;
would be no difficult matter to maintain themfelves againf any efforts of the townfmen. In urder to $f_{d}$ cilitate the execution of fo important and dangerous an undertaking, and amufe the encmy with falie attacks, he at the fame time, upon a fignal given, ordered the reft of the army to fet up a fhout, and attack the city on all fides both by fed and land. By this means $h=$ hoped that, the belieged being alarmed in all parts, his detachment might find an opporturity of forcing the entrenchments which covered the breach, and atterwards of feizing the advantageons polt about the theatre. This feint had all the fuccefs the prince could expect; for the troops having fet up a thout from all quarters, as if they were advancing to a general aflault, the detachment commanded by Alcimus and Mancius entered the breach, and fell upon thofe who defended the ditch, and the wall that covered it, with fith vigour, that, having flain the mon part of them and put the rell in confufion, they advanced to the theatre, and feized on the polt adjuining to it. This secafioned a gencral uproar in the city as if it had been
already taken ; but the commanding oficers difpatched orders to the foldiers on the ramparts nut to quit their Fols, nor ftir from their refpeftive tations. Having thus fecured the walls, they put themelres at the liead of a choren body of their own troops, and of thole who were lately come from Egypt, and with thefe charged the enemy's detachment. But the darknefs of the night prevented them from diflodgins the enemy and regaining the advantageous poits they had leized. D)dy, however, to fooner appeared, than they renewad the. attack with wonderful bravery. The Demetrians witl. out the walls, with loud houts endeavoured to animato thofe who bad entered the place, and infpire them with retolution to maintain their ground till they were relieved with frefh troops. The Rhodians being ferrfible that their fortunes, liberties, and ail that was ceir to them in the world, lay at ftake, faght like men i:m the utmof defpair, the enemy detending their polts fur feveral hours without giving ground in the lealt. At length the Rhodians, encouraging each other to exert themfelves in defence of their country, and animated by the example of their leaders, made a laft effort, and, breaking into the very heart of the enemy's battalion, there killed both their commanders. After their death, the reft were ealily put in diforder, and all to a man either killed or taken prifoners. The Rhodians like- lilled or wife on this occafion loft many of their be!t commanders; and among the ref Damotetis, their chief magiAtrate, a man of extraordinary valour, "who had fignali. zed himfelf during the whole time of the fiege.

Demetrius, not at all difcouraged by this check, was making the necelfary preparations for a new affalt, when he received letters from his father Antigonus, enjoining him to conclude a peace with the Rhodians upun the beft terms he could get, left he fould lofe his whule army in the frege of a fingle town. From this time Demetrius wanted only fome plaufible pretence for breaking up the fiege. The Rhodians likewife were now more inclined to come to an agreement than formelly; Ptolemy having acquanted them that he intended to fend a great quantity of corn, and 5000 men to their affifance, but that he would firf have them try whether they could make up matters with $\mathrm{De}_{2}$. metrius upon reafonable terms. At the fame time ambaffadors arrived from the Ætolian republic, foliciting the contending parties to put an end to the war which might involve all the eatt in endlefs calamitics.

An accident which happened io Demetrins in this conjuncture, did not a little contribute towards the withed-for facification. This prince was preparing to polis renadvance his helepolis amain advance his helepolis againtt the city, when a Rhodian lefs. engineer found means to render it quite ufelefs. Ho undermined the tract of ground over which the helepolis was to pals the next day in order to approach the walls. Demetrius, not fufpecting any ftratagem of this nature, caufed the engine to be moved formard, which coming th the place that was undermined, funk fo deep into the ground that it was impollible to draw it ont again. This misfortune, if we believe Vegetius and Vitruvius, determined Demetrius to hearken to the Etolian am;balfadors, and at latl to Atrike up a peace upon the fol. lowing conditions: That the republic of Rhodes Mould be maintained in the full enjoyment of eheir ancient The liete rights, privileges, and lioerties, without any foreign raifud. garaifon; that they fhould remew tieir ancient alliance

Ft $d$ e. whim Antignme, anal atit him in lis wars againft all res Alucs and pri ice e ercept l't lemy king of Eigypt; and tha', fur the effic? hated between them, they thould deliver 100 hoftages, duch as Demetrius thould nake choice of, except thofe who bare any public employment.

Thas was the fiege raited, after it had continucd a whole year; and the Rhodims amply rewarded all thofe who had diftinguifhed themfelves in the fervice of their conntry. They alio fer up itatues to Polemy, Cuni.nder, and Lyfimachus; to all of whom they paid the highelt honours, efpecially to the firft, whom they worflipped as a god. Demetrius at his departure prefented them with the helepolis, and all the other maclines which he had eniployed in battering the city; from the fale of which, with fome additional fums of their own, they erected the famous coloflus. After this they arplied themfives eatirely to trade and navigation; by which means they became quite mafters of the fea, and much more opulent than any of the neighbouring nations. As far as lay in their power, they endeavoured to preferve a neutrality with regard to the jarming nations of the ealt. However, they eould not awoid a war with: the Byzantines, the occafion of which was as follows: The Byzantines being obliged to pay a yearly thibute of 80 talents to the Gauk, in order to raile this fum, they came to a refolution of laying a toll on all thips, that traded to the Pontic fea. This refolution provoked the Rhodians, who were a trading nation, above all the reft. For this reafon they immediately difpatched ambatfadors to the Byrantines, complaining of rhe now tar; but as the Byzantines had no cther method of fatisfiying the Gauls, they perfifted in their refolution. The Rtandians now declared war, and prevailed upon Prufias king of Bithynia, and Attalus king of Pergamns, to affit thens; by which confederacy the Byzantines were fo intimidated, that they agreed to exact no toll from Chips trading to the Pontic fea, the demand which had been the occafion of 24 the war.
A dreadful About this time happened a dreadful earthquake, earefquate which threw down the colofus, the arfenal, and great at Rhodes. part of the city-walls of Rhodes; which calamity the Rhodians improved to their advantage, fending ambaffid rs to all the Grecian princes and flates to whom their loffes were fo much exaggerated, that their countiymen obtained inmenfe funis of money under pretence of repairing them. Hiero king of Syracufe prefented them with 100 talents; and, befides, exempted from all tolls and dutics fuch as traded to Rhodes. Ptolemy hing of Egypt gave them 100 talents, a million of meafures of wheat, materials for building 20 quinqueremes and the like number of trixemes; and, befides, fent them 100 ar hitects, 302 workmen, and materials for repairing their public buildings, to a great value, paying them moreover $2+$ talents a-year for the maintenance of the worl:men whom he fent them. Antigonus gave them 100 talents of filver, with 10,000 pieces of timber, each fiece being 16 cubits long; ;000 plazks; 3000 pounds of iron, as many of pitch and refin, and 1000 meafures of tar. Chryfeis, at woman of dillinction, fent them 100,000 meafures of wheat, and 3050 pounds of lead. Antiachus exempted from all taxes and duties the Rhodian llips trading to his dominions; prefented thems with 10 gralleys, and 200,000
mafures of com, with many other thinss of great value. Pruflas, Mithridates, and all the princes then reigning in Afia, made them proportionable, prefents: in flort, all the Greek towns and nations, all the princes of Europe and Alia, contributed, according to their ability, to the relief of the Rhodians on that oceafion; infomuch that their city not only foon rofe from its ruins, but attained to an higher pitch of fplendor than ever.

In the year $20: 3$ B. C. the Rhodians engaged in a war with Philip of Macedon. This monarch had inva ded the territories of Attalus king of Pergamus; and bec:aufe the Rhodians feemed to favour their ancient friend, fent one Heraclides, by birth a Tarentine, to fet fire to their flect; at the fame time that he difpatched ambaffadors into Ciete, in order to flir up the Cretans againlt the Rhodians, and prevent them from fending any affifance to Attalus. Upon this war was immediately prochamed. Plilip at firft gained an inconfiderable advantage in a naval engagement; but the next year was defeated with the lofs of 11,000 men, while the Rhodians loft but 60 nien and Attalus 70. After this he carefully avoided coming to an engage. ment at fea either with Attalus or the Rhodians. The combined fleet, in the mean time, failed towards the ifland of Agina in hopes of intercepting him : but having failed in their purpofe, they failed to Athens, where they concluded a treaty with that people; and, on their return, drew all the Cyclades into a confederacy againf Philip. But while the allies were thus watting their time in negociations, Philip, having divided has forces into two b idics, fent one, under the command of Philucles, to ravage the Athenian territories; and put the other ab ard his fleet, with orders to fail to Meronea, a city on the north fide of Thrace. He then marehed towards that city himfelf with a body of forces, took it by affault, and reduced a great many others; fo that the confederates would, in all probability, have had little reafon to boalt of their fuccefs, had not the Romans come to their affiftance, by whofe help the war was foon terminated to their advantage. In the war which took place between the Romans and Antiochus the Great king of Syria, the Rhodians were very ufeful allies to the former. The beft part of their Heet was indeed deftroyed by a treacherous contrivance of Polyxeniades the Syrian admiral ; but they foon fitted out another, and defcated a Syriaa fquadron commanded by the celebrated Hannibal, the Carthaginian commander ; after which, in conjunction with the Romans, they utterly defeated the whole Syrian fleet commanded by Poly yeniades; which, ingether with the lofs of the battle of Magnefia, fo difpirited Autiochus, that he fubmitted to whatever condutions the Romans pleafed.

For thefe fervices the Rhodians were rewarded with the provinces of Lycia and Caria; but tyramizing over the people in a terrible manner, the Lycians applied to the Romans for protestion. This was readily granted; but the Rhodians were fo much difpleafed with their interfering in this matter, that they fecretly favoured Perfes in the war which broke out between him and the Roman republic. For this offence the two provinces abnvementioned were taken from them; but the Rhodiutns, having banifhed or put to death thofe who had favoared Perfes, were again admitted into fa

Rhodes be-
ficged by Mithridates with
cut fuscefs.
vour, and greatly honoured by the fenate. In the Mithridatic war, their alliance with Rome brought upon them the king of Pontus with all his force; but having lolt the greatelt part of his fleet before the city, he was obliged to raife the fiege without performing any re. markable exploit. In the war which Pompey made on the Cilician pirates, the Rhodians aflifted him with all their naval force, and had a great thare in the victories which he gained. In the civil war between Cæfar and Pompey, they affifted the latter with a very numerous fleet. After his death they fided with Crfar ; which drew upon them the refentment of C. Caflius, who advanced to the illands of Rhodes with a powerful fleet, alter having reduced the greateft part of the continent. The Rhodians, terrified at his approach, fent ambafo fadors intreating him to make up matters in an amicable manner, and promifing to ftand neuter, and recal the dhips which they had fent to the afiftance of the triumviri. Caffius infilted upon their delivering up their fleet to him, and putting him in poffelfion both of their harbour and city. This demand the Rhodians would by no means comply with, and therefore began to put themfelves in a condition to fand a fiege; but firf fent Archelaus, who had taught Callius the Greek tongue while he ftudied at Rhodes, to intercede with his difciple in their behalf. Archelaus could not, with all his authority, prevail upon him to moderate his demands wherefore the Rhodians, having created one Alexander a bold and enterprifing man, their prætor or prytanis, equipped a fleet of 33 fail, and fent it out under the command of Mnafeus, an experienced fea-officer, to of. fer Callius battle. Both fleets fought with incredible bravery, and the victory was long doubtful: but the Rhodians, being at length overpowered by numbers, were forced to return with their fleet to Rhodes; two of thcir flips being funk, and the reft vel y much damaged by the heavy thips of the Romans. This was the firf time, as our author obferves, that the Rhodians were tairly overconne in a fea-ñght.

Caflius, who had beheld this fight from a neighbour. ing hill, having refitted his fleet, which had been no lels damagred than that of the Rhodians, repaired to Loryma, a frons hold on the continent belonging to the Rhodians. This cafte he took by aftault ; and from hence conveyed his land-forces, under the conduct of Fannius and Lentulus, over into the illand. His fleet confilled of 80 hlips of war and above 200 trimfports. The Rhodians no fooner faw this mighty fleet appear, but they went ont again to miet the enemy. The fecond engagement was far more bloody that the firt ; many thips were funk, and great numbers of men killed en both fides. But victory anew declaved for the liomans; who immediately blocked up the city of Rhodes both by fea and land. As the Rhodians had not had time to furnilh the city with fufficient fore of provifions, fome of the inhabitants, fearing that if it were taken either by affault or by famine, Caflius would put all the inhabitants to the fivord, as Brutus had Who takes iately done at Xanthus, privately opened the gate to Who cakes him, and put him in poffeffion of the town, which he pillages the neverthelefs treated as if it had been taken by affault. city.

He commanded 50 of the chief citizens, who were fufpected to favour the adverfe party, to be brought before him, and fentenced them all to die; others, to the number of 25 , who had commanded the fleet or army
becaufe they did not appear when fummoned, he pro fcribed. Iiaving thus punifhed fuch as had either acted or fpoken againft him or his party, he commanded the Rhodians to deliver up to him all their fhips, and whatever money they had in the public treafury. He then plundered the temples; Aripping them of all their valuable furniture, veffels, and ftatues. He is faid not to have left one flatue in the whole city, except that of the fun; bragging at his departure, that he lidd Atripped the Rhodians of all they had, leaving them nothing but the fun. As to private perfons, he commanded them, under fevere penalties, to bring to him all the gold and filver they liad, promifing by a public crier, a tenth part to fuch as hould difcover any hidden trea. fures. The Rhodians at firt concealed fome part of their wealth, imagining that Caffius intended by this proclamation only to terrify them; but when they found he was in earnelt, and feveral wealthy citizens put to death for concealing only a fmall portion of their riches, they defired that the time prefixed for the bringing in their gold and filver might be prolonged. Caffius willingly granted them their requeft ; and then through fear they dug up what they had hid under ground, and laid at his feet all they were worth in the world. By this means he extorted from private perfons above 8000 talents. He then fined the city in 500 more ; and leaving L. Varus there with a ftrong garrifon to exact the fine without any abatement, he returned to the continent.

After the death of Caflius, Marc Antony reftored the Rhodians to their ancient rights and privileges; beltowing upon them the illands of Andros, Naxos, Tenos, and the city of Myndus. But thefe the Rhodians fo oppreffed and loaded with taxes, that the fame Antony, though a great friend to the Rhodian republic, was obliged to divent her of the fovereignty over thofe places, which he had a little before fo liberally beltowed, upon her. From this time till the reign of the Emperor Claudius we find no mention made of the Rhodians. That prince, as Dion informs us, deprived them of their liberty for having crucified fome Roman citizens. However, he foon reflored them to their former condition, as we read in Suetonius and Tacitus. The latter adds, that they had been as often deprived of, as reltored to, their liberty by way of punifhnsent or reward for their different behaviour, as they had obliged the Romans with their a fiftance in foreign wars, or provoked them with their feditions at home. Pliny who wrote in the beginning of Vefpafian's rcign, Atyles Rhodes a leautifuland fiee town. Bnt this liberty they did not long enjoy, the inand being foon after reduced by the fame Vetpafian to a Roman province, and obliged to pay a yearly tribute to their new malters. This province was called the province of the illan's. The Roman pretor who govesned it relided at Rhodes, as the chief city undc: his jurifdiction; and Rome, notwithflanding the eminent fervices rendered her by this republic, thenceforth treated the Rhodians not as allies, but vaffils.

The illand of Rhodes continued fubject to the Ro- tions of mans till the reign of the emperor Andronicus; when Villaret, grand-mafler of the knights of Jerufalem, then refiding in Cyprus, finding himelf much expofed to the attacks of the Saracens in that inland, refolved to exchange it for that of Rhodes. The iNand too was

## R H O

R'inies. $\underbrace{\text { Rinies. }}$ amot entisely accupied by the Saratens: Andronicus caltle. Neverthelets he refuled to irrant the inveltitue of the illand to Villaset. Tie later, without peandis tinse in fruitels nergociations, fated direety dir R!ndes, where he landed his troops, provilions, and warlike trares, in fite of the oppolition made by the Saracons, who then unied agniatt the common enemy. As Viburet lorefuw that the capionl mutt be take: before he could reduce the intand, he inltanily laid liege to it. The inhabiants delended themfelves oblinately, upon which the grand-mafter thought proper to turn the fiege into a blocisade; but he foon found himfelf fo clutely furrom dod by the Grecks and Sameens, that he could get no fupply either of forage or provilions

St Nicholas, which, in the former fiege by Mohammed, had refifted all the efforts of the then grand-visies: This the bathaw of Romania caufed to be battered with 12 large pizees of brals camon, but had the mortifica. berribly tion to fee then all difmomed by thofe of the tower; to prevers which in future, he ordered them to be fired only in the night, and in the day had them coversd with gabions and eath. 'This had duch fuccels, that, after 500 cannon-hhot, the well began to thake and tumble into the ditel! ; but he wis furprifed to find another wall behind it, well terraced, and burtered with artillery, and himfelf obliged either to begin afreff or give up the cntcrerife: and yet this laft was what Solyman preterred, when he was rold of its being built oa a hard rock, incapable of being fapped, and how firmly it had held out againit all the efforts of Mohammed's vizier. The next attack was therefore ordered by him to be made againg the baltions of the town, and that with a vatt number of the largeft artillery, which contimued firing duriag a whole month; to that the new wall of the baltion of England was quite demolifhed, thongh the old one flood proof againtt all their thot. That of Italy, which was battered by 17 large pieces of cannon, was Atill worfe damaged ; upon which Martinengo the engineer advifed the grand-matter to caute a fally to be made on the trenches of the enemy out of the breach, whillt he was making frefh entrenshments behind it. His advice lucceeded; and the 200 men that fallied out fword in hand having furprifed the Turks in the trench, cut moll of them in pieces. At the fame time a new detachment, which was fent to repulfe them, being obliged, as that engineer rightly judged, to pals by a fot which lay open to their artillery, were likewife moltly deftroyed by the continual fire that came frora it, whilt the alfalants were employed in fulling up feveral fathons of the trench before they retired. By that time the breach had been repaired with fuch new works, that all the efforts to mount it by allault proved equally ineffectual and deAtructive.

Unfortunately for the befieged, the continual fire The befiethey had made caufed fuch confumption of their pow- ged wal:t der, that they began to feel the want of it ; the per-puwder, hidious d'Anarald, whole province it had been to rilit but find the magazines of it, having amuled the council with fupuly the a falle report, that there was more than fulficient to defect. maintain the fiege, though it flould latt a whole twolve month. But here the grand-mater found means to fupply in fome mafure that unexpected defect, by the cutious provifion he had made of a latge quantity of faltpetre, which was immediately ground and made into gunpowder, though he was at the fame time obliged to urder the engineers to be more fparing of it for the future, and to make ufe ofit only in the defence of fuch breaches as the enemy thould make.

All this while the Turks had not ganed an inch of Delperate gromed; and the breaches they had made were folide encounters denly either repaired or defended by new entren:bments, in mines, that the very rubbilh of them mat be mounted by af: dico $^{2}$
fault. Solyman, therefore, thought it now advilable to let his numerous picneers at work, in five different parts, in digging of mines, each of which led to the baltion oppolite to it. Some of thefe were counterminal by a new invented methos of Darinengo ; who by the r.c!p of braced lains, or drums, could dofcover

## R H O

perceived, whirh he caufed to be opened, and the mi. ners to be driven out by hand grenadoes; others to be fmothered, or burned, by fetting fire to gunpowder. Yet did not this hinder two confiderable ones to be rprung, which did a vaft deal of damage to the baftion of England, by throwing down about fix fathoms of the wall, and filling up the ditch with its rubbith: whercupon the Turks immediately climbed up fivord in hand to the tep of it, and planted feven of their fandards upon the parapet; but being fopped by a traverfe, the knights, recovering from their furprife, fell upon them with fuch fury, that they were obliged to abandon it with great lofs. The grand-mater, who was then at church, quickly came to the place with his fhort pike in his hand, attended by his knights, encouraging all he met with, burghers, foldiers, and others, to fight bravely in defence of their religion and country, and arrived time enough to affift in the taking down their fandards, and driving down the enemy by the way they came up. In vain did the virier Muftapha endeavour to prevent their flight by killing fome of the foremuft with his fword, and driving the reft back ; they were obliged to abandon the baftion, and, which was fill worfe, met with that death in their flight, which they had frove to fhun from the fire-arms which were difcharged upon them from the famparts. Three fangiacs lof their lives in this attack, befides fome thoulands of the Turks; the g:andmafter, on his fide, lof fume of his braveft knights, particularly his ftandard-bearer.

The attacks were almof daily renewed with the fame ill fucecfs and lofs of men, every general friving to fignalize himfelf in the fight of his emperor. At length the old general Peri, or Pyrrus, having haraffed the troops which guarded the baftion of Italy for feveral days fucceflively without intermifion, caufed a ftrong detachment, which he had kept concealed behind a cavalier, to mount the place by break of day, on the 3 th of September; where, finding them overcome with fieep and fatigue, they cut the throats of the fentinels, and, fliding through the breach, were juft going to fail upon them. The Italians, however, quickly recovered themfelves and their arms, and gave them an obftinate repulfe. The conteft was fierce and bloody on bo:h fides; and the bafhaw fill fupplying his own with new reinforcements, would hardly have failed of overpowering the other, had not the grand-mafter, whom the alarm had quickly reached, timely intervened, and, by his prefence, as well as example, revived his Khodians, and thrown a fudden panic among the enemy. Pyrrus, defirous to do fomething to wipe of the dif. grace of this repulfe, tried his fortune next on an adjoining work, lately raifed by the grand-mafter Carettii : Lut here his fuldiers met with a itill worfe treatment, Lsing almoft overwhelmed with the hand-grenadoes, melted pitch, and boiling oil, which came pouring upen them, whilft the forces which were on the adjacent flanks nade as great a flaughter of thofe that fied ; infomuch that the janifaries began to refume their old murmuring tone, and cry ont that they were brought thither only to be flaughtered.

The grand vizier Muftapha, afraid left their comphints thould reach his mafter, agreed at length, as the laft refori, to make a frcha astempt on the baftion
of England, whill, to caufe a diverion, the banaw Rhocies. Ahmod fprung fome frefh mines at an oppofite part of the city. 'Ihis was according executed on the $1 \%$ th of Sieptember; when the former, at the head of five battaiions, refolutely mounted or rather crept up the breach, and, in $f_{\mathrm{p}} \mathrm{ite}$ of the fire of the Englifh, adivanced fo far as to pitch fome flandards on the top; when, on a fudden, a crowd of Englifh knights, commanded by one Bouk, or Burk, fallied ont of their entrenchments, and, afifted by fome other officcrs of diftinction, obliged them to retire, though in good order. Muftapha, provoked at it, led them back, and killed feveral knights with his own hand; and had his men fupported him as they ought, the place muft have been yielded to him: but the fire which was made from the adjacent batteries and muketry difconeerted them to fuch a degree, that neither threats nor entreaties could prevent their abandoning the enterprife, and dragging him away with them by main force. The Khodians loft in that action feveral brave knights, bath Englifh and German ; and, in particular, Jolin Burk, their va. liant commander: but the ' Turks loft above 3000 men , befides many officers of diftinction. Much the fame ill fuccefs having attended Ahmed with his mines, one of which had bcen opened, and the other only b:inging fome fathoms of the wall down, he was alfo obliged to retreat; his troops, though fome of the very beft, being forced to difperfe themfelves, after having borne the fire and fury of the Spanifh and Auvergnian knights as long as they were able.

By this time Solymar, afhamed and exafperated at his ill fuccefs, called a general council; in which hemade fome finging reflections on his vizier, for having reprefented the reduction of Rhodes as a very eafy enterprife. To avoid the effects of the fultan's refentment, the fubtle Muftapha declared, that hitherto they had fought the enemy as it were upon cqual terms, as if they had been afraid of taking an ungenerous advan. tage of their fuperiority, by which, faid he, we have given them an opportunity of oppoling us with thieiunited force wherever we attacked them. But let us now refolve upon a general affault on feveral fides of the town; and fee what a poor defence their frength, thus divided, will be able to male againft our united force. The advice was immediately approved by all, and the time appointed for the execution of it was on the 24 th of that month, and every thing was ordered to be got ready againft that day. Accordingly the town was actually affaulted at four different parts, after having fuffered a continual fire for fome time from their artillery in order to widen the breaches; by which the grand-mafter eafily underfood their defign, and that praces at the baftions of England and Spain, the Pof Prot once.保 vence, and Terrace o? Italy, were pitched upon for the affault, and took his precautions accordingls.

The morning was no fooner come, than each party mounted their refpective breach with an undaunted bravery, the young finltan, to animate them the more, having ordered his throne to be reared on an eminence, whence he could fee all that was done. The Rhodians, on the other hand, were no lefs diligent in repulfing them with their cannon and uther fire-arms, with their melted lead, boiling oil, Aink-pots, and other ufual expedients. The orie fide afcend the faling ladders, fearlefs of all that oppofed them; the other overturn

## R H O

Rlodec, their ladlers and fend them tumbling down headlong info the ditches, where they were overwhelmed with Itoucs or dipatched with darts and other millile weap.ns. The baltion of England proves the feene of the greateft haugloter and blondihed; and che grand-mafter makes that his poll of honour, and, by his prefence and example, inlpires his men with freth vigour and bravery, whilt the continual thunder of his ar illery makes fuch horrid work among the aftilants as chills all their courage, and forces them to give way: the lieutenant-general, who commands the attack, leads them back with freth vigour, and mounts the breach at the head of all; immediately after comes a carnonball frem the Spanilh baftion, which overturns him dead into the ditch. This difafter, inftead of fear and dread, fills them with a furious defire of revenging his death : but all their obltinacy cannot make the Rho dians go one fep back, whilf the prielts, monks, young men and old, and even women of every r.ink and age, afilit them with an uncommon ardour and firmnets; fome in overwhelming the en my with flones; others in deftruying them with melted le dd, lulphur, and other comburtibles; and a third fort in fupplying the combatants with bread, wine, and other refreth. ments.

The affult was no lefs dcfperate and bloody on the baftion of Spain, where the knights, who guarded it, not expecting to be fo foon attacked, and afhamed to fland idle, were affifting the battion of Italy; which gave the Turks an opportunity to mount the breach and penetrate as far as their intrenchments, where they planted no lefs than 30 of their flandards on them. The grand-malter was quickly apprifed of it, and ordered the baltion of Auvergne to play again them; which was done with finch diligence, and fuch continual fire, whilt the Rhodians enter the ballion by the help of their cafemates, and, fword in hand, fall upon them with equal fury, that the Turks alike befet by the fire of the artillery and the arms of the Rhodian knights, were forced to abandon the place with a confiderable lofs. The aga with great bravery rallies them afreth, and brings them back, by which time the grand matter likewife appeared. The fight was renewed with greater fiercenefs; and fuch flaugther was made on both fides that the grand-matter was obliged to draw 202 men out of St Nicholas tower to his affiftance; thefe were commanded by fome Roman knights, who led them on with fuch fpecd and bravery, that their very appearance on the battion made the janiffaries draw back; which $S$ lyman obferving from his eminence, caufed a retreat to be founded, to conceal the diffrace of their fight. In thefe attacks there foll about 15,000 of his bett troops, befides feveral efficers of dillinction. The lofs of the lefieged was no is's confiderable, if we judge from the fmall number of their forces; thet the greatelt of all to them was that of fome of their bravelt and molt diftingnifhed knights and commanders, many of whom were killed, and icarce any cicaped nuwounded. But the moft dreadful fate of all had like to have fallen on the favnur te vizier Multal h:t, who had ropofed this general affalt : the ill fucceefs of whin had fo enraged the proud fultan, that he condemned him to be fhot with arrows at the head of his army ; which dreadful fentence was jult ready to be executed, when the old bathaw, by his intreaties, obtained a fufienfion
of it, in hopes that when his fury was abated, he flould alfo obtain his pardon.
Solyman, however was fo difeouraged by his ill fuc. ccifes, that he was on the point of railing the fiege, and would have attually done fo, had he not been divertedfrom it by the advice which he received from an Albimian deferter, fome fay by a letter from the traitor d'Amarald, that the far greater part of the knights were either hilled or wounded, and thofe that remained altogether incapable of fultaining a freth affault. This having determined him to try his fortune once more, the command of his forces was turned over to the bathaw Achmed; and, to thow that he defigned not to ftir till he was malter of the place, he ordeied a houfe to be built on the adjacent mount Philermo for his winter-quarters. Achmed merched direfly againft the baftion of Spain, which had fuffered the moft; whore, before he could open the trenclies, his men fell thick and threefold by the conttant fire both of fmall and great guns from the battion of Auvergne. He loft itill a much greater num er in rearing a rampart of earth to cover the attack, and give him an opportunity of lapping the wall ; and, as foon as he faw a large piece fall, ordered his men to mount he breach. 'Ihey were no fooner come to the top, than they found a new work and entrenchments which Martinengo had reared; and there they were welcomed with luch a brifk fire from the artillery, that they were glad to recover their trenches with the utmoft precipitation, alter having lof the much greater part of their men. The attack was renewed, and a reciprocal fire continued with great obftinacy, till a mulket-lhat diprived that indefatigable engineer of one of his eyes, and the order of his alliduous fervices for fome time. The grandmafter, having ordered him to be carried to his palace took his place, and kept it till he was quite cured, which was not till 34 days after; and continued all the time in the intrenchments with his handful of knights, farcely allowing himfelf reft night or day, and ever ready to expofe himfelf to the greaten dangers, with an ardour more becoming a junior officer than an old worn-out fovereign; which made his knights more lavifh of their own lives than their paucity and prefent circumItances could well admit of.

Soon after this, the treafon of D'Amarald was difcovered, and he was condemned to death and executed; but by this time the city was reduced to the lalt extremity. The pope, emperor, and other crowned heads, had been long and often importuned by the grand-mafter for fpeedy allittance, without fuccefs; and, as an addition to all tice other dididers, thofe fuccours which were fent to him from France and England perilhed at fea. The new fupply which he had fent for of provifions from Candia had the fame ill fate ; fo that the winds, feas, and erery thing, feened combined to bring on the deftruction of that city and order. The only refource which could be thought of, under fo difmal a fituation, was, to fend for the tew remaining knights and forees which were Ictt to guard the other illands, to come to the defence "f their capital, in hopes that, if they could fave this, the others might in time be recovered, in catc the Tuaks thould feize upon them. On the wher hand, Solyman, grown impatient at the finatigr und his getacral had granced, gave hrm exprefs orders to renew the atack with all imaginable lpeed
*hodes. and vigour, bcfore the fuccours which he afpreliended were coming from Europe, obliged him to raile the fiege. Achmed inflantly oleyed, idifed a butery of 17 large camon agant the battion of Italy, and quickly after made himielf mafter of it, obliging the $g$ er ifon to retire farther into the e:ty. Hure the grand mater was forced to demulifh two of the church.e, to prevent the eneny's feizing on them ; and, with their materials, caufed fume new worl:s and enrrenchments to de made to hinder their proceeding tarther.

The Turhs, however, gained ground every day, though they till lolt vatt numbers of their ment at length the 3 oth of $N$ vember came, when the grandmalter, and both the befiegers and befiegred, thought the lat allaule was to be given. 'Ihe bathaw Pyrras, who commanded it, led his men direatly to the entrenchments; upon which the bells of all the churches founded the alirm. The grand-mafter, and his few kniyhts, troops, and citizens ran in crowds, and in a co. fure.l diforienly manner, to the entrenchments, each fighting in his own way, or rather as his fear dircited him. This attack would have proved one of the moft defperate that hid yet been felt, had not a molt vehement rain intervened, which carried away all the earth which the enemy had reared to ferve them as a rampart againft the artillery of the battion of Auvergne ; fo that being now quite expofed to their continual fire, they fell in fuch great numbers, that the bafhaw conld no longer make them Atand their ground, but all precipitately fled towaids their camp. This latt repulfe threw the proud fultan into fuch a fury, that none of his officers dared to come near him ; and the fhame of his having now fent near fix whole months with fuch a numerous army before the place, and having lof fuch myriads of his brave troops with fo little advantage, had made him quite defperate, and they all dreaded the confecpuences of his refentment.

Pyrrus at length, having given it time to cool, ventured to approach him, and propofe a new project to him, which, if approved, could hardly fail of fuccefs; which was, to offer the town a generous capitulation; and he oblerved, that in cafe the tiubborn knights fhould reject it, yet being now reduced to fo fmall i number, as well as their forces and fortifications almoft defroyed, the citizens, who wete moft of them Greeks, and lels ambitious of gl. ry than folicitous for their own prefer. vati $n$, would undoubtedly accept of any compofition that fhould fecure to them their lives and effects.

This propofal being relifhed by the fultan, letters were immediutely difperfed about the city, in his name, exhorting them to fubmit to his governmert, and threatening them at the fame time with the moft dreadful effects of his refentment if they perfifted in their obftinacy. Pyrrus likewife difpatched a Genoefe to appreach as near as he could to the baftion of Auvergne, and to intreat the kinghts to take pity of fo many of their Chriftian brethren, and not expofe them to the dieadiul effects which mat follow their refufal of a capitulation, fo generwufly offered them at their laft extremiry. Oihcr agents were likewife employed in other places: to all of whom the grand-matter ordered fume of his men to return lhis anfwer, That his order never treated with infidels but with fword in har.d. An Albanian was fent next with a letter from tire fultan to him, who met with the fame repulfe; Vol. XVI.
after which he ordered his men to fire upon ar. $\boldsymbol{y}$ that thould prefent themfelves upon the fume pretence; which was actually donc. But this did not prevent the Rhudians form liftening to the terms offered by the Tuiks, and lolding frequent cabals up on t! at fubject; in w! ich the general mafiacie of a town taken by alliut, the dre dful flivery of thofe that efcaped, the rape of their wises and daughters, the deltmeion oi their charches, the profanation of their holy relics a:id facred utenfils, and ot: er dire confequences of an rbiti ate refutal, being duly weighed againft the fultan's offers, quickly determined them which party to take. The grand-matter, however, proving inexorable to all their intreaties, they appled to their Greek metropolitan, who readily went and reprefented all thefe things to him in the mof pathetic terms: Yet he met with no better reception; but was told, that l.e and his knights were deternined to be buried under the ruins of the city if their fwords conld no longer defend it, and he lioped their example would not permit them to fhow lefs courage on that occafion. This anfwer produced a quite contrary effect; and, as the citizens thought delay's dangerous at fuch a juncture, they came in a body to him loy the very nex: morning, and plainly told him, that if he paid no greater regard to their prefervatim, they would not fail of taking the moft proper meafures to preferve the lives and chaftity of their wives and children:

This refolution could not but greatly alarm the grand-matter; who thereupon called a council of all the knights, and informed them himfelf of the condition of the place. Thefe all agreed, particularly the engineer Martinengo, that it was no longer defenfible, and no other refource left but to accept the fultan's offers ; adding, at the fame time, that though they were all ready, according to the obligations of their order, to fight to the laft drop of their blood, set it was no lefs their duty to provide for the fafety of the inhabitants, who, not being bound by the fame obligations, onght not to be made a facrifice to their glors. It was therefore agreed, with the grand-mafter's comfent, to accept of the next offers the fultan fhould make. He did not let them rait long: for the fear he was in of a frefl fuccour from Euiope, the intrepidity of the knights, and the fhame of being forced to raife the fiege, prevailed upon him to hang out his pacific flag, which was quickly anfwered by another on the Rhodian fide; upon which the Turks, coming out of their trenches, delivered up the fultan's letter for the grandmafter, to the grand-prior of St Giles, and the engineer Martinengo. The terms offered in it by Solyman appeared to advantageous, that they imnediately exchanged hoftages; and the knights that were fent to him had the honour to he introduced to him, and to hear them confirmed by his own mouth, though not without threats of putting all to fire and fword in cafe of refufal, or even delay. Two ambaflad ors were forthwith fent to him, to demand a truce of three days to fettle the capitulation and interefts of the inhabitants, who were part Greeks and part Latins; but this was abrolutely refufed by the impatient monarch, out of a fufpicion of the rumoured fuccour teing near, and that the truce was only to gain time till it was come.

He therefore ordered the hoflilities to be renewed Ff vid

Rlode- with frefle fusy : in which the Rhodians made a molt nob'c delence, comfidering their finall number, and that they had now only the barbican or falfe bray of the battion of Spain left to defend themelves, and once more repulied the enemy: at which the fultan was to caraged, that he refolved to overpower them by numhers on the nest day: which was, after a thout deferce, to effectually done, that they were forced to abandon that outwork, and retire into the city. In the meanwhile, the burghers, who had but a day or two betore railed a frefh uproar againt the grand-mather, under pretence that he was going to give them up a piey to an infiel who regarded neither oaths nor folemn treaties, percciving thear own danger, came now to defire him to renew the negociations, and only begged the li beris of fending one of their deputies along with his, to fecure their interefts in the capitulation. He rea dily conierted to it; but gave them a clarge to fhow the buflaw Achmed the treaty formerly concluded between Bajazet and his predeceffor d'Aubuffon, in which the former had entailed a dreadful curfe on any of his fucceffors that thould infringe it. This was clone, in hopes that the thowing it to his mafter, who valued himfelf fo much upon his frict obfervance of his law, might produce fome qualm in him which might lengthen the agreement, for they were fill as much in hopes of a fuccour from Eurnpe as lee was in fear of it; but to their great furprife, Achmed had no fooner perufed than he tore it all in pieces, trampled it under his feet, and in a rage ordered them to be gone. The grand-mater found no other refource than to fend them back to him the next day; when that minifter, who knew his mafter's impatience to have the affair concluded, quickly agreed with them apon the terms, which were in fubllance as follow :

1. That the churches fhould not be profaned. 2. That the inhabitants flould not be furced to part with their children to be made janiflaries. 3. That they fhould enjoy the free exercife of their religion. 4. That they thould be free from taxes duning five years. 5. That thofe who had a mind to leave the ifland fhould have free leave to do fo. 6. That if the grand mather and buis knights had not a fufficient number of veffels to tranfport themfe!ves and their eff.ats into Candia, the fultan fhould fupply that defcet. 7. That they fhould have 12 days allowed them, from the figning of the articles, to fend all their effeets on board. 8. That they thould have the biberty of carrying away their relics, chalices, and other facred utenfils belonging to the great church of St Joln, torether with all their ornaments and other effeets 9 . That they fhould likewife cariy with thent all the artillery with which they were wont to a m the galleys of the order. 1o. That the iflands belonging to it, together with the caftle of St Peter, fhould be delisered up to the Turks. II. That, for the more eafy execution of thefe articles, the 'Turkifh army bould be removed at fome miles dillance from the eapital. 12. That the aga of the janiflaries, at the head of 4000 of his men, thould be allowed to go and take pofferfion of the place.

From the tince the ifland of Rhodes has been fubject to the Turks; and, like other countrics fuhjeet to that tyrannical yoke, has loft its former importance. The air is goont, and the foil fertile, but ill cultivated. The capital is furrounded with triple walls and double
ditches, and is looked upon to be impregnable. It is Rhodiola inhabited by Turks and Jews; the Chrifians being obliged to occupy the fuburbs, as not being allowed to Rhodudenlhay in the town during the right. The town is fituated in E. Long. 28. 25 . N. Lat. 36. 54.

RHODIOLA, rosewort, in botany: A genus of the oftandria order, belonging to the dixccia clafs of plants; and in the natural method ranking under the 13 th order, Su cul nic. The male calyx is quadripar. tite; the corolla tetrapetalous. The female calyx is quadripartite, and there is no corolla; the nectaria are four ; the pittils four ; and there are four poly'permous. capfules. There are two fpecies, the rofea and the minor: the firft grows naturally in the clefts of the rucks and rugged mountains of Wales, Yorkfhire, and Weftmoreland. It has a very thick felhy root, which when cut or bruifed fends out an odour like rofes. It has thick fucculent ftalks, like thofe of orpine, about nine inches long, clofely garnithed with thick fucculent leaves indented at the top. The falk is terminated by a cluAter of yellowifh herbaceous flowers, which have an agreeable feent, but are of fhert continuance. The fecond fort is a native of the Alps, and bas purplifh flowers which come out later than the former ; it is alfo of a fmaller fize. Both fpecies are eatily propagated by parting their roots; and require a flady fituation, and dry undunged foil. The fragrance of the firf fpecies, however, is greatly diminifled by cultivation.

## Oil of RHODiUM. See Asfahatus.

RHODODENDRON, dwarf rosebay, in botany: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 18 th order, Bicornes. The calyx is quinquepartite; the corolla funnel fhaped; the tamina decl ning; the capfule quinquelocular. There are feven fpecies: the moft remarkable of which are, I. The biriutum, with naked hairy leaves, grows naturally on the Alps and feveral mountains of Italy. It is a low frub, which feldom rifes two feet high, fending out many lignewus branches covered with a lightbrown bark, garnifhed clofely with oval fpear-haped leaves, fitting pretty clofe to the branches. They are entire, havirg a great number of fine iron-coloured hairs on their c diges and underfide. The fiowers are produced in bunches at the end of the branches in May, having one funncl-flaped petal cut into five obtufe fegments, and of a pale-red colour. They make a good flow, and are fucceeded by oval captules, containing ripe feeds in Auguf. 2. The ferrugineum, with fmontly leaves, hairy on their underfije, is a native of the Alps and Apemnines. It rifes with a thrubby falk near three feet high, fending out many irregular branches covered with at purplith bark, and colely garnifhed with fmooth fear-fliped entire leaves, whofe borders are reflexed backward; the upper fide is if a light lucid green, their under fide of an iron colnur. The flowers. are produced at the ends of the branches, are funnelfhaped, cut into tive fegments, and of a pale ofe olour. Thefe plants are propagated by feeds; but, being natives of barren rocky foils and cold fituations, they do not thrive in gadens, and for want of therr ufaral covering of fnow in the wiuter are often killed by frof in warmer climates. 3. The chamxciltus, or ciliated leaved dwarf rofthay, is a low deciduous thrub, ratise of Mount Baldus, and natr Saltzburg in Cermany. Is

ta, from their drinking, in common, a weak infuffen of it, as we do the Chinete plan of that name. This pratice fluws that the phont. ufes in fmall quan iries,
purplith bark. The leaves are oval, fpear-inaped, imat, and in the under furface of the colour of iton. The flowers are produced at the end of the branches ia bunches, are of a wheel-flaped figure, pretty large, of a fine crimfon colour, and handiome appearance. They appear in June, and are fucceeded by oval capiules containing ripe feeds in September. 4. The Durricum, or 1)autian dwarf role-bat, is a low deciduous thru', and native of Dauia. Its branches are numerous, and covered with a browith batk. The flowers are wheelflaped, large, and of a beautiful rofe culour : they appear in May, and are fucceeded by oval capfules full of feeds, which in England do not always ripen. 5. The maximum, or A merican mountain laurel, is an evergreen fhrub, and native of Virginia, where it grows na. turally on the higheft mountains, and on the edges of clifis, precipices, sic where it reaches the fize of a modederate tree, though in England it feldom rifes higher than fix feet. The flowers continue by fucceffion fometimes more than two months, and are fucceeded by oval capfules full of feeds. 6. The Ponticum, or Pontic dwarf rofe-bay, is an evergreen fhrub, native of the ealt, and of moit thady places near Gibraltar. It grows to the height of four or tive feet. The leaves are fpear-fhaped, glolly on both fides, acute, and placed on fhort foorftalks on the brancles: the flowers, which are produced in ciutters, are bell-fhaped, and of a fine purple colour. They appear in July, and are fucceeded by oval capfules containing feeds, which in England feldom attain to maturity.

In Siberia, a fpecies of this plant is ufed with great fuccefs in gouty and rheumatic affections; of which the following account is given in the 5 th volume of the Me dical commentaries, P 434. in a letter from Dr Guthrie of Peterßurgh to Dr Duncan of Edinburgh. "It is the rhododendrum chryfanthemum, nova fecies, belonging to the clats of decandria, difcovered by Profeffor Pallas in his tour through Siberia. This Alpine fhrub grows near the tops of the high mountains named Sajanes, in the neighbnurhond of the river Jenife in Siberia; and delights in the fkirts of the fnow-covered fummits, above the region that produces trees. When the inhabitants of that country mean to exhibit it in arthritic or rheumatic diforders, they take about two drams of the dried fhrub, ftalk and leaves, with nine or ten ounces of boiling water, and putting them into an earthen pot, they lute on the head, and place them in an oven during the night. This infufion (for it is not allowed to boil) the fick man drinks next norning for a dofe. It occafiuns heat, together with a degree of intoxication, refembling the effects of firituous liquors, and a fingular kind of uneafy fenfation in the parts affected, accompanied with a fort of vermiculatio, which is likewite confined to the difeafed parts. The patient is not permitted to quench the thirft which this medicine occafions; as fluids, particularly cold water, produce vomiting, which leffens the power of the fpe. cific. In a few hours, however, all the difagreeable effects of the dofe difappear, commonly with two or three forls. The patient then finds himfelf greatly relieved of his diforder; and has feldom occafion to repeat the medicine above two or three times to complete a cure. The inhabitants of Siberia call this Thrub chei or nutt be innocert. Profeli r Pallas informs me, that he lent i me time ago fome of this thrub driad t" Prafeffor Koelpin at Stetin; and he fhowed me a jetter from that gentiem:n, where he fiys, that he has given it wit: fucets in feveral cafes, particularly in what he calls the artliritica venerea, with a tophus arthriticus on the carpus, and it produced a complete cure. It muft be remarked, that the dofe which thefe hardy Siberians take, who are alfo in the habit of drinking it as tea, would, in all probability, be too ftrong for our countrymen; however, it is a medicine which we may certainly give with fafery, beginning with fmall dofes."
RHEEA. Sce Rhea.
RHGEADEA (rbxas, Linnæus's name, after Diofcorides, for the red poppy), the name, of the 27 th order in Linnæus's fragments of a natural method, confifting of poppy and a few genera which refomble it in habit and fructure. See Botany, p. 462.

RHOMBOIDES, in geometry, a quadrilateral figure whofe oppofite fides and angles are equal, but is neither equilateral nor equiangular.

Rhomboides, in anatomy, a thin, broad, and obliquely fquare flefhy mufcle, fituated between the bafis of the fcapula and the fpina dorfi; fo called from its figure. Its general ufe is to draw backward and upward the fubfpinal portion of the balis fcapulx.
RHOMBUS, in geometry, an oblique-angled pqrallelogram, or quadrilateral figure whofe fides are equal and parallel, but the angles unequal, two of the oppofite ones being obtufe and two acute.
RHONE, one of the larget rivers in France, which, rifing among the Alps of Switzerland, paffes through the lake of Geneva, vilits that city, and then runs fouthweft to Lyons; where, joining the river Soane, it cortinues its courfe due fouth, paling by Orange, Avig. non, and Arles, and falls into the Mediterranean a little above Marfeilles.
RHOPIUM, in botany: A genus of the triandria order, belonging to the gynandria clafs of plants; and in the natural method ranking with thofe that are doubrful. The calyx is monophyllous and fexpartite; there is no corolla nor any ftamina; the three antherz are each attached to one of the Ityli; the capfule is tricoccous and fexlocular, each containing two feedsr There is only one fpecies, viz. the meborea, a native of Guiana. This is a fhrub rifing about three or four feet in height. The flowers grow in the form of a corymbus; they are of a yellowifh green colour; the cap. fules are black.
RHOPOLA, in botany: A genus of the monogynia crder, belonging to the tetrandria clafs of plants ; and in the natural method ranking with thofe that are doubtful. There is no calys; the petals are four, oblong, obtufe, and narrowing at the bafe; the famina are four, inferted in the corolls, and have large anthera; the feed-veffel unilocular, and contains one feed. There is only one fpecies, viz. the montana. This is a flrubby plant growing in Guiana, and remarkable for the great number of branches fent off from its trunk in every direction, and for the fetid fmell of the wood and bark of this plant.

RHLTB , in navigution, a vertical ciale of any given place, or intertestion of luch a ciac'e with the horizon; in which laft fense thamb is the fame with a point of the conipals.

R:: ? In-Lan: is ation ufed for the line which a haip deferibes when filing in the fame collateral ofint of the compat or oblique to the meridzans.

RHUS, suabcil, in botany: A genus of the eriginiacrder, belonging to the pentandia clafo of plants; and in the natural meihoal ramking under the 4 od order, Duroofs. The calyx is gutinquepartite; the petals five; the lerry monotpermots. "Wiere a:e $2+$ dipecies, of 1. hich the moft iemarkable are,

1. The ceriaria, or elm-leavel fumach, grows naturally in 1taly, Spain, Turney, Syria, and Padeliwe. The branches of this tree are ufed intead of cak-batk for tanning of leather; ard it is fail that the 'Turkey leather is all tanned with this llorub. It has a ligneons salk, which divijes at bottom into many irregular branches, rifing to the lieight of eight or ten feet; the bark is hairy, of an hernaccous brown colour ; the lenves are winged, compoted of teven or eight pair of lobes, terminated by an odd one, bluntly fawed on their edges, hairy on their under fide, of a yellowifh.green colour, and placed alternately on the branches; the flowers gron in loofe panicles on the ead of the branches, which are of a whitifh herbaceous colour, each panicle being compofed of feveral fpikes of flowers fitting clofe to the footlalks. The leaves and feeds of this fort are ufed in medicine, and are efteemed very reffringent and Biptic.

2 .The typhinum, Tirginian fumach, or vinegar plant, grows naturalls in almoll every part of North America. This hath a woody Item, with many irregular branches, Which are generally crooked and deformed. The young branches are covered with a f.ft velvet-like down, refembling greatly that of a young llag's horn, both in colour and texture, fiom whence the common penple have given it the appellation of fag's loorn; the leaves are winged, compoted of fix or feven pair of oblong beart fhaped lobes, terminated by an ned ane, ending in acute points, hairy on their underfide, as is alfo the midri'). The Alusers are produced in clofe tufts at the end of the branches, and wrefucceeded by freds, inclofed in purple woolly ficculent covers; fo that the bunches are of a beatiful purple c. lour in autumn; and the leaves, before they fill in antumn, change to a purplith colour at firll, and b-fore they fall to a feuillemort. This plant, originally a mative of North America, has been long cultivated in the north of Germany, and is latelj introduced into Ruliat. It has gor the n.tre of the cinazar flant fiom the double realon of the soing germen of its iruit, when fermented, prolucing cither new: or alding to the ltrengh of old weak vinegar, whith its ripe berries afford an agrectule acid, which a:ight fupply the place when nocelliry of the cithic acid. The powertal altringency of this plant in all its parts recommends it as neeful in feveral of the arts. As for example, the ripe berries Loiled with alum make a good dye for lats. The phent in all its parts may be ufed as a fucredancum for wak-bark in tinning, effecially the white glove leather. It will likewile anfiver to prepare a dye for black, yreen, and yellow colours; and with martial vitriul it makes a good ink. The milky juice

220 K K U
that fluws from imeilions made in the trunk or branclaes, makes whea alried the bifis of a vamith litele inferior to the Chincfe. Lices anc remarkably fond of it, Anwers ; and it affords more boney than any of the huwering thrubs, fo that it may prove a uictul branch of ecnnomy, where rearing thefe infeds is an obj ©t. The nidtive, of Americat ife the dried laves as inbacen.
3. The glabrum, with winged leaves, grows naturaliy in many parts of North Anserisat this is commonly titles by the gardeners New England fimath. The flem of this is thonger and rifes higher than that of the former ; the branches fprend more lorizentally ; they are not quite fo downy as thofe of the laft, and the down is of a brownifl colour; the leaves are compoled of many more pair of lobes, which are fmooth on both lides; the 日iwers are difpoled in loofe panicles, which are of an herbacenies colnur.
4.'The Carelinianum, with fawed winged leaves, grows naturally in Carclina; the feeds of this werc taken from thence by the late Mr Catelby, who has given a igure of the plant in his Natural Hift ry of Catolina. Thi is by the gardeners called the fcarlet Carolina fioma $h$; it rifes commonly to the height of feven ir eight feet, dividing into many irregular branches, which are fmonth, of a purple colour, and pounced over with a grevih powder, as are allo the footldalks of the leaves. The leaves are compufed o' feven or cight pait of lobes, terminated by an odd one; thefe are not dways placed exaaly oppoli'e on the midrib, but are fumctimes alternate. The upper fide of the li bes are of a dark green, and thei: under hoary, but fmoth. The Howcrs are produced at the end of the branches in very clofe panicles, which are large, and of a bright red colour.
5. The Canadenfe, with winged fpear-fhaped leaves, grows naturally in Canada, Musland, and feveral other parts of North America. This hath fmooth branches of a purple colour, coveied with a grey pounce. The leaves are compofed of feven or cight pair of lobes, terminated by an odd one; the lohes are fpear-fhaped, fawed on their edges, of a lucid green on their upper furface, but hoary on their under, and are imooth. The howers are priduced at the end if the branches in large panicles, which are compoied of feveral fmaller, each ftading upon feparate foottalks; they are of a deep red cullur, and the whole panicle is covered with a grey pounce, as if it had bien fcattered over them.
6. The copallinum, or narrow-leaved fumach, grows naturally in mon parts of North America, where it is known by the title of bach fumath, probably from the place where it grows. This is of humbler growth than either of the former, feltom rifing more than four or five lect high in Britain, diviling into many fpreading branches, which are imonth, of a light brown colours, clofely garnithed with winged leaves, compofed of four or five pair of navenw lobes, terminated by an odd one; they are of a light green on both fides, and in autumn change purplifh. The midrib, which foftains the lobes, has on each fide a winged or leafy border, which runs from one pair of lohes to another, ending in joints at cach pair, by which it is eafilly dillinguilhed from the otherforts. The flowers are proluced in loofe panicles at the end of the branclies, of a yellowifh herbacsous colour.

Thele

Whus.
Thefe fix forts are hardy plants, and will thrive in the open air The firft and fourth forts ate not quite fo lhardy as the others, fo muthave a better fituation, otherwife their branches will be injured by fevere frof in the winter. They are eafily propaga ed by feeds, which if town in autumn the plants will come up the follow:ng fpring; but if they are fown in fping, they will not come up till the next fpring; they may be either fown in pots, or the full ground. If they are fown in pots in autumn, the pois thru'd be piaced under a common frame in winter, where the feeds may be protected from laird froot; and in the foring, if the pots are plunged into a very moderate hot-bed, the plants will foon rife, and have thereby more time to get Itrength before winter. When the plants come up, they mutt be gradually loardened to bear the open air, into which they fhould be removed as foon as the weather is favourable, placing them where they may have the morning fun ; in the fummor, they muft be kept clean from weeds, and in dry weather watered. Toward autumn it will be proper to ft.nt their growth by keeping them dry, that the extremity of their thoots muy harden; for if they are replete with moiltue, the early frofts in autuma will pinch them, which will caufe their fhoots to decay almolt to the butt $m$, if the plants are not fcreened from them. If the pots are put under a common frame in antum, it will fecure the plants from injury: for while they are young and the thouts foft, they will be in danger of fuffering, if the winter proves very fevere; but in mild weather they mult alwars enjoy the open air, therefore fhould never be covered but in frolt. The fpring followi:g, juft beliue the plarts begun to fhont, they fhould be Mlaten out of the po:s, and catefully feparated, fo as not to tear the roots; and tranflanted intu a nuriery, in rows three feet afunder, and one fort dittance in the rows. In this nurfery they may ftand wo years to get frength, and then may be traniplanted where they are to remain.
7. Befides thefe, Linnæus has included in this genus the toxiendendron or poifon-trce, under the name of rhus vernix or poifon-a/b. This grows naturally in Virginia, Pennfylvania, New England, Carolind, and Japan, rifing with a ftrong woody falk to the height of 20 feet and upwards; though in Britain it is feidom feen above 12, by reafon of the plants being extremely tender. The bark is brown, inclining to grey; the hranches are garnifhed with winged leaves conupuled of three or four pair of lobes terminated by an odd one. The lobes vary greatly in their thape, but for the molt part they arc oval and fpear-ilhaped. The footitalks become of a bright purple towards the latter part of fummer, and in antumn all the leaves are of a beantiful purple before they fall off.

All the fpecies of lumach abound with an acrid milky juice, which is reckoned poifonous; but this property is moft remarkable in the vernis. The molt diftinct account of it is to be found in Profeffor Kalm's 'Travels in Norih America. "An incifion (fays he) being made into the tree, a whitifh yellow juice, which has a nauicous timel, comes out between the bark and the wood. This tree is not knewn for its good qualities, but greatly fo for the effect of its poilon; whith, tho' it is noxinus to fome people, yet dues not in the leant affect others. And therefore one perfon can handle the tree as he pleafes, cut it, peel off its bark, rub it or
the wood upon lis hands, fmell at ir, fyread the juice Rhis. upon his fkin , and make more experiments, with no in. $\underbrace{\text { rer }}$ convenience to himfelf: another perfon, on the contrdry, dares not meddle with the tree while its wood is frefl.; nor can he venture to touch a hand which has handled it, nor even to expofe hmiclf to the fmoke of a fire which is made with this wood, without foon feel. ing its bad effects; for the face, the hands, and frequently the whole body, fwell exceffively, and is affected with a very acute pain. Sometimes bladders or billers arite in great plenty, and make the fick perfon look as it he was infected by a leprofy. In fome people the external thin okin, or cuticle, peels off in a few days, as is the cafe when a perfin has fealded or burnt any part of his body. Nay, the nature of fome perfons will not cven allow them to approuch the place where the tree gruws, or to expofe themfelves to the wind when it carries the eflluvia or exhalations of this tree with it, without letting them feel the inconvenience of the firelling which I have jult now defictibed. Their eyes are fometimes thut up for one, or two, or more days together, by the 1 welling. I know two brothers, one of whom could without aanger handle this tree in what manuer he plealed, whereas the other could not come near it withnut iweling. A perton fometimes does not know that he has touched this poifonous plant, or that be bas been near it, bufore his face and hands fow it by their (welling. I hale known old people who were more afraid of this tree than of a viper; and I was acquainted with a perion who, merely by the noxious exhalations of it, was fwelled to fuch a decree, that he was as ltiff as a log of wood, and could only be turned about in theets.
si I bave tried experiments of every kind with the poifon-tree on myfelt. I have fpread tis juice upon my hands, cut and broke its branches, peeled off its bark, and rubbed my hands with it, imeit at it, carried pieces of it in my bare hands, and repeated all this frequently, without feeling the banetul effects io commonly annexed to it ; but I, however, once experienced, that the poifon of the fumach wass not entirely without effed upon mee. On a h.rt day in fummer, as I was in fome degree of perfiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and fmelt at it now and then. I felt no effects from it in the evening. But next morning I awoke with a violent itching of my eye-lids and the parts thereabouts; and this was fo painful, that I could hardly keep my hands from it. It ceafed after I had wailhed my ejes for a while with very cold water. But my eye-ldds wore sery Itiff all that day. At night the itching returned; and in the moming when I awoke, I felt it as ill as the morning befure, and I uled the firme remedy againit it. Howevcr, it contunued almont for a whole week together ; and my eyes were very red, and iny eye-lios were with difficulty moved during all that time. My pain ceafed entirely atterwards. About the fame time I had fpread the juice of the tree very thick upen my hand. Three days after, they occafioned blifters, which foon went off without affesing me much. I have not experienced any thing mure of the effects of this plant, nor had $I$ any delire fo to do. However, I found that it could not exert its power upon me when I was not perfiring.
"I have never heard that the poifon of this fumach

## Kis

Shyme R Mind. $\underbrace{R-1}$ duration. " The natiocs formerly made their flutes of this tree, becoule it has a great deal of pith. Some people allured tre, that a petom durfering from its motome exhalations, would eatioy recover bey fpeading a mixture of the wood burnt to chascoal, and hog's lird, unon the fuelled parts. Some alferted, ifat they had veally tried this remedy. In fome places this tree is rooted out, (11 phrpole that its poi. inn maj not affet the workmen."

The natives are faid to dattinguith this tree in the dark by its extrome coldnefs to the touch. The juice of fome hinds of lumach, when cixpofed to the heat of the fun, becomes to thick and clammy, that it is uled for bird-lime, and the infpifated juice of the peion-alh is faid to be the fine varnifh of Japan. A cataplatim made with the treth juice of the poifn-afh, applied to the fect, is faid by Hughe, in his Natural Hitory of Barbadoes, to kill the vermin called by the Weft Indian. chigers. Very good vinegar is made trom an infulion of the Sruit of an American fumach, which for that reafun is called the vinegar-trec. The refin called gun: copsl is from the alus copallinum. See Cupal.

RIMYME, Rhime, Ryme, or Rime, in poetry, the fimilar found or cadence and termination of two words which end two verfes, \&c. Or rlyme is a timilitude of found between the lat fyllable or fyllables of a verie, fucceeding either immediately or at a diftance of two or three lines. Sce POETRY, n ${ }^{\mathbf{U}} \mathbf{1 7 7}$, \&c.

RHYMER (Thomas the), was a native of the parifh of Earltown, in the county of Derwick. His real name and title was Sir Thomas Lermont. He lived at the weft cnd of Earllown, where part of his houfe is now Atanding, called Rhymer's Tosuer; and there is a fione built in the fore wall of the church with this inlicription on it,

## Auld Rhymer's race lies in this place.

He lived in the $13^{\text {th }}$ century, and was contemporary with one of the earls of March, who lived in the fame place.

RHYTHM, in mulic, the variety in the movement, as to the quicknels or flownefs, length or thortnefs, of the notes. Or it may be defined more generally, the proportion which the parts of the motion have to each other.

RIAL, or Ryal, a Spanifh coin. See Money Ta'le.

Rial, or Royal, is allo the name of a picce of gold anciently current in Britain for 10 s .

RIBAN, or Ribban, in heraldry, the cighth part of a bend. See Heraldry, p. 447.

RIBAND, or Rabbon, a narrow fort of filk, chiefly ufed for head-ornaments, badges of chivalry, \&c.

In order to give our readers an idea of the manner in which this curious and valuable branch of manu. factures is managed, a view of the ribbon we.ner at his loom is reprefented in Plate CCCCXXXV. where 1. Is the frame of the leom. 2. The ceitle, containing 48 pulleys. 3. The branches, on which the pul. leys iurn. 4. 'the tires, or the riding cords, which run on the pullcys, and pull up the high-liftes. 5. The lift-fticks, to which the high-lifes are tied. 6. The liigh-liffes, or lifts, are a number of long threads, with platines, or plateleads, at th.e bottom ; and ringlets, or
loops, about their midale, through which the cords or crofs-threads of the ground-harnefs ide. 7. The plateleads, or platines, are fiat picces of lead, of about fix incles long, and three or fuur inches broad at the tep, but round at the bottom; fome ufe black hlues inltead of them: their tife is to pull down thote lifies which the workman had raifed by the treddle, after his foot is taken off. S. 'The branches or cords ot the ground-harnefs, which go thro' the lo ps in the middle of the himhlines: on the reil-ordering of thefe cords chicfly depends the art of ribbon-weaving, becaufe it is by means of this contrivance that the weaver draws in the thread or lilk that makes the flower, and rejects or excludes the rett. 9. The batton: this is the wooden trame that loolds the reed or thuttle, and beats or clofes the work: where, obferve, that the ribbon-weaver does not beat his work; but as foon as the foutle is paffed, and his han 1 is taken away, the batton is loreed, by a fpring from the top, to beat the work clofe. 10. The fluttle, or reed. 11. The fpring of the betton, by which it is made to clofe the work. 12. The long-harnets are the front-reed, by which the figure is raifed. 13. The linguas are the long pieces of round or fquare lead, tied to the end of each thread of the long-harnefs to keep them tight. I4. The broad piece of wood, about a foot fyuare, leaning fomewhat forward, intended to eafe the weaver as he ftoops to his thutle; it is fixed in the middle of the breall-beam. Some weavers, infead of this, have a contrivance of a cord or rope that is faltened to the front-frame, and comes acrofs his breaft ; this is called a fopfull. 15. The reat-bench; this leans forward very much. 16. The foot itep to the treddles. 17. The breatt-beam, being a crofs-bar that paffes from one of the flandards to the other, fo as to front the workman's brealt: to this brealt-bar is fixed a roll, upon which the ribbon paffes in its way to be rolled tipon the rollet, that turns a little below. 18. The clamps, or pieces of wood, in which the broaches that confine the tredjles reft. 19. The treddles are long narrow pieces of wond, to the ends of which the cords that move the liffes are faltened, 20 . The treddle-cords are only diftinguithed from the riding-cords by a board full of holes, which divide them, in order to prevert the plate-leads, which are tied to the high-lilfes, from pulling them too high when the workman's foot is off the treddle: which ilop is made by a knot in the treddlecord, ton big to be forced through that hole in the buard. 21. The lames are two pieces of thin narow boards, only ufed in plain works, and then to fupply the place of the long harnefs. 22. The knee-roll, by which the weaver rolls up his ribbon as he fees proper, or by bit and bit as it is finilhed. 23. The backiolls, on which the warp is rolled. It is to be obferved, that there are always as many rolls as colours in the work to be wove. 24. The clamps, which fupport the sollers. 25. 'Ihe returning. Aicks, or, as others call them, the returns, or the tumblerr, or pulleys, to which the tiers are lied, 10 clear the courfe of cords through the high-liffes. 26. The catch-board for the tumblers. 27. The tire-board. 28. The buttons for the knee-rolls and treddle-board, defcribed in number 20.

Ribhons of all forts are prohibited from being ims ported into Britain.

RIBANDS (from rid and bcnd), in naval architec-

## Ribands, Ribes. Ribes.

ture, long narrow flexible pieces of timber, nailed upon the outfide of the ribs, from the ftem to the fternpoft, fo as to envelope the fhip lengthwife, and appear on her fide and bottom like the meridians on the furface of the globe. The ribands being judicioully arranged with regard to their height and diftance from each other, and forming regular fweeps about the flhip's body, will compofe a kind of frame, whole interiur fur. face will determine the curve of all the intermediate or filling-timbers which are fationed between the principal ones. As the figure of the thip's bottom approaches to that of a conoid, and the ribands have a limited breadeh, it is apparent that they cannot be applied to this convex furface without forming a double curve, which will be partly vertical and partly horizontal; fo that the vertical curve will increafe by approaching the ftem, and fill more by drawing near the ftern-pof. It is alfo evident, that by deviating from the middle line of the fhip's length, as they approach the extreme breadth at the midfhip-frame, the ribands will alfo form an horizontal curve. The loweft of thefe, which is terminated upon the Rem and ftern-puft, at the height of the rifing.line of the floor, and anfwers to the upper part of the floor-timber upon the midfinipframe, is called the floor-ribamb. That which coincides with the wing-tranfom, at the height of the lower-deck upon the midhip-frame, is termed the bresdth-riband; all the rcit, which are placed between thefe two, are called intermediate rilands. See Ship-building.
ribes, the Currant and Gooseberry-bush: A genus of the roonogynia order, belonging to the pentandri. clafs of plants ; and in the natural method ranking under the $3^{6 \text { th }}$ order, Pomacea. There are five petals, and ftamena inferted into the calyx ; the ftyle is bifid; the barry polyfpermous, inferior.

The currant and the goofeberry were long confidered each as a feparate genus; riber the currant, and groffularia the goofeberry; but they are now joined together, the groflularia being made a fpecies of ribes; all the currant kinds having inermous or thornlefs branches, and racemous clufters of flowers and fruit, and the goofeberry, have fpinous branches, and flowers and fruit for the moft part fingly.

There are three fpecies of the currant-tree, two of which, and their varieties, merit culture for their fruit; the other as a plant of variety for obfervation: all of which are inermous or unarmed, having no thorns on the branches.

1. Rubrum, common red-currant tree, \&cc. hath a flurubby fem, dividing low into many branches, forming a bufhy head, five or fix feet high or more, without thorns; broad trilobate leaves, and imooth pendulous clufters of plane greenilh flowers, fucceeded by imall clufters of berries. It grows naturally in woods and the hedges in molt parts of Europe, and comprifes all forts of red and white currants; as, common fmall red cur-rant-large bunched red currant-Champaigne palered currant-common fmal! white currant-large white Dutch currant-yellow blotched-leaved currant-filver Atriped leave!-g Id Ariped leaved-goofeberryleaved. All theje frorts are varieties of one fpecies, ribes rubrum, or common red currant; it being the parent from which all the others were firt oltained from the feed, and improved by culture. They all fower in the fritig, and the fruit ripens in June and

July; and by having the trees in different fituations and modes of training, fuch as plantations of ftandards in the open quarters for the general fupply, others trained againtt walls or pales of different afpect, the fruit may be continued ripe in gond perfection from abuut the middle of June until November, provided the later crops are defended with mats or nets from the birds.
2. The nigrum, or black currant tree, hath a fhrubby fem, dividing low into many branches, forming a bufty liead five or fix feet high; broad trilobate leaves of a rank odour, and having racemous clufters of oblong greenifh flowers, fucceeded by thin clufters of black berries. The fruit of this fpecies being of a ftrong flavour, and fomewhat phyfical relifh, is not generally liked; it, however, is accounted very wholefome: there is alfo made of it a fyrup of high eftimation for fore throats and quinfies; hence the fruit is often called fquinancy berries. There is a variety called the Pennfylvanian llack currant, having fmaller thoots and leaves, not frong fcented, and finall fruit but of little value; fo the fhrub is efteemed only for variety and fhrubberies. The mode of bearing of all the varieties of currants is both in the old and young wood all along the fides of the branches and thoots, often upon a fort of fmall fprigs and fnags, producing the fruit in numerons long pendulous clutters.
3. The grollularia, or common goofeberry bufh, rifes with a low fhrubby fem, dividing low into a very branchy bufhy head, armed with fpines; trilobate fmallifh leaves, having hairy ciliated fonttalks; and fmall greenifh flowers, fucceeded by hairy berries. It confifts of many varieties, if different fizes and colours.
4. The reclimatum, or reclinated broad-leaved goofe-berry-buif, rifes with a low fhrubby ftem, and reclinated fomewhat prickly branches, trilobate broadifh leaves, and fmall greenith flowers, having the pedunculi furnifhed with trsphyllous bractea.
5. The oxyacanthoides, or oxyacantha-leaved goofeberry, hath a fhubby ftem, and branches armed on all fides with fpines, and largilh trilobate hawthorn leaves.
6. The uva crippa, or fmooth goofeberry, hath a fhrubby fem, and branches armed with fpines; trilobate leaves; pedicles having monophyllous bractea; and fmooth fruit.
7. The cynofbati, or prickly-fruited goofeberry bufh, hath a thrubby ftem and branches, armed with fpines, mofly at the axillas, and prickly fruit in clufters.

All the above feven fpecies of ribes, both currants and goofeberry linds, and their refpective varieties, are very hardy fhrubs, that profper almoft anywhere, both in upen and fhady fituations, and in any common foil ; bearing plentifully in any expofure, though in open funny fituations they produce the largeft and fairelt fruit, ripening to a richer vinous flavour ; but it is eligible to plant them in different fituations and afpects, in order to have the fruit as early and late as pofible.

They are commonly planted in the kitchen-gardea, mofly as dwarf ftandards, in the open quarters, for the general fupply; being difpofed fometimes in continued plantations in row's, eight or ten feet by fix afunder, where great quantities of the fruit are required for market or other large fupplies; and are fometimes difpofid in fingle ranges round the outward

Nibes cage of the quartars, cight feet afunder; frequently in fing le crins rows, in oriter to divide the ground into fe, arae wide flats or break, of from 23 tw 30 or 90 f.er wise, wheh also lerves to thelter the ground a latis in winter; in all of whels mehods of planting liem as Itandards, they thowld be genemally traned up tu a angle dems about a loot ligh, then futfered to betach out erery way all around into buthy heads, heceping the middie, lewever, upen, ath the branche, moderntely thon, to admit the fundendte.e intr though it lome are farned, that is, trimmed an two hdes oppriacly, 10 as to make the other branches range in a lame like an ebsaik, they will take up much lefs of t!e ground, and, by asmitting the fun and air more irecly, they will produce large tair jruit. 'They are likumise tadines agaiut wallstr palags, like other wa!ltrec, but proncupally fome of the large red and white Liat. is currauts, in which they will produce fine large arut, and thofe deantat any filuth fence will ripen e:ar1), atad be high flisoured; but it is proper to plant a tew both aganit fouth, north, ealt, and weft walls, in order to cbtain the fruit ripe both early and late, in a long fiacculion. It is alfo proper to plant a few of the hacit forts of goofeberries againft a warm fence, both to lave early green goofeberies for tarts, \&c. as well as to ripen early; and they will grow very large and fine. Sometimes boch currants and goofoberries are allo trained in low ejpaliers for variety, and they produce vary fine fruit.

The fruits both of the currant and goofeberry are of an asid and cooling mature, and as fuch are fome. times ufed in m-dicine, efpec ally the juice reduced to a jelly by boiling with fugar. From the juice of currants alin a very agreeable wine is made.

Ricaut', or Recsut (Sir Paul), an eminent Engllh traveller, of the time of whofe birch we find no account ; but in 165 r , he was appointed fecretary to the earl of Winchelfea, who was fent ambaredor extraordinary to the Ottoman Porte. During his continuance in that Atation, he wrote, "The prefent Stute of the Ottoman Empure, in three books, couraining the maxims of the Turkith policy, their religion, and military difcipline," London, iolio, 1670 . He afterw:ird; relided 11 years as conful at Smy:na, where, at the command of Charles II. he compored "The prejent \{tate of the Greek and Armenian Churches, anno Cbriji 16-8." On his return, Lond Clarendon b.ing :ppuinted lord lieutenant of Ireland, made him his principal lecretary for Leinfter and Connaught: king james 11 . knirhted him; and made him one of the privi. courcil in Treland, and judge of the court of admiraly; a.l which he held till the Revolution. He was employed by King William as refident at the Hanfetowns in Lower Saxony, where he continued for ten years; but being worn out witl age and isfirmities, he obtained leave toreturn in 1700 , and died the fame year. Ricaut continued "Knolles's Hittory of the T'uke, and l'latima's Lives of the Popes;" belides whicib, there are fome orber productions under his name.

RICCIA, in botany : A genus of the natural order of algx, belonging to the cry ptogami. clats of plants. These is nocaljx, but a veficular cavity withis the fubtarece of the leaf. The e is no corollia; the anthere ate cylindrical, and fellile, place 10 oo the germen, which is turbinated; the ayle is liliform, perforating the an-
thera; and the fecd cafe is fpherical, crowned with the whinered anthera; the feeds are hensifpherical and pedicellated.

RICE. Sce Oryza. "Rice bras, (fays Mr Marfden) whilf in the hatk, is in India called fadier, and alfumes a dificrent name in each of its other various Atites. We obterve no ditlintion of this kind in Eu. rope, where our grain retains though all its flages, till it becames flour, its uriginal name of barley, wheat, or Oat. The fo'lowing, b tide many other", are anmes applied to rice, in its diffesent llages of grow:h and preparation : faddec, origimal name of the lecd: ooficy, grain of la? featon: bunnee, the plants befire ramoved to the fawours: bras or bray, rice, the huok of the padjee being taken off: charroop, rice cleaned lor builng: naffer, buied rice : pecrang, yellow rice : jambur, a fervice of ice, \&c.

Among people whofe general objects of contemplation are few, thofe which do of necellity engage their attention, are clien more nicely diferiminated than the fance ofjects among more enlightened people, whofe ideas ranging over the extenfive fild of art and feience, difdain to fix long on obvicus and ermmon matters. Padhe, on Sumatra and the Malay iflands, is dittingruhed into two forts; Laddusg or up-land paddee, and Sawost or low.land, which are always kept repa. rate, and will not grow reciprocally. Of thefe the former beats the hirher price, being a whiter, heartier, and better flavoured grain, and hawing the advantage in point of keeping. The lutter is much more prolific from the feed, and liable to let's rink it the culture, but is of a watery fubltance, produces lefs increafe in boiling, and is fubject to a fwifter decas. It is, however, in more common ufe than the former. Bctide this general difination, the paddee of each fort, particularly the Laddang, prefents a variery of fpecics, whi.h, as far as my information extends, I Thall enumerate, and endeavour to deferibe. The commen kind of dry ground paddee: culour, light br wn : the fize rather large, and very little crooked at the extremity. Paddee undallongs dry ground: thort round grain: grows in whorles or bunches round the fock. Paddee ebbafs: dry ground: large grain: common. Paddee galoo: dry ground: light coloured: foarce. Paddez fenne: dry ground deep coloured; fmall grain : fiarce. Piddee ejoo: dry ground: light coloured. Paddee kooning : ary grounds dcep yellow: fine rice: cruciked, and pointed. Poddee coocoor ballum: dry round: much efteemed: light coloured; fmall, and very much crooked, refembling a dove's nanl, from whence its name. Paddee pefing: dry ground: outer coat light brown; inner red: longer, Imaller, and lets crooked than the coocoar lallum. Paddee Santong: the finelt fort that is planted in wet ground : Imall, ftaight, and light eoloured. In general it may be obferved toat the larger grained rice is the leaft efteemed, and the fmaller and whiter the moft prizes. In the Lampoon country they make a diftinction of paddee crawang and paduee jerroo; the former uh which is a month earlier in growth than the latter."

liICHARDIA, in botany: A genus of the mono. gynia order, belonging to the hexandria clafs of plants:

## RIC [ 233 ] R I C

Richardfon and in the natural method ranking under the 47 th order, Stellate. The calyx is fexpartite; the corolla monopetalous, and fubcylindrical; and there are three feeds.

RICHARDSON (Samuel), a celebrated Englifh fentimental novel-writer, born in 1688, was lired to the bufinefs of a printer, which he exercifed all his lite with eminence. Though he is faid to have underfood no language but his own, yet he acquired great reputation by his three epiftolary novels, intitled Pame.a, Clariffa, and Sir Charles Grandifon; which thow an uncommon knowledge of human nature. His purpofe being to promote virtue, his pictures of moral excellence are by much too highly coloured; and he has dcfrribed his favourite characters fuch rather as we might wifh them to be, than as they are to be found in reality. It is alfo objected by fome, that his writings have not always the good effect intended: for that, inftead of improving natural characters, they have $f_{a}$ fhioned many artificial ones; and have taught delicate and refined ladies and gentlemen to defpile every one but their own felf-exalted perfons. But after all that can be urged of the ill effects of Mr Richardfon's novels on weak minds, eager to adopt characters they can only burlefque; a fenfible reader will improve more by Itudying fuch models of perfection, than of thofe nearer to the natural flandard of human frailty, and where :hofe frailties are attfully exaggerated fo as to fix and mifemploy the attention on them. A froke of the palfy carried off Mr Richardfon, after a few days illnefs, upon the $4^{\text {th }}$ of July 1761 . He was a man of fine parts, and a lover of virtue; which, for aught we have ever heard to the contrary, he fhowed in his life and converfation as well as in his writings. Befides the works abovementioned, he is the author of an $\mathbb{E}$ fop's Fables, a Tour through Britain, 4 vols. and a volume of Familiar Letters upon bufinefs and other fubjects. He is faid from his childhood to have delighted in letter-writing; and therefore was the more eatily led to throw his romances into that form ; which, if it enlivens the hiftory in fome refpects, yet lengthens it with uninterefting prate, and formalities that mean nothing, and on that account is fometimes found a little tedious and fatiguing.

The moft eminent writers of his own conntry, and even of foreign parts, have paid their tribute to the tranfcendant talents of Mr Richardfon, whofe wor's have been publifhed in almof every language and country of Europe. They have been greatly admired, notwithftanding every diflimilitude of manners, or every difadrantage of tranflation. M. Diderot, a late celebrated French author, fpeahing of the means employed to move the paffions, in his Elf.ly on Dramatic Poctry, mentions Richardfun as a perfeet malter of that art: "How friking (fays he), how patheric, are his defcriptions! His perfonages, though filenr, are alive before me ; and of thofe who fpeak, the actions are fill more affecting than the words." -The famous John James Rouffeau, fyeaking, in his letter to M. d'Alembert, of the novels of Richardfon, aflerts, "that nothing was cver written equal to, or even approaching them, in any language."-Mr Aaron Hill calls his Pamelit a "delightful uun fery of virtue."-Dr Warton fpeaks thus of Clementina: "Of all reprefentations of madnefs, that of Clementina, in the Hiftory of Sir Charles Grandion,

Vol. XVI.
is the moft deeply interefing. I know not whether Richerifo:r ben the madnefs of Lcar is wrought up, and expreifed, by fo many little flrokes of nature and paffion. It is abfolute pedantry to prefer and compare the madnefs of Oreftes in Euripides to tris of Clementina."-Dr Johnfon, in his Introduction to the $97^{\text {th }}$ number of the Rambler, which was written by Mr Richardfon, ob. ferves, that the reader was indehted for that day's entertainment to an author, "from whom the age has received greater favours, who has enlarged the knowledge of human nature, and taught the palfions to move at the command of virtue ;" and, in his Life of Rowe, he fays, "The character of Lothario feems to have been expanded by Richardfon into that of Lovelace ; but he has excelled his original in the moral effect of the fiction. Lotharic, with gaiety which cannot be hated, and bravery which cannot be defpifed, retains too much of the ipectator's kindnefs. It was in the power of Richardfon alone to teach us at once eiteems and deteftation ; to make virtuous refentment overpower all the benevolence which wit, and elegance, and courage, naturally excite; and to lofe at laft the hero in the villain."-Dr Young very pertinently obferved, that Mr Richardfon, with the mere advantages of nature, improved by a very moderate progrefs in education, fruck out at once, and of his own accord, into a new province of writing, in which he fucceeded to admiration. And what is more remarkable, that he nct only began, but finifhed, the plan on which he fet out, leaving no room for any one after him to render it more complete: and that not one of the various writers that have ever fince attempted to imitate him, have in any refpest equalled, or at all approached near him. This kind of romance is peculiarly his own; and "I confider him (continues the Doctur) as a truly great natural genius; as great and fupereminent in his way as Shakefpeare and Milton were in theirs."

Richardson (Jonathan), a celebrated painter of Walpoic's heads, was born about the year 1665, and againft his inclination was placed by his father-in-law apprentice to a fcrivener, with whom he lived fix years; when obtaining his freedom by the death of his matter, he followed the bent of his difpofition, and at 20 years old became the difciple of Riley; with whom he lived four years, whofe niece he married, and of whofe manner he acquired enough to maintain a folid and lafting reputation, even during the lives of Kneller and Dahl; and to remain at the head of the profeffion when they went off lie ftage.

There is Atrength, roundnefs, and boldnefs in his co. louring; but his men want dignity, and his women grace. The good fenfe of the nation is characterifed in his portraits. Yon fee he lived in an age when neither enthufiafm nor fervility were predominans. Yet with a pencil fo firm, poffefled of a numerous'and excellent collection of drawings, full of the theory, and profound in reflections on his art, he drew nothing well below the head, and was void of imagination. His attitudes, drapenies, and back-grourds, are totally infipicd and unmeaning ; fo ill did he apply to his own practice the fagacious rules and hints he befowed on others. Though be wrote with fire and judgment, his paintings owed little to either. No man dived deeper into the inexhauftible fores of Raphael, or was more fmiten with the native luftre of Vandyck. Yet though capaGg
bie
n+t ine

- Fice ontig ti:2 clewation of the one and the elegance U the cther, he cotald never contrive to fee wrh their eyes, wilen he was to copy nature himeref. One wondeas thas he combld comment theis worl. fo well, and initut: thern foltile.

He quitud butinefs hindeif fome ye.rs before his de.al? ; but his temperance and virtue conntibuted to proirat lis hife to a great lenglh in the full enjorment of his underfanding, and in thie felicity of domeftic fiendit.p. He had hat a paralytic Atroke that affectad his arm, yet never difabled him from his cutomary waiks and excrcife. He had been in St James's Park, and died fudden'y at his houfe in ()ueen's-fquare on his return home, May" $28.15+5$, when he had paffed the Soth jear of his age. He left a fon and four daughters, one of whom was married to his difciple Mr Hudfun, and another to Mr Grigion an attorney. The tafe and learning of the fon, and the harmony in which he lived with his father, are vifible in the juint works they compofed. The father in 1719 published two difcourfes: 1. An Eliay on the whole Ant of Criticiom as it relates to l'ainting ; 2. An Argument in behall of the Scierce of a Comoifleur ; bound in one volume octave. In 1722 came forth An Account of fome of the flathes, bas-reliefs, drawings, and piftures, in Italy, Sic. wi:h Remarks by Mr Richardfon, fenior and juniur. The fon made the journey; and from his notes, letters, and obfervations, they both at his return compilod this valuable work. As the father was a formal min, with a flow, but lund and fonorous woice, and, in truth, with fome affectation in his manner; and as there is much fingularity in his ityle and expreffion, thefe peculiarities, (for they were farcely foibles) fruck fuperfi. i.al readars, and between the langhers and the envious the book was much ridiculed. Yet both this and the tormer are full of natter, good fenfe, and infruction: and the very quaintnet's of fome expreffions, and their labcured novelty, fhow the difficulty the anthor had to convey mere vifible ideas through the medium of langruage. Thofe works remind one of Cibber's inimirable treatife on the fage: when an author writes on lis own profefion, feels it profoundly, and is fenfible 1 is readers do not, he is not only excufable, but meritorivus, for illuminating the fubjeet by new metaphors or bolder figures than ordinary. He is the coxcomb that fineers, not he that inftructs, in appropriated diction.

If thefe authors were cenfured when converfint within their own circle, it was not to be expected that tl.cy would be treated with milder indulgence when they rentured into af fifter segion. In 1734 they publithed a very thick oftavo, containing explanatory notes and remarks on Milton's Paradife Loft, with the life of the author, and a difcoufe on the poem. Again were the good fenfe, the judicious criticifms, and the fentiments that Lroke furth in this work, forgotten in the fingulaties that diftinguif it. The fither having frid in apolegy for being little convenfant in claffic literature, that he had looked into them through his fon, Hozarth, whom a quibble could furnin with vit, deew the lather peeping through the nether end of a telefonpe, with which his fo was perforated, at a Virgil alolt on a flelf. Yet liow forcibly Richardion entered into the fpirit of his author, appears from his compehenlive expreffirn, that Milton wass an ancien;, born
two thonitald yec:"s afier his t.mes. Richardfon, however, was as incapable of reaching the fullime or hamonious in poetry, as he was in painting, though io capable of illutrating both. Some ipecinens of verfe that he has given us here and there in his wosks, excite no curiofity for more, though he informs us in his Mton, that if painting was his wife, peetry had been his fecret concubine. It is remarkable, thit amother commontator of MIton has made the fame confellion,

$$
\overline{\text { Tatint ponfores }} \text { Suri carnina, me quoque dicunt }
$$

fays Dr Bendey; Neither the doaor nor the paineer add fodnon ego credulus illis, though all their readers are ready to fupply it for both. Defides his pietures and commentaries, we have a few etchings by his hand, particulatly two or three of Milton, and his own head. The fale of his collection of drawings, in February 1747 , lafled 18 days, and produced about 20601. his pitures about 7001 . Hudfon his fon-in-law bought many of the drawings.

RICHELE'l (Cxfar Peter), a French witer, born in 1631 at Chemin in Champagne. He was the friend of Patru and Ablancourt ; and like them applied himfelf to the fudy of the French language with fuccefs. He compiled a dictionary of that language, full of new and ufeful remarks ; but exceptionable, as containing many fatirical reftections and obfcenities. The beft edition is that of Lyons, 3 vols folio, 1728. He alfo collefted a fmall ditaionary of rhymes, and compofed fome other pieces in the granmatical and critical way. He died in 1698.

RICHES, a word ufed always in the plural number, means wealth, money, polfeffion, or a fplendid fump)tuous appearance. When ufed to exprefs the fortune of private perfons, whether patrimonial or acquired, it figniñes opulencea; terms which exprefs not the enjoyment, but the poffefion, of numerous fuperfluities.The riches of a fate or kingdom expreffes the priduce of indultry, of commerce, of different incorporated bodies, of the internal and external adminiftration of the principal members of which the fociety is compofed, sc.

Cur Saviour fays, that it is more eafy for a camel to go th:ough the eye of a needle, than for a rich man to enter the kinglum of heaven; and we find, in fact, that riches frequently bring along with them a degree of inattention, lukewarmncfs, and irreligion, fuch as fufficiently confirms the divine affertion; which is merely is general truth, and which by no means afferts the abfolute impeflibility of being virtuous and rich at the fame time. For as the ancient philofophers wifely taught, riches, confidered in themfelves, and abfractedly from the bad purpofes to which they may be applied, are not neceffarily incompatible with virtue and wifdom. They are indeed abfolutely indifierent; in good hands they will be ufeful, and promote the caufe of truth, virtue, and humanity; and in bad hands they are the fource of much mifchief; on the one hand they confer the power of doing much good, and on the other they are equally powerful in doing ill.

To men, however, whofe principles of virtue are not fufficiently founded, tiches are unquenliomably a dangerous and feducing, bait ; and as the ancients rightly taught, they anc to the greatef number of men, in an
infinite

## R I C

infinite variety of circumftances, a powerful obftacle to the practice of moral virtues, to the progrefs of truth, and a weight which prevents them from rifing to that degree of knowledge and perfection of which human nature is capable. They multiply without ceafing the occafions of vice, by the facility which they give to fatisfy a multitude of irregular pafions, and to turn at length thofe who are attached to them from the road of virtue, and from the defire of enquiring after truth.

It is this which Seneca means to exprefs, when he fays," that riches in a vall number of cafes hare been a great oblarle to philofophy; and that, to enjoy freedom of mind neceffars for ftudy, a man mult live in poverty, or as if he were poor. Every man (adds he) who wilhes to lead a pleafant, tranquil, and fecure life, mult avoid, as much as poffible, the deceitfulnefs of riches, which are a bait with which we allow ourfelves to be taken as in a fuare, without afterwards having the power to extricate ourfelves, being fo much the more unlappy, that we believe we poffeis them, while, on the contrary, they tyrannize over us." Senec. Epijf. 17. and $E_{\text {fijl }}$ \% 3.
"The wife man (fays the fame author in another place) does not love riches to excefs, but he would not choore wholly to diveft himfelf of them; he does not receive them into his foul, but into his houre ; he is careful of them, and employs them for the purpofe of opening a wide field for virtue, and of naking it appear in all its fplendor. Who can doubt that a wife man has not more occafions of diflaying the elevaticn and greatnefs of his mind when he is poffiefled of riches than when he labours under indigence, fince, in the laft conditicn, he can exercife only one virtue, namely, refignation; whereas, riches give him an opportunity of diiplaying, in their greatefl luftre, the virtues of temperance, liberality, diligence, regularity, and magnificence. There is no occafion, then, to prohibit philofophers from the ure of wealth, or to condemn wifdom to poverty. The philofopher may poffers the greatelt iches, provided he has not employed force or thed blood in acquiring them ; provided he has not gained them by unjurt or illegal means; in a word, provided the ufe which he makes of them be as pure as the fource from which they were derived, and no perfinn (the envious excepted) recretting his pofieflicn; he will not refure the kindrefs of lcrtune, and will enjoy, without hame or pride, the wealth acquired by honeft means ; he will have more reafen to glory, if, afier expofing his riches to the view of the whole world, he can defire any perfon to carry away the reward of treachery or the fruits of oppreflion. If, after thefe words, bis riches continuc undiminified, this man is truly great, and worthy to be rich. If he has not allowed to enter into his poffeflion the frnallelt piece of money gained by unwarrantable mears, neither wi.l he refure the greateी riches, which are the bleffings of fortune, and the fruit of virtue: if he can be rich, he will choofe to be fo, an the flaill have riches; but he will regard them as blefings of uncertain poffeliicn, and of whiclt he may be evary moment deprived; he wiil not permit them to be a load to himfelf or to ochers; he will give then to the grod, of to thofe whom he wryld make good; but he will give then with the ricelt wif. don, taking care always to c:laribuse thcm to Lhe moit
worthy, and to thore who remember that they mut Riclilete. give an account, as well of the wealth which they receive from heaven, as of the pur- fes to which it is applied." Senec. de Vila Beata, cap. 21, 22, \& 23.

RICHLIEU (John Ammand du Pleffis de), cardinal of Richlieu and Fronfac, bihop of Lncon, \&ic. was born at Paris in 1585 . He was of excellent parts; and at the age of 22 had the addrefs to nbtain a difipe:ifation to enjoy the bifhopric of Lucon in 1 Co\%. Re. turning into France, he applied himfelf in a particul.s manner to the function of preaching; and his reputation this way procured him the office of almoner to th: queen Mary de Medicis. His abilities in the manage. ment of affairs advanced him to be fecretary of faie in 1616 ; and the king foon gave him the preference to all his other fecretarics. The diath of the marquis d'Ancre having produced a revolution in thate affairs, Richlieu retired to Avignon; where he employed himfelf in compoling books of controverfy and piety, The king having recalled him to court, lie was made a cardinal in 1622 ; and, two years after, firt minifter of ttate, and grand matter of the navigation. In 1626 , the ifle of Rhée was preferved by his care, and Rochelle taken. having fopped up the haven by that famous dyke which the ordered to be made there. He accompanied the king to the fiege of Cazal, and contributed not a little to the raing of it in 1629 . He alfo obliged the Hugrenots to the peace at Alets, which proved the ruin of that party; he trok Pamerol, and fuccoured Cazal befiezed by Spinola. In the mean time the nobles found fault with lis conduet, and perfuaded the king to difcard him. The cardinal, for his part, was unmoved with it; and by his reafonings overthrew $u$ hat was thought to be determined againlt him ; fo that, inltead of being difgraced, he from that moment became more powerful than ever. He punifhed all his enemies in the fame manner as they would have had him fuffer; and the day which produced this event, fo glorious to cardinal Richlieu, was called the day' of dupes. This able minifter had from thenceforwards an afcendancy orer the king's mind; and he now refolved to humble the exceffive pride of the houfe of Aultria. For that purpofe he concluded a treaty with Guftavus Adolphus king of Sweden, for carrying the war into the heart of Germany. He alfo entered into a league with the duke of Bararid ; fecured Lorrain; raifed a part of the princes of the empire againtt the emperor ; treated with the Dutch to continue the war againt Spain; favoured the Catalans and Portuguele till they fhook off the Spanifh yoke; and, in fhort, took fo many different meafures, that he accompl thed his defign; and after having carlicd on the war with fuceefs, was thinhing of concluding it by a peace, when he died at Paris on the 4 th of $D e$ cember $16_{42}$, aged 58 . He was interred in the Sorbome, where a mugnificent maufoleum is ere?ted to his memory. This great poitician made the arts and fiences flourifl; formed the boturical garden at Paris, called the king's garie, ; founded the Fie ch academy ; cheblithed the royal printing houle erected the palace afterwatds called L: Palisis Roral, which he prefented to the king; and rebuilt the Sorbonne vilh a magnificence that apfeirs truiy royal. Defides his buoks of controve-fy and piety, there go under the natne of this miniter, A Journal, in 2 vols 12 mo ; and a Political Teftament, in 12mo; all treatiog of politics and tate affairs. Cardi-
$\underbrace{\text { Kint. }}$ ral is izarine plafued Richlicu's plar, and complsted mant of the falemes which he had begun, buileft unfinifined.

1:IL INC'S, or falan Chfisti, in botany: A gerus if it : monodelphis order, beionging to the moruceiz clafs n! plants ; and in the numal method renking under $!$ ! 3 sth crder, Trivoce. The male caly $x$ is yuinguerartise; there is no corolla; the Ramina n:uracinus. The female cally is tripatite; there is no corolla, but threc bind fyles, with a :rilocular capfule, and a fingle fect. There are three fpecies, of which the mofl icmarkabic is the coamunis, or common $\therefore$ Inuton palma Chrilli. This tree is of a fpecdy growth, as in one
cxecffive drimine of new rum fill makes it fecgucrit amongte foidars, failors, :!nd the lower order of white people. Ithast een krown to harpen ton from vifceral obflructivis after intermittents, or marfh fevere, in J.maica.

The dicinus Arrericanus grows as tall as a little tree, and is io beautisul that Millar fays it deferves a place in erery curicus gard, n, and be planted it himfelf at Clielfea. It expands into natay branches; the leares are fometimes two feet in diameter, and the fiem as large as a middle-fized broom ftafi ; towards the top of the branch it has a ciufter of flowers, fomething refemWling a bunch of grapes; the Rowers are fmall and faminous, but on the body of the plant grow bunclies of rough triangular hufks, each comtaining three fpeckled feeds, generally fomewhat lefs than horfe beans; the thell is brittle, and contains white kernels of a fiweet, oily, and naufeous tafte. From this kernel the oil is extrated, and if the medicine fhould become officinal, the feeds may be imported at a reafonable rate, as the plant grows wild and in great plents in all the Britifh and French American iffands. Sce Oleval Palme Chrific. Of the ricinus communis there are a great many varicties ; all of them fine majeftic plants, annual, or at moft biennial, in Britain; but in their native foil they are faid to be perennial both in root and ftem. They are propagated by fecds fown on a hot-bed, and require the fime treatment as other tender exotics.

RICKETS, in medicine. Sce there, $n^{\circ} 347$.
RICOCHET, in gumnery, is when guns, howitzers, or mortars, are lnaded with fmall charges, and elevated from 5 to 12 degrees, fo as to fire over the parapet, and the thot or hell rolls along the oppofite rampart : it is called ricochet-fring, and the batteries are likewife called sicochit balt ries. This method of firing was firfe invented by M. Belidor, and firt ufed at the fiege of Ath in 1697 . This mode of firing out of mortars was firf tried in $1 / 23$ at the militaty fohool at Straburg, and with fucceis. At the batile of Rofbach, in 1757 , the king of Prutia had feveral 6 -inch mortars made wi:h trumions, and mounted on travel-ling-carriages, which fired obliquely on the enemy's lines, and amongft their horfe, loaded with 8 ounces of powder, and at an elevation of one degree 15 minutes, which did great cerecution ; for the fhelis rolling along the lines, with burning fuzes, made the foutef of tho enemy not wait for thcir burling.

RICOTIA, in botany: A genus of the filiquofa or der, belonging to the tetradynumia clafs of plants; and in the natural method ranking under the 39 th order, Siliquoja. The filiqua is un locular, oblong, and comprefled with plain valvules.

RIDGE, in agricwlture, a long piece of rifing land between two furrows. Sec Agriculture, $11^{D} 111$.

RIDGLING, or Ridgel, among farriers, \&c. the male of any bealt that has been but half-gelt.
RIDICULE, in matters of literature, is that fpecies of writing which excites contempt with laughter.

The ridiculous, however, differs from the rifibte, (fee Risibee.) A rifible object produceth an emotion of laughter merely: a ridiculous nbject is improper as well as rifible; and producth a mixed emotion, which is vented by a l.ugh of derifion or fenrn.

Burlefque, though a great engine of ridicule, is not confined to that fubject ; for it is clearly diftinguithable into burlefque that excitcs laughter mercly, and burlefque

## RID

Kidicule. burlefque that provokes derifion or ridiculc. A grave fubjeft in which there is no impropriety, may be brought dow by a certain colouring fo as to be ritible; which is the cafe of Virgil Traveflie, and alfo the cafe of the Secchia Repita; the authors laugh firt, in order to make their readers laugh. The Lutrin is a burlefque poem of the other fort, laying hold of a low and trifing incident, to expore the luxury, indolence, and contentious firit of a fet of monks. Boileau, the aythor, gives a ridiculous air to the fubject, by dreling it in the beroic ftyle, and affecting to confider it as of the utmoft dignity and importance. In a compofition of this kind, no image profefledly ludicrous ought to find quarter, becaufe fuch images deftroy the contrat ; and accordingly the author thows always the grave face, and never once betrays a fmile.

Though the burlefque that aims at ridicule produces its effects by elevating the tyle far above the fubject, yet it has limiss bejond which the elevation oughe not to be carried : the poet, confulting the imagination of his readers, ought to confine himelf to fuch images as are lively and readily apprehended: a Atrained elevation, foaring :bove an ordinary reach of fancy, makes not a pleafant impreffion: the reader, fatigued with being aliways upon the ftretch, is foon difgulted; and, if he perfevere, becomes thoughtlefs and indifferent.Further, a fistion gives no pleafure unlefs it be painted in colours fo lively as to produce fome perception of reality; which never can be done effectually where the images are formed with labour or difficulty. For thefe reatons, we cannot avoid condemning the Batrachomuosnachia, faid to be the compofition of Homer: it is beyond the power of imagination to form a clear and live$\mathrm{l}_{\mathrm{y}}$ image of frogs and mice acting with the dignity of the higheft of our fpecies; nor can we form a conception of the reality of fuch an action, in any manner fo diftinct as to intereft our affectons even in the lighteft degree.

The Rape of the Lock is of a character clearly diftin. guifhable from thofe now mentioned ; it is not properly a burlefque performance, but what may rather be termed an Leroi.comical poen: it treats a gay and familiar fubject with pleafantry, and with a moderate degree of dignity: the author puts not on a mank like Boileau, nor profeffes to make us laugh like Taftoni. The Rape of the Look is a genteel species of writing, lefs ftrained than thofe mentioned; and is pleafant or ludicrous without having ridicule for its chief aim ; giving way, however, to ridicule where it arifes naturally from a particular character, fuch as that of Sir Plume. Addi-
*N 102 . fon's $S$ peltator *, upon the exercife of the fin, is extremely gay and ludicrous, refembling in its fabject the Rape of the Lock.

There remains to fhow, by examples, the manner of teeating fubjects fo as to give thein a ridiculous appearance.

Il ne dit jamais, je vous donne, mais, je vous prete le bon jour.

Moliere.
Orlans. I know him to be valiant.
Confable. I was told that by one that knows him better than you.

Orleans. What's he?
Gonfable. Marry, he told me fo himfelf; and he faid, he cai'd not who knew it.

Herry V. Slakefpcars.

He nerer broke any man's head but his own, and Ridicule. that was againt a polt when he was drunk. Iotid:

Millamont. Semtentious Mirabel! prithee don't look with that vident and infexible wife face, hise Solomon at the dividing of the ch:ld in an old tapeftry hanging.

Way of the Worli.
A true crit:c, in the perufial of a book, is like a do ${ }^{\circ}$ at a feaft, whofe thoughts and ftomach are whelly fe ${ }^{\text {b }}$ upon what the gueft fling away, and confequently is apt to finarl molt when there are the feweft bones.

Tale of a Tub.
In the following infances, the ridicule arifes from abfurd conceptions in the perfons introduced.

Mrafiarille. Te fouvient-il, vicomte, de cette de. mi-lune, que nous emportames fur les enemis au fiege d'Afras?

Fodelet. Que veux-tu dire avec ta demi-lune? c'etoit bien une lune tout entiere.

Moliere, les Precicufes Ridicules, fc. ri.
Slander. I came yonder at Eaton to marry Mrs Anne Page ; and fhe's a great lubberly boy.

Page. Upon my life then you took the wrong-
Slander. What need you tell me that? I think fo when I took a boy for a girl: if I had been married to him, for all he was in woman's apparel, I would not have had him.

Miery Wives of Windfor.
Falentine. Your bleffing, Sir.
Sir Sampfon. You've had it already, Sir: I think I fent it you to day in a bill for four thoufand pound; a great deal of money, brother Forefight.
Forefiyht. Ay, indeed, Sir Sampron, a great deal of money for a young man; I wonder what he can do with it. Love for Love, act 2. fc. 7.
Millament. I naufeate walking; 'tis a country diverfion; I lothe the country, and every thing that relates to it.
Sir Wilfull. Indeed, hah! look ye, look ye, you do? nay, 'tis like yon may-here are choice of paftimes here in town, as plays and the like; that muft be confers'd, indeed.

Millament. Ah l'etourdie! I hate the town too.
Sir W'ifull. Dear heart, that's much-hah! that you flould hate 'em both! hah!'tis like you may; there are fome can't relifh the town, and others can't away with the country_-'tis like you may be one of thefe, Coufin. Way of the World, aet 4. fc. 4.

Lerd Fro:t. I affure you, Sir Paul, I laugh at nobody's jeits but my own, or a lady's: I affure you, Sir Paul.

Brijk. How? how, my Lord ? what, affront my wit? Let me perifh, do l never fay any thing worthy to be laugh'd at ?

Lard Froib. O foy, don't mifapprehend me, I don't fay fo, for I often fmile at jour conceptions. But there is nothing more unbecoming a man of quality than to laugh; 'tis fuch a vulgar expreflion of the paffions! every body can laugh. Then efpecially to laugh at the jeft of an inferior perfon, or when any body elie of the fame quality does not laugh with one; ridiculous! To be pleas'd with what pleafes the crowd ! Now, when I langh I always laugh alone.

Double Dealer, act I. fc. 4.

Ridicule.
So tharp-fighted is pide in blemithes, ard fo milling to be gratified, that it tades up with the very $\pi$ ghteft improprieies: luch as a blunder by af reigner in ipaking our language, elpecially if the blunder can bear a fente that relleets on the ipeaker:

2ais ${ }^{2} \mathrm{y}$. The young man is an honc ${ }^{2}$ man.
Cisius. What thall de honett man do in my clofet? dere is no honeft man dat thall come in mij clofet.

Mirry llites of Windfor.
Love fpecches are finely ridiculed in the following raffige,

Quuth lie, My faith as adamantine,
As chains of dentiny, ['ll maintain;
True as $A$ pollo ever fipole,
Or cracle from heat of oak;
Ard if you'll give my flume but vent,
Now in clofe hugger-mugger pent,
And fline upon me but benignly,
With that one and that other pigfney,
Thee fun and day fhall fooner part
Thar love, or you, flake off my heart;
The fun, that thall no more difpenfe
His own, but jour bright influence:
I'll carve your name on barks of trees,
With true lov- -nets and ilourifhes;
That thall infure eternal fpring, And everlalting flourithing:
1)rink eve:y letter on't in ftum, And make it brifk champaign become. Where'er you tread, your foot fhall fet The primaroie and the violet; Ail fices, perfumes, and fweet powders, Slall borrow from your breath their odours;
Ninture her charter fhall renew
And take all lives of things from ynu;
The world depend upon your eye,
And, when you frown upon it, die.
Only our loves fhall ftill furvive,
New worlds and natures to out-live;
And, like to herald's moons, remain All crefcerts, without change or wane.

Hudibras, part 2. canto I.
Thore who have a talent for :idicule, which is felLom united with a talte for delicate and refined beauties, are quick-fighted in impropriet:es; and thefe they eagerly grafp, in order to gratify their favourite propenlity. Perfons galled are provoked to maintain that ridicule is inçroper for grave fubjeets. Subjeets really grave are by no means fit for ridicule ; but then it is urged ags:int them, that, when called in queftion whether a certain fubjet be really grave, ridicule is the only means of determining the controvafy. Hence a celebrated queffion, Whether ridicule be or be not a teft of trith?

On one fide, it is obferved, that the objects of ridiculc are falfehood, incongrnity, impropricty, or turpitude of certain hinds: but as the object of every excited paffion mult be examined by reaton, before we can detcrmine whether it be proper or improper ; fo ridicule muf, ipparerily at le.th, eftablith the truth of the improprieties defigned to ewcite the pation of contempt. Hence it comes in to the aid of argument and : cafon, when its irnprefions on the imagination are confifent reith the nature of things; but when it Arikes the faicy
and affections with fatitious imarges, it heecmes the infirument of deceit. But however ridicule may imprefs the idea of apparent turpitude or falfehood in the imagination, yet llill reafon remains the lupreme judge ; and thus ridicule can never be the final tef or touchItone of truth and falfehood.

On the other fide, it is contended that ridicule is not a fubject of reafoning, but of fenfe or tafte; (fee and compare the articles Risible and CoxgrciTY). Stating the queftion, then, in more accurate terms, Whether the fente of ridicule be the proper tel for diftinguifhing a idiculous oljeats from what are not fo? they proceed thus: No perion doubts that our fenfe of beauty is the true teft of what is beautiful; and our fenfe of grandeur, of what is great or fublime. Is it more doubeful whether our fenfe of ridicnle be the true teft of what is ridiculous? It is not only the the true telt, but indeed the only teft; for this firbeet comes not, more than beauty or grandeur, under the province of reafon. If any fubject, by the influence of faftion or culfom, have acquired a degree of venc. ration to which maturally it is not intitled, what are the proper means for wiping off the artificial colouring, and difplaying the fubjeot in its true light? A man of true tafte fees the fubject without difguife; but :if he hefitate, let him apply the teft of ridicule, which feparates it from its artificial conne?tions, and expofes it naked with all its native improprieties.- But it is urged, that the graveft and moft ferions matters may be fet in a ridiculous light. Hardly fo; for where an object is neither rifible nor improper, it lies not open in any quarter to an attack from ridicule.

RIDING, in general, fignifics the being carried alont on any vehicle.

Riding on horfeback. See Horsemanship.
Riong, in medicinc. During this exercife all the vifcera are thaken, and preffed againit each other ; at the fame time the pure air adts with a greater force on the lungs. Weakly perfons, or thofe whofe ftomachs are infirm, fhould, however, be cautious of riding befure their meals are fomewhat digefted.

Ridi:g, in naval affairs, is the ftate of a thep's being retained in a particular ftation, by means of one or nere cables with their anchors, which are for this purpore funk into the bottom of the fea, \&c. in order to prevent the veffel from being driven at the mercy of the wind or current.-A rope is faid to ride, when one of the turns by which it is wourd about the captera or wiadlafs lies over another, fo as to intenupt the operation of heaving.

Riding Atbuart, the pofition of a mip which lies acrofs the direction of the wind and tide, when the former is foftrong as to prevent her from falling into the current of the latter.

Riding betaven the Wind and Tids, the fituation of a veiiel at anchor, when the wind and tide att apon her in direct oppofition, in fuch a manner as to dettroy the efiort of each other upon her hull ; in that the is in a mamer balancel between their reciprocal force, and rides without the leaft frain on her cables. When a thip does not labour heavily, or fe: a great frain when anchored in an open roud or bay. the is fatd $t$, ride cafy. On the contrary, when fle pitches violanily into the tea, fo as to ftrain her cables, maifts, or huil, it is called rillimg bard, and the oficl is termed ath radir.

## R'ding.

 $\underbrace{\sim}$ roader. A flip is rasely faid to ride when the is faftened at both the ends, as in a harbour or river, that lituation being comprehended in the article Monsing.Riding, a diftrict vifited by an officer - Yorthite is clivided into three ridings, viz. the eaft, weft, and north ridings. In all indictments it that county, both the town and riding mult be exprefled.

Rimino, as conneted with gardening, and fufces. lible of embellifment. See Gardening.

A riding, though in extent differing fo widely from a garden, yet agrees with it in many particular's for, exclufive of that community of charater which refults from their being both improvements, and both deftined , to pleafure, a clofer relation arifes from the property of a riding, to extend the idea of a feat, and appropriate a whole country to the manlion; for which purpofe it mult be diftinguifhed from common roads, and the marks of diftinetion mult be borrowed from a garden. Thofe which a farm or a park can fupply are faint and few; but whenever circumitances belonging to a garden occur, they are immediately received as evidence of the domain. The fpecies of the trees will often be decifive: plantations of firs, whether placed on the fides of the way, or in clumps or woods in the view, denote the neighbourhood of a feat: even limes and horfe-chernuts are not indifferent; for they have always been frequent in improvements, and rare in the ordinary fcenes of cultivated nature. If the riding be carried through a wood, the flrubs, which for their beauty or their fragrance have been traniplanted from the conntry into gardens, fuch as the fweet-briar, the viburnum, the cucnymus, and the wood-bine, fhould be encouraged in the underwood; and to thefe may be added feveral which are fill peculiar to fhrubberies, but which might cafily be transferred to the wildeft coverts, and would require no further care.

Where the fpecies are not, the difpofition may be marticular, and any appcarance of defign is a mark of improvement. A few trees flanding out from a hedgerow, raife it to an elcgance above common ruflicity' : and fill more may be done by clumps in a field; they give it the air of a park. A clofe lane may be decolated with plantations in all the little vacant fpaces: and even the groups originally on the fpot (whether it be a woud, a field, or a lane), if properly felected, and thofe only left which are elegant, will have an effect : though every beauty of this kind may be found in nature, yet many of them are feldom feen together, and never unmixed. The number and the choice are fymptoms of delign.
finother fymp:om is variety. If the appendages of the :iding be different in different fields, if in a lane, or a wood, fome diftinguilhing circumftance be provided for evcry bend; or when, carried over an open expofure, it winds to feveral points of view; if this be the conduct throughout, the intention is evident, to amufe the length of the way: variety of ground is alfo a charafteriftic of a riding, when it feems to have proceeded from choice; and pleafure being the purfuit, the changes of the fcene both compenfate and account for the circuity.

But a part undiftinguifhed from a common road, fucceeding to others moreadorned, will by the contraft alone be fometimes agreeable; and there are beauties frequent in the higls-way, and almo! peculiar to it,
which may be very accept ible in a riding: a green lane
Riding. is always delightful ; a palage winding between thiekets of brambles and briars, iomctimes with, fometimes wihhcut a little fpri gr-wool rifing amonght hem, or a cut in a continued fucep through the furze of a down or the forn of a hea:h, is gencrally pleafant. Nor will the characer be abfolutely lof in the interruption, it vill fonis be refumed, and never forgotten; when it las bicn once Rrongly impreffed, very fight means will preferve the itca.

Simplicity may prevail the whole length of the way when the way is all naturally pleafant, but efpecially if it be a communication between feveral fpots, which in character are raifed above the reft of the country: A fine open grove is unufual, except in a park or a garden; it has an elegance in the difpofition which cannot be attributed to accident, and it feems to require a degree of prefervation beyond the care of mere hufoandry. A neat railing on the edge of a fteep which commands a profpect, alone diftinguifhes that from other points of view. A building is fill more flrongly characteriftic: it may be only ormamental, or it may be accommodated to the reception of company; for though a place to alight at interrupis the range of a riding, yet, as the object of an airing, it may often be acceptable. A fmall fpot which may be kept by the labour of one man, inclofed from the fields, and converted into a fhrubbery or any other fcene of a garden, will fometimes be a pleafing end to a fhort. excurfion from home : nothing fo effectually extends the idea of a feat to a diftance; and not being conftantly vifited, it will always rctain the charms of novelty and variety.

When a riding is carried along a high road, a kind of a wiiof property may in appearance be claimed even there, lage. by planting on both fides trees equidifant from each other, to give it the air of an approach : regulatity intimates the neighbourhood of a manfion. A village therefore feems to be within the domain, if ary of the inlets to it are avenucs: other formed plantations about it, and fill more trivial circumftances, when they are evidently ornamental, fometimes produce and always corroborate fuch an effect ; but even without raifing this idea, if the village be remarhable for its beauty, or only for its fingularity, a paflage through is may be an agreeable incident in a riding.
The fame ground which in the fields is no more than rough, often ieems to be romantic when it is the fite of a village; the buildings and cther circumftances mark and aggravate the irtegularity. To frengthen this appearance, one cottage may be placed on the edge of a feep, and fome winding feps of unhewn ftone lead up to the door; another in a hollow, with all its little appurtenances hanging above it. The pofition of a fc w trees will fometimes anfwer the fame purpole; a footbridge here and there for a communication between the fides of a narrow dip, will add to the character ; and if there be any rills, they may be conducted fo as great${ }^{1} 5$ to improve it.

A village which has not theefe advantages of ground, mar, however, be beautiful; it is diftinguithed by its elegance, when the larger intervals between the houfes are filled with open groves, and little clumps are introduced upon other occafions. The church often is, it generally may be, made a picturefque object. Even the cottages may be neat and fometimes grouped

## R I D

Riding. with thicke!s. If the place be watered by a ftream, the crollings may be in a varicty of plafing deligns: and if a fpring rife, cr only a well for common ufe be luak by the fide of the way, a little ecrering over it may be contrived which thatl at the fame time be lim. ple and preity.

There are few villwes which may not eafily be rendered agreeable. A imall alteration in a houfe will formatimes oceation a great difference in the appearance. By the lieip of a few triling plantations, the onefes which have a good effer may be flown to advatioge, th fe which have nct may be cuncealed, and fuch as are fimilar be difguifes. And any form which affends the cye, whether of gromid, of trees, or of buildings, may fumetimes be broken by the flighteft ciramallances, by an advanced paling, or only by a tench. Variety and beauty, in fuch a luljezt, are :ather the effects of attention than expence.

Of wie
tuild nes defigned
ror objeats i) a ricing.

But if the parige through the village cannot be pleasant; if the buildings arc all alike, or ftand in unmeaning rows and fimilar fituations; if the place furnithes ro opportuaties to contralt the forms of dwellings with thofe of out-houfes; to introduce trees and thickets; to interpofe fields and meadows ; to mix larms with cottages; and to place the feveral objects in difforemt pofitions: yet on the cutfide even of fuch a village there certainly is room for wood; and by that alone the who.e may be grouped into a mals, which thall be agrecable when fkirted by a riding; and fill more fo when feen from a diftance. The feparate farms in the filds, alfo, by planting fome trees about them, or perhaps only by managing thofe already on the fpot, may be made very interelting objeets; or if a new one is to be built, beauty may be confulted in the form of the houfe, and the difpofition of its appurtenances. Sumetimes a character not their own, as the femblance of a calle or an abbey, may be given to them; they will thereby acquire a degree of confideration, which they camnot otherwife be entitled to: and objects to improve the views are fo important to a riding, that buldings mult fometimes be erested for that purpofe only: but they thould be fuch as by an atual effect adorn or dignify the fcene; not thofe little flight deceptions which are too well known to fucceed, and have no merit if they fail : for though a fallacy fometimes contributes to fupport a clarader, or fuggelts ideas to the imagination, yet in iffelf it may be no improvenent of a fcene; and a bit of turret, the tip of a foire, and the o:her ordinary futjects of thefe frivolous attempts, arc fo infignificant as oljects, that whether they are real or fictitious is almoft a matter of

Ofagarden fimilar in character to a ridus

The fame means by which the profpects from a riding are improved, may be applied to thofe from a garden; though they are not effentid to its character, they are important to its beauty; and wherever they abound, the extent only of the range which commands thent, determines whether they flall be feen from a riding or a garden. If they belong to the latter, that affumes in fome degree the predominant properties of the former, and the two charalaers approach
very near to each other : but till each has its peculiarities. Progrefs is a prevailing idea in a riding; and the picalantnefs of the way is, therefore, a principal confideration : but particular fots are more attensed to in a garden; and to them the communications oughe to be fubordinate; their direction mult be generally accommodated, their beauties fometimes ficrificed to the fituation and the charafter of the feenes they lead to ; an advantageous approacta to thefe murt be preferred to an agrceable line for the walk; and the circumftances which might otherwife become it are mifplacel, if they anticipate the openings: it thould fometimes be contrafted to them; be retired and dark: if they are fplendid or gay, and fimple if they are richly adorned. At other times it may burft unexpectedly out upon them; n:ot on account of the furprife, which can have its effect only once; but the impreffions are fronger by being fudden; and the contraft is enforced by the quicknefs of the tranfition.

In a riding, the feenes are only the amufements of the way, througn which it proceeds without Itopping: in a garden they are principal; and the fubordination of the walk raifes their importance. Every art, therefore, thould be exerted to make them feem parts of the place. Difant frofpets cannot be fo: and the alienation does not offend us; we are familiarized to it: the extent forbids every thought of a clofer conneftion; and if a continuation be preferved between them and the points which command them, we are fatisfied. But bomerviezus fuggen other ideas; they appear to be with. in our reach : they are not only beautiful in profpest, and we can perceive that the \{pots are delightiul ; but we wilh to examine, to inhabit, and to enjoy them. Every apparent impediment to that gratification is a difappointment ; and when the feenes begin beyond the opening, the confequence of the place is lowered ; nothing within it engages our notive: it is an exhibition only of beauties, the property of which does not belong to it ; and that idea, though indifferent in a riding, which is but a paflage, is very diladvantageous to fuch a refidence as a garden. To obviate fuch an idea, the points of view thould be made important; the objects within be appendages to thofe without; the feparations be remored or concealed; and large portions of the garden be annexed to the fpots which are contiguous to it. The ideal boundary of the place is then carried beyond the fcenes which are thus appropriated to it ; and the wide circuit in which they lie, and the different pofitions in which they may be thown, affori a greater variety than can generally be found in any garden, the feenery of which is confined to the inclofure.

Persfield (a) is not a large place ; the park con-Deferip tains about 300 acres; and the houle llands in the midit tion of of it. On the fide of the approach, the inequalities of l'crisficls. the ground are gentle, and the plantations pretty; but nothing there is great. On the other fide, a heautiful lawn falls precipitately every way into a deep vale which fhelves down the middle; the declivities are divertified with chmps and with groves; and a number of large trees fraggle along the boton. This lawn is cneom-

## R I D

## Kiding.

paffed witl wood; and through the wood are walks, which open beyond it upon thofe romantic fcenes which furround the park, and which are the glory of Persficld. The Wye runs imniediately below the wood: the river is of a disty colour ; but the fhape of its courfe is very various, winding firt in the form of a horfe-fhoe, then proceeding in a large fweep to the town of Cheptowe, and afterwards to the Severn. The banks are high hills; in different places fteep, bulging out, or hollow on the fides; rounded, flattened, or irregular at top; and covered with wood, or broken by rocks. They are fometimes feen in front; fometimes in perfpective; falling back for the paffage, or clofing behind the bend of the river; appearing to meet, rifing above, or flouting out beyond one another. The wood which inclofes the lawn crowns an extenfive range of thefe hills, which overlook all thofe on the oppofite fhore, with the country which appears above cr between them ; and winding themfelves as the river winds, their fides, all rich and beautiful, are al. ternately exhibited; and the point of view in one fpot becomes an object to the next.
In many places the principal feature is a continued rock, in length a guarter of a mile, perpendicular, high, and placed upon a height. To refemble ruins is common torocks: but no ruin of any fingle fructure was ever equal to this enormous pile; it feems to be the rematins of a city; and other fmaller heaps fcattered about it appear to be fainter traces of the tormerextent, and frengthen the fimilitude. It ftretches along the brow which terminates the forelt of Dean; the face of it is compofed of immenfe blacks of ftone, but none rugged; the top is bare and uneven, but not craggy; and from the foot of it, a declivity, covered with thicket, flopes gently towards the Wye, but in one part is abruptly broken off by a ledge of rocks, of a different hue, and in a different direction. From the grotto it feems to rife immediately over a thick wood, which extends down a hill below the point of view, acsofs the valley through which the Wye flows, and up the oppofite banks, hides the river, and continues without interruption to the bottom of the rock : from another feat it is feen by itfelf without even its bafe; it faces another, with all its appendages abour. it ; and fometimes the fight of it is partially intercepted by trees, beyond which, at a diftance, its long line centinues on through all the openings betreen them.

Another capital object is the caftle of Chepltowe, a noble ruin of great extent; advanced to the very edge of a perpendicular rock, and fo immediately rivetted into it, that from the top of the battlements duwn to the river feems but one precipice: the fame ivy which overfpreads the face of the one, twines and clufters anonig the fragments of the other; many towers, much of the walls, and large remains of the chapel, oare ftanding. Clofe to it is a moft roman:ic wooden bridge, very ancient, very grotefque, at an extraordinary height above the river, and feeming to abut againft the ruins at one end, and fome rocky hilis at the other. The cafte is fo near to the alcove at Persfield, that little circumitances in it may be difcerned; from other fpots more diftant, even from the lawn, and from a fhrubbery on the fuie of the lawn, it is dittinctly vifible, and al. ways beartiful, whecher it is feen alone, or with the bridge, with the town, with more or with lefs of

Vol. XVI.
the rich meadows which lie along the banks of tise Wye, to its junction three miles off with the Severn. A long fweep of that river alfo, its red cliffs, and the fine riting country in the counties of Somerfet and Gloucefter, generally terminate the profpect.

Mon of the hills about Persfield are full of rocks; fome are intermixed with hanging woods, and either advarce a litlle before them, or retire within them, and are backed, or overhung, or feparated by trees. In the walk to the cave, a long fucceffion of them is frequently feen in perfpective, all of a dark colour, and with wood in the intervals between them. In other parts the rocks are more wild and uncouth; and fometimes they ftand on the tops of the highoft hills; at other times down as low as the river ; they are homely objects in one fpot, and appear only in the back-ground of another.

The woods concur with the rocks to render the fcenes of Persfield romantic: the place everywhere abounds with them; they cover the tops of the hills; they hang on the feeps; or they fill the depths of the valleys. In one place they front, in another they rife above, in another they fink below the point of view ; they are feen fometimes retiring beyond each other, and darkening as they recede; and fometimes an opening between two is clofed by a third at a diftance berond them. A point, called the Lover's Leap, commands a continued furface of the thickeft foliage, which nverfpreads a valt bollow immediately underneath. Below the Chinefe feat the courfe of the Wye is in the Mape of a horfe-fhoe: it is on one fide inclofed by a femicircular hanging wood; the direct fteeps of a table-hill fhut iv in on the other ; and the great rock fills the interval between them : in the midft of this rude fcene lies the peninfula formed by the river, a mile at the lealt in length, and in the higheft fate of cultivation: near the ifthmus the ground rifes confiderably, and thence defcends in a broken furface, till it flattens to the water's edge at the other extremity. The whole is divided into cornfields and paltures; they are feparated by hedge-rown, coppices, and thickets; open clumps and fingle trees fand out in the ineadows; and houfes and other buildings, which belong to the farms, are fcattered amongit them: nature fo cultivated, furrounded by nature fo wild, compofe a moft lovely landicape toge. ther.

The communications between thefe feveral points are generally by clofe walks; but the covert ends near the Chinefe feat ; and a path is afterwards conducted through the upper park to a ruftic temple, which overlooks on one fide fome of the romantic views which have been defcribed, and on the other the cultivated hills and valleys of Monmouthfire. To the rude and magnificent feenes of nature now fucceeds a pleafant, fertile, and beautiful country, divided into inclofures, not covered with woods, nor broken by rocks and precipices, but only varied by eafy fwells and gentle declivities. Yet the profpec is not tame: the hills in it are high ; and it is bounded by a valt fweep of the Severn, which is here vifrble for many miles tngether, and receives in its courfe the $W$ ye and the Avon.

From the temple a road leads to the Windcliff, an eminence much above the reft, and commanding the whole in one view. The Wye runs at the foot of the hill ; the peniufula lics jutt belon; the deep bofom of

RIDLIJ (Niaholas), Lil?op of London, and a matyr to the Reiormation, wis delcended of an ancient fanmily, and born is the beginning of the 1 Gth ceanury, at Trilmontfwick in Northumberland. From the grommardichol at Newcalle upon Tyne, he was ient to Pembroke hall in Cambrisge, in the jear 1;18, where le was fupported by his nncle Dr Robert Rid1:5, Tellow of Queen's college. In 1,522 he took his firlt degrec in arts; two years alter, was elected fellow; and, in 1525 , he commenced malter of arts. Iu $15=2$, having taken orders, he was fent by his uacle, for further improvement, to the Sorbonne at Paris ; Irna thence he went to Lourain, and continued abroad till the year 1529. On his return to Cambinge, he was chofen monder-treafurer of the univertity ; and, in 1533 , was elected fenior proctor. He afterwards preceeded bachelor of divinity, and was cholen chaphain of the univerfity, orator, and mayifer slomerie. It this time he was much admired as a preacher and difputant. He lolt his kind uncle in 1536 ; but was toon after patroniled by Dr Cranmer, archbithop of Canterbury, who made him his domeltic chaplan, and prefured him to the vicarage of Herne in Eat Kent; where, we are told, he preached the doctrine of the Efformation. In $15+0$, having commenced doftor of divinity, he was made king's chaplain; and, in the fime year, was elected matter of his college in Cam. bridge. Sion after, Ridley was collated to a prebend in the church of Canterbury; and it was not long betive he was acculed in the bihop's count, at the inftigration of bifhnp Gardiner, of preaching againft the llotring of the Six A-ticles. The mattor being refarred to Cranmer, Ridley was acquited. In $15+5$, he was made a prebendary of Weftmintter abbey; in 1547 was prelented, by the fellows of Pembrokehall, to the living of Soham, in the diocefe of Nor*ich; and the fame year was confecrated bithop of R achefler. In 1550 he was trandated to the fie of London; in which year he was one of the emmitioners for exitmining bithop Gardiner, and concurred in his deprivaion. In the year 1552, nur prelate returning from Canbridge, unfurtunately for himelf, pad a rint to
 prompten! by has zeal for intumation, he eaprelided himfili wih too rusch freedan; for the was fiarcely ferted on the throne when Risley x:b do med a vifim to her revenge. RIGA, at larye, ftrcus, prpulous, and rich town of the kufinn empire, and capital of Livonia. It is a large irading phace, iand has a very confiderable forWels ; the trabe is chictly in corn, fkins, leather, and naval fores. It was takem by the Rufians in 1710 , after they had blocied it up a long while, during which the inhabitants vore aflicted with the plague. The callle is fipare, and defended by four towers and fix ballions; belides which, it has a fine arfenal. The Proteftants have fill a handiome college here. It is feated on a large plain on the siver Dwina. E. Long. 24. 25. N. Lat 57.C.

RIGADOON, a gay and brifk dance, borrowed originally from Provence in Irance, and performed in figure by a man and woman.

RIGGING of a Sintr, 2 gencral name given to all the ropes employed to firpport the malts, and to extend or reduce the tails, or arrange them to the difpolition of the w.at. The former; which are uled to fultain the malt, remain utually in a fixed pofition, and are called llanding rigging; fuch are the Throuds, fays, and back-1tays. 'The littter, whofe office is to manage the fails, by communicating with various blocks or pulleys, fituated in diflerent places of the mats, yards, flurouds, ci:c. are comprehended in the general term of ranning risging; fich are the braces, fleets, huliards, clue-lines, brails, Sic.

In risging a maft, the finf thing ufually fixed upon its head is a circular wreath or rope, called the gromet, or collur, which is fimly beat down upon the top of the hounds. The intent of this is to prevent the fhrouds from being fretted or worn by the trillle-trees, or fhoulders if the matt ; after this are laid on the two pendents, fiom whofe lower ends the main or fo:e tackles are fufpended; and neat, the fhrouds of the Itarboad and larboard fide, in pairs, alternately. The whole is covered by the thays, which are the largett ropes of the ligging. When a yard is to be rigged, a gromet is alho driven firlt on each of its extremities; next to this are fited on the horfes, the braces, and lably the lifts or top- fail lheet-blocks.

The pincipal objects to be confidered in rigging a thip, appear to be flrength, convenience, and limplicicy: ( $r$, the properties of affording fufficient fecmity to the mants, yards, and fails; of arranging the whole machinery in the mof adrantugeous manner, to firftain the malts, and facilitate the management of the fails ; and of avoiding perplexity, and rejeting whatever is fuperlluous or mnecellary. "The perfertion of this art, then, confifts in retanings all thofe qualitics, and in preferving a judiciuas n.cdium between them. See Smp-nuildi:c.

RIGH'T, in geometry, fignifies the fanme with Praight; thus, a fraight line is called a risht one.

Rigur is a vithe conferred, 1. 'Together with Retermet, upen all bifhops. 2. Together with Honouralie, up nearls, vicounts, and buons. 3. By courtely, tozether with lifnowabli, upon the fons of dukes, mar-

quiffes, and the eldeft fons of earls. 4. Togetlier with Honourable, to the fpeaker of the houfe of commons; but to no other commoner excepting thofe who are members of his majefty's mof honourable priry-council; and the three lord mayors of London, York, and Dublin, and the lord proved of Edinburgh, durines their office. Sez Honourible and Provost.

Horditary Right. See Hereditary.
Rraht is a word which, in the propriety of the Englifh haguage, is ufed fometimes as an adjcetive and femetimes as a jubfantive. As an adjective it is rearly of the fare import with fi, fuitall, b.coming, figser: and whilf it expreffes a quality, it indicates a relation*. Thus when we fay that an action is right, we mult rot only know the nature of the action, but, if we fpeak intelligibly, muft alfo perceive its relation to the end for which it was ferformed; for an action maly be right with one end in view which would be rurong with znother. The conduct of that general would be right, who, to fave an army that could not be otherwife faved, fhould place a fmall detachment in a ftation where he knew they would all be inevitably cut off; but his conduct would be very aurong were he to throw away the life of a fingle individual for any purpofe, however important, which he knew how to accomplifh without fuch a facrifice.

Many philofophers have talked of actions being riglit and wrong in the aboftant without regard to their natural confequences; and converting the word into a fubflantive they have fancied an eternal rule of right, by which the morality of human conduct is in every particular cafe to be tried. But in thefe phrafes we can difcover no meaning. Whatever is right muft be fo on fome accunt or otlier; and whatever is fit, muit be fit for fome purpofe. When he who relts the foundation of virtue on the moral fenfe, fpeaks of an action being right, he muft mean that it is fuch as, through the medium of that fenfe, will excite complacency in the mind of the agent, and gain to him the general approbation cf mankind. When he who eefts moral obligation on the will of God, fpeaks of fome actions as rigkt and of others as surong, he muft mean that the former are agreeable to the divine will, however made kno:vn to men, and the latter difagreeable to it ; ard the man who deduces the litws of virtue from what he calls the finefs of things, muft have fome end in vieru, for which things are fit, and denominate actions right or curchy as they tend to promote or counteraf that end.

But the word right, ufed as a fuoftantive, has in com. mon as well as in plifo.oplaical languatre a fignification whichat firt view appears to be very different from this. It denotes a juffloim cr antoreft pofieflen. Thus we fay, a Iather lias a right to reverence from his children, a hufornd to the love and fidelity of his wifc, ard a king to the allegiance of $l$ is fubjects. But if se trace thefe "ghts to their furce, we thatl find that the; are all laws of moral obligation, and that they are called rists only becaufe it is agrecable to the will of Ciod, tor the in. finctive distates of the moral fenie, or to the fitncis of li.ings, if fuch a phrafe has any meaning, that chitdren geverace their paren:s, that wives love their lufbands, and that iubjects pay alligiance to their fovereign. This sill be arparent to any man who fall put to himelf lich queftions as the fe: " $\mathrm{W} / \mathrm{l} / \mathrm{y}$ have parciots a $\ddot{i n}^{\prime} \mathrm{f}$ ( 10 revererce from iheir chiddren, lumbuns to the ic in ct
their wives, and forereigns to the allegiance of their fubjests :" As thefe quettions contain in thom nothirg abfurd, it is obvicus that they are cach capable of : precife anfwer ; but it is impofible to give to ans $\left(f^{*}\right.$ them an anfwer which fhall have any meaning, and rot imply that rigkt and cefigation are reciprocal, or, in other words, that wherever there is a right in one s:rfor, there is a correfponding sbligation upon cthers. Thus to the queltior, "Why have parents a right to revcrence from their childron ?" it may be anfwered, "becaufc, under God, they were the authors of their chil. dren's being, and prote\&ted them from danger, and furnifhed them with neceffaries, when they were in a fate fo belplefs that they could do nothing for themfelves." This anfwer conveys no other maning than that theie is an obligation upon children, in retu:n for benelits received, to revetence their parents. But what is the fource of this obligation? It can only be tlie will of God, the moral fenfe, or the fitnefs of things.

This view of the nature of right will enabie us to form a proper judgment of the affertion of a late writer, "that man has no rights." The arguments by wich Godw'n's this apparent paradox is maintained, are not merely in- Pulitical genious and plaufible; they are abfolutely conclufive. Juftice. But then our philofopher, who never choofes to travel in the beaten track, takes the word right in a Cenfe ve. ry different from that in which it has been ufed by all other men, and confiders it as equivalent to difcretionury pozecr. "By the word right (fays he) is undertood a full and complete power of either doing a thing or omitting it, without the perfon's becoming liable to animadverlion or cenfure from another; that is, in other words, without his incurring any degree of turpitude or guilt." In this fenfe of the word he affirme, and affirms truly, that a man has no rights, no difcretionary power whatever, except in things of fuch total indifference as, whether "he fiall fit on the right or on the left fide of his fire, or dine on beef to day or to-merrow."

A propofition fo evidently true as this, food not in need of argument to lupport it ; but as his arcुuments are clearly expreffed, and afford a complete confutation of fome popular errors fanctioned by the refpectable phrafe rights of man, we fhall give our readers an opportunity of fudying them in his own words.
" Political fucicty is founded on the principles of morality and juthice. It is imponible for intellectual beings to be brougla into coalition and intercourfe without a certan mode of conduct, adapied to their nature and conncfiun, immediately becoming a duty inc:ambent on the parties concerned. Men would nerer have afincinted if they had not imagined that, in consequence of $t$ at atountior, they wriuld mu:naily conduce $($ - $)$ the advantare and happinets of each othe:. This is the re.i puspore, the genuine balis, of their i:iteroumfe and, as for as this purpofe is anfwered, fo. far does liociziy anforer the cad of is infitution. 'llane is oniy one poikhate more that is noceifary to bring us t. a cunchitive mole of reafoning upon this fubjec. Whatere: is meant by tio ie:m right, there canmeither be eppofie righte, roir ri, ytsand duties loolile to each otik:. 「"le rizlts of one man carnot clath will or bz de:rufive rfter riter of anorther: for this, infeat of

Teip. If anderfand it to be, would he to reduce it to a heap - is minse ligubie jargon and inconfitency. If cue man lave at right to be fice, another man cannot have a right to make him a flave ; if one man have a tight to indiat chaniement upon me, I cannot have a rug.t to withdraw mieli from chattifement ; if my neighbour have a righe to a fum of money in my polfefion, I cannot Inve a right to retain it in my pocket. It cannot be lets inccnitrovertible, that I have no right to nmit what my duty preferibes. From hence it inevitably follows that men have no rights.
"It is commonly faid, ' that a man has a right to the difpolal of his fortute, a right to the employment of his time, a right to tie mincontrolled choice of his jrate!!inn or purfiuts.' But this can never be confiftchity afirmed till it can be thown that be has no duties ruefriling and limiting his mode of proeeding in all theferefpeets.
"In reality, nothing can appear more wonderful to at careful inquirer, than that two ideas fo incompatible as $n$ an and rifies fhould ever have been affociated toge:sither. Certain it is, than one of them mult be utterly iseluliye and aminilatory of the oher. Before we afcribe rights to man, we muft conceive of him as a 1 cing enduwed wihl intellect, and capable of diferning the diffrences and rendencies of things. But a being endowed with intellect, and e.pable of difcerning the dreierences and tendencies of things, inllantly becomes a moral being, and has dutics incumbent on him to difiharge: and duties and rights, as has already been fhow, are abfolutely exclufive of each other.
"It has been affirmed by the zealous advocates of liberty, 'that princes and magifrates have no rights;' and r.o pofition can be more incontrovertible. There is no fituation of their lives that has not its correfpondent duties. There is no power intrufed to them that they are not bound to exercife exclutively for the public good. It is ftrange, that perfons adopting this principle did not go a Atep faither, and perceive that the fame reltictions were applicable to fubjects and citizens."

This reafoning is unanfwerble; but it militates not againft the rigbts of man in the ufval acceptation of the words, which are never employed to denote diferetionary power, but a juft claim on the noe hand, implying a correfponding obligation on the other. Whether the phrafe be abfilutely proper is not worth the debating; it is au:horifed by cuftom-the jus et norma loquandiard is univerfally underfood except by fuch as the dæmons of fation, i: the form of paradnxical writers on pr Itical juftice, have been able to millead by fophiftical reafonimgs.

Riglits, in the common acecptation of the word, are of various kinals: they are natural of advent tions, alienulie or uniabicnabice, perfeal or imperfea, particular or gerera\%. Sce the article L.astriy.

1y deprive him of any one of them, would be guity of a breach of the divitic law, as well as aet incomittemly with the fienefs things in cuery fenfe in which that phrafe can polibly be underflood.
Adventitious rights are thofe which a king has over his fubjects, a general over his foldiers, a hufband to the perfon and affections of his wife, and which every man has to the greater part of his property. That the righ:of the king and the general are adventitions, is univerfully admitted. The rights of property have been confidcred elfewhere (fee Property) ; and though the human conftitution thows fufficiently that men ard women have a natural right to the ufe of each other, yet it is evident that the exclufive right of any one man to any one woman, and vice verfa muit be an adventitious right: But the important queltion is, How are adventitious rights acquired?

In anficer to this queftion, the moralift who deduces How" acthe laws of virtue from the will of Cod, obferves, that gunde as God appears from his works to be a benevolent Being, who wills the happinefs of all his creatures (fiee Mefaphysics, $n^{0}$ 3tz.), he muft of courfe will every thing which naturally tends to promote that happincfis. But the exiftence of civil fociety evidently contrioutes in a great dgree to promote the fum of human happinetis (Sec Society) ; and therefore whatever is neceifary for the fupport of civil faciety in general, or for the conduct of particular focicties alroady effablifhed, mull beagreeable to the will of God: But the allegiance of fubjects to their fovereign, the obedience of foldiers to their leader, the protection of private propcrty; and the fulfilling of contracts, are all ablolutely necellary to the fipport of fociety; and hence the rights of kings, generals, hufbands, and wives, \&c. though adventitious, and immediately derived from human appointment, are not lefs facred than natural rights fince they may all be ultimately traced to the fame fource. The fame conclufion may eafily be drawn by the philofopher, who refts moral obligation on the fitnefs of things or on a moral fenfe; only it muft in each of thefe eafes partalic of the inftability of its foundation.

To the facrednefs of the rights of marriage, an aun- Objeceiors thor already quoted has lately urged fome declamatory to fome of objedions. "It is ablurd (fays he) to expeet, that the inclinations and wifhes of two human beings thould coincide through any long period of time. To oblige them to af and to live together, is to fubjeet them to fome inevitable portion of thwarting, bickering, and unhappinefs. This cannot be otherwife, a long as man has failed to reach the itandard of abfolute perfection. Ithe fuppotition that I mult have a companion for life, is the refult of a complication of vices. It is the diftate of cowardice, and not of fortitude. It flows from the defire of being loved and efteencal for fomething that is not defert.
"But the evil of marriage, as it is pracifed in European countries, lies deeper than this. The habit is, for a thoughtlefs and romantic youth of cach fex to come togethicr, to fee each other for a few times, and under circumitances full of delufion, and then to vow to each other eternal attachment. What is the corfequance of this : In almolt every inftince they find themfelves deceives. They are reduced to nake the beft of an irretrievable miftake. They are prefented with the frongel imaginable temptation to become the dupes.

## R I G [ 245 ] R G

of falfehood. They are led to conceive it their wifent policy to thut their eyes upon realities; happy if by any perverfion of intelleat they can perfuade thentelves that they were sight in thair firft crude opinion of their com: panion.
"So long as two human beings are forbidden by pofitive intitution to follow the diftates of their own mind, prejudice is alive and vigorous. So long as I leek to engrofs one woman to myfelf, and to prohibit my neighbour from proving his fuperior defert and reaping the fruits of it, I am guilty of the molt odious of all monopolies. Over this imaginary prize men watch with perpetual jealoufy; and one man will find his defires and his capacity to circumvent as much excited, as the other is excited to traverfe his projects and fruftrate his hopes. As long as this fate of fociéty continues, philanthropy will be croffed and checked in a thoufand ways, and the flill augmenting ftream of abufe will continue to flow.
"The abolition of marriage will be attended with no evils. The intercourfe of the fexes will fall under the fame fytem as any other fpecies of friendihip. Exclufively of all groundlefs and ablinate attachments, it will be impoffible for me to live in the world without tinding one man of a worth fuperior to that of any wher whom I have an opportunity of obferving. To this man I thall feel a kindnefs in exact proportion to my apprehention of his worth. The cafe will be precifely the fame with refpect to the female fex; I fhall allid:ounf cultivate the intercourfe of that woman whofe accompliihments fhall frike me in the mof powerlul manner. 'But it may happen that other men will feel for her the fame preference that I do.' This will create no difficulty. We may all enjoy her converfation; and we fhall all be wife enough to confider the fenfual intercourfe as a very trivial object. This, like every other affuir in which two perfons are concerned, mult be regulated in each fuccefive infance by the un. forced confent of either party. It is a mark of the extreme depravity of our prefent habits, that we are inclined to fuppofe the fenfual intercourle anywife material to the advantages ariting from the pureft affection. Reafonable mer now eat and drink, not from the love of p'eafure, but becaufe eating and drinking are effential to our heaithful exilience. Reafonable men then will propagate their fpecies, not becaufe a certain fenfithle pleafure is annexed to this action, but becaufe it is right the fpec:es foould be propagated and the manner in which they exereife this function will be regulated by the difates of reafon and duty."

It is tight then, according to this political innovator, that the fipecies thould be propasated, and reafonable men in his Uoopian commonwealth would be incited by renfon and duty to propagate them: but the way to fulfi this duty, experience, which is feldom at one with fpeculative reformation, his already demonftrated, not to confift in the promifcuons intercourfe of feveral men with one woman, but in the fidelity of individuals of the two fexes to each other. Common proflitutes among us feldom prove with child; and the fociety of Arreoys in Otaheitee, who have completely divefted themfelves of what our author calls prejudice, and are by no means guilty of his mofl odious of all monspolies, are for the moft part childlefis (Sce Otaheitee). He feems to thin's that a fate of equal pr juerty would ne-
ceflarily deftroy our relilh for luxury, decreafe our inordinate appetites of every kind, and lead us univerfally $\underbrace{\text { Rihgt. }}$ to prefer the pleafures of intellect to the pleafures of fenie. But here again experience is againft him. The Arreoys who have a property in their women perfectly equal, are the moll luxurious and fenfual wretches on the face of the earth; fenfual indeed to a degree of which the mof libidinous European can hardly form a conception.

By admitaing it to be a duty to propagate the fpecies, nur author muft neceffarily grant that every thing is right which is requifite to the fulfilling of that duty, and the contrary wrong. If fo, promifcuous concubinage is wrong, fince we liave feen, that by a law of nature it is incompatible with the duty; whence it follows on his own principles, that the fexual union by pairs mutt be right. The unly quefion therefore to be decided between him and his opponents is, "Whether fhould that union be temporary or permanent?" And we think the following obfervations by Mr Paley fufficient to decide it to the convistion of every perfon not blinded by the rage of innovation.
"A lawgiver, whofe comfels were diretted by views of general utility, and obftructed by no local impediments, would make the marriage-contract indifoluble during the joint lives of the part es, for the fake of the following advantages: Such a union tends to preferve peace and concord between married perfons, by perpetuating their common intereft, and by inducing a neceflity of mutual compliance. An earlier termination of it would produce a feparate intereft. The wife would naturally look forward to the diffolution of the partuerlhip, a:id endeavour to draw to herfelf a fund againft the time when fhe was no longer to have accefs to the fame refnurces. This would beget fpeculation on one fide, and miltrult on the other; evils which at prefent very little difturb the confidence of married life. The fecond effect of making the union determinable only by death, is not leís beneficial. It neceffarily happens, the adverfe tempers, habits, and taftes, oftentimes meet, in marriage. In which cafe each party muft take pains to give up what offends, and pracice what may gratify, the other. A man and woman in love with each other do this infenfibly: but love is neither general nor durable; and where this is winting, no lefions of duty, no delicacy of fentiment, will go half fo far with the generality of mankind and womankind as this one intelligible reflection, that they muft each mate the beft of their bargain; and that fecing they mult either both be miferable or both thare in the fame happinefs neither can find their own comfort but in promoting the pleafure of the other. There compliances, though at firf extorted by neceflity, become in time ealy and mutual; and though lefs endearing than affiduities which take their rife from affection, generally procure to the married pair a repofe and fatisfaction fufficient for their happinets."

So differently from our author does this judicious writer reafon concerning the effects of a permanent union on the tempers of the married pair. Inflead of fubjecting them to fome inevitable portion of thwarting, bickering, and unhappinefs, it lays them, in his opinion, under the neceffity of curbing their unruly palfions, and acquining habits of gentlenefs, forbearance, and peace. 'T'o this we may add, that both believing

## R I G

园tle cirildren propagated during their marriage to be theeir own (. belief unnottainable by th: father in a thate of pronifcuons conculbinase), they come by a na:ural proceis of the humm pations (fee Passion) to love each other through the medium of their nffepring. 1 F it it it b a the duty of man to acquite a fpirit firit prie, thicn peaceable, gente, and cafy to be intreatel, it nut? be agreable to the wi'l of God, and a branch of the fith is of thinge, that the fexull urinn lat du:ing the jnint lives of the puties; and therelore the exalulive right of murage, thoursh adventitious, mult be equal'y facred with thefe when are natural.

Fut 10 redra from this digrellion, into whin the ing nathral or a luentitions, are likewite atomabl: or un*'i. w's. Levery mar, when he becomes the member of a civil community, alicnates a pare of his natural rights. In a flate of nature, no man lias a fuperior on earth, and each has a right to defend his life, liberty, and pro. justy, by all the means which nature has put in his power. In civil fociety, howcrer, thefe rights are all trursicred to the laws and the magiftrate, except in cales of fuch extreme urgency as leave not time for legal intergofition. This fingle confideration is fuffci.n: to Pacw, that the riglat to civil liberty is alienable; though, is the vchemence of men's zeal for it, and in the language of fome po'itical remonflances, it has ofien been prenounced to be an uaalicnable right. " The the reaton (fays Mr Paley) why mankind hold in deteftation the memory of thofe who have fold their liberty to a tyramt is, that, togcther with their own, they fold conmonly or endangered the liberty of others; of wi.ich they had certainly no right to difpofe." The rights of a prince orer his pecpie, and of a huband over his wife, are generally and naturally vnalienable.
Perfectand Another divifion of rights is into thofe which are peris jerfest. feet and thofe which are imperfect. Perfect rights are fuch as may be precifly afoetained and aferted by force, or in civil fociety by the courfe of law. 'l'o im. lericat rights neither force nor law is applicable. A man's rights to his life, porfon, and property, are all perfect; for if any of thefe be aitackod, he may repel tle atiack by inftant violence, punifh the agreffor by the conre of lasw, or enmpel the author of the injury to make reftitution cr fitislation. A woman's tight to her honour is likewic pareet; for it the cannot ullerwife cfarc, the may kill the ravilher. Every I oor man has undoubted right to relief from the rich; but his right is imperfe?, for if the relief be not voluntanily given, he cannot compel it cither by law or by viclence. There is no duty upno which the Chrifian relizi a put-a greater value thanalors giving; and overy 1 reacher of the gofpel has an urd wbted right to inculcaic the pratice of it upon his audience; but even th is right is imperfet, for lec comnot refufe the commonion to a man mercly rn account of his illiberality 1) the pror, as he can to another for the ne rled of any duty conmprlaended under the term juitice. In clecthons or appointmonts to olieces, where the qualificadicms are piefe: ibcd, the bent qualified candidate has unyucftionabiy a rieghe to fuecens; uet if he be rej.eled, E can nother leize the oflece by force, mor nbtain tei.efs at lim: His right, therecore, is imperícen.

Here a queffion maturally offers iffelf to our confiferati.n: "IIow crmes a perion to have a rijht to a lhing,
and yet have no right to ufe the means neceflary to cbtain it:" 'the anfwer is, 'lhat in fuch cafes the nbje.t or the circumflances of the risht are fo indeterminate, that the permilion of force, cren where the rifht is real and certain, would lead to force in other cafes where there exifts no sight at all. Thus, though the poor man has it right to rclief, who thatl afeettais the mode, feafos, amd quantum of it, or tlie perfon by whom it thall be adminitered? 'Thefe things muft be afiertained betire the disht to rilief cin be erifored by hw ; but to :llow them to be afcertained by the poor themfelves, would be to expofe property to endlefs claims. In like manner, the comparntive qualifications of the condidate nut be afcertainct, before he can enforce his right to the office ; but to allow him to afee:tain his qualifications himfalf, would be to make him judge in his own canfe between himfelf and his neighbour.

Wherever the right is imperfeat on orec fide, the cor-Imperfed refpending obligation an the other muft be imperfect rights elikewife. "The violation of it, however, is oficn not qually falefs criminal in a moral and religions view than of a cred with perfect obligation. It is well obferved by Mr Paley, whith ar that greater guit is incurred by diappointing a wor perfect. thy candidate of a place upon which perhaps his livelihood depends, and in which he could eminently ferve the public, than by filching a book out of a library or picking a pocket of a handkerchief. 'I'he fame tentiment has been exprefled by Mr Godwin, but in terms by mach too llrong, and fuch as thow that he wa. art at the time complete matter of his firbject. "My ncighbour (fayshe) has jult as much right to put an end to my exiftence with dagger or foiton, as to deny me that recuniary afliftance without which I molt farve, or as to deny me that affillance without which $m y$ inteliectual attanments, or my moral exertions, will be materially injurcd. He has jutt as much right to amufe himfelf with burning my loule, or torturing my children upon the rack, as to thut himfelf up in a cell, carelefs about his fillow men, and to hide 'his talent in a napkin."

It is cortainly true, that the man who fheuld fuffer another to ftarve for want of that relief whic's he limew that he alone conld afford him, would be guity of murder, and murder of the cruelleft kind ; but there is an immenfe difference between depriving fociety of one of its mombers, and with holding from that menber what might be neceffary to enable him to make the greateit polible intellectual attainments. Newton mighthate been uicful and lappy though he had never beea acquanted witl the elements of mathematics ; and the late celebrated Mr Fergullon might have becn a valuabie member of fuecty, though he had never emerged fir mo his original condition of a thepherd. "lheremainder of the paragraph is too atfurd to require a formal co: freation. Had our author, buyging lis talent ia a noplin, that himfelf up feven yeats ago in a ce:l, catele is atmet lis fellow ren and poltionl $j$ fice, le would have deprived the publie of what he doubtiefs bulcw s to be mach uis ful inftrnaton; but had he at that pasiud amulal lime
 on the rack two or three chidien, he would hase chet off, i, rany thint he could know, two or thee futi:Nowtons, ant have himfelf been cat ofli hy the infulta. laws of his country. Liun, withoat linguhare the value

Right, of ten Newions to be equal to that of one Godruin, we Rightcouf- are warranted to fay, that however great his merit may nels.

13
Rights par- Riglts, are particular or general. Particular rights ticular and are tuch as belong to certain individuals or crders of gencral. men, ard not to others. The rights of kings, of mafters, of hulbands, of wives, and, in fhort, all the rights which originate in fociety, are particular. General rights are tholelwhich belong to the fpecics collectively. Such are our rights to the vegetable produce of the earth, and to the fleth of animals for food, though about the origin of this latier right there has been much diverfity of opinion, which we have roticed in another place. (See Theology, Part I. 反eet. 2d). If the vegetable produce of the earth be included under the general rights of mankind, it is plain that he is guilty of wrong who leaves any confiderable portion of land wafte merely for his own amufement :le is leffening the common flock of provilion which Providence intended to diltribute among the fpecies. On this principle it would not be eafy to vindicate certain regulations refpeating game, as well as fome other monopolies which are proteded by the manicipal laws of molt cuntries. Mr Paley, by ju!t reafoning, las eft.blifhed this conclufion, " that nothing ought to be made exclufive property which can be conveniently enjoyed in common." An equal divifion of land, however, the dream of fome vifionary reformers, would be injurious to the general rights of mankind, as it may be demonftrated, that it would lefien the common ftock of privifions, by laying every man under the neceflity of being his own weaver, t.iilor, fhoemaker, fmith, and carpenter, as well as ploughman, miller, and baker. Among the general rights of mankind, is the right of necefity; by which a min may ufe or deftroy his neighbour's property when it is abfolutely neceffary for his own prefervation. It is on this principle that goods are thrown overboard to fave the thip, and houfes pulled down to fop the progrefs of a fire. In tuch cafes, however, at leafi in the lath, reftitution ought to be made when it is in our power; but this reltitution will not extend to the original vatlue of the property deflrojed, but only to what it was woith at the time of deftroying it, which, cunlidering its danger, might be very little.

RIGHTEOUSNESS, means juftice, honefty, virtinc, goodnets, and ansongf Chritians is of exacty the funs import with holinefs, without which, we are told, 1:0 man thall fee the Lord. The docime of the fall, and of redemption through Jefus Chritt, has occalimed match difputation, and given rife to many fingular notions in the world. The haughty philotopher, difatisfied with myfteries, and with the humiliating doctrine of atonement by a crucified Saviour, has made a rcligion for himfelf, which he calls rational Chrifianily"; a a d the enthutiath, by extracting doannes from Scipture which are not contained in it, and which are repugnant to its fpirit, has given too much countenance th) this prefumptirn. The dottrine of imputed righter ufnefs, by which the merit of Chrit is faid to be inmfuice to us, appears to be of this number; and though it inus been held by many good, and by fume learried men, it is certainly in general unfriendly to virtue as will be readily allowed by all who have converfed with the more ignorant fort of Miethodits in England or Sebe, they are not infinite, and that the addition of thole of one Newton to them would undoubtedly increafe ch one Nem.
ceders in Scotland. That it does not follow from the doarrine of the atonement, and confequently that it has no foundation in Scripture, will appear elfewhere. See Theolug\%.

Bill ef RICHTs, in law, is a declaration delivered by the lords and commons to the prince and princefs of Orange, $1^{\text {th }}$ February 1688 ; and afterwards enactel in parliament, when they became king and queen. It icts forth, that king James did, by the affiffance of divers evil comfellors, endcavour to fubvert the laws and liberties of this kingdom, by exercifing a power of di:penting with and fulpendian of laws; by levging money for the ufe of the crown by pretence of prerogat tive wihhout confent of parliament; by profecuting thiofe who petitioned the king, and difcouraging peritions; by raiting and keeping a ftanding army in time of peace; by violating the fircedom of election of members to ferve in parliament; by violent profecutions in the court of king's bench ; and cauling partial and corrupt jurors to be returned on trials, exceffive bail to be takon, exceffive fines to be impofed, and cruel punifhments inflited; all which were declared to be illegal. And the declaration coricludes in thefe remarkable words ;"And they do claim, demand, and infift upon, all and fingular the premifes, as their undonbted rights and libertics." And the a\&t of parliament itfelf (I W. \& M. Itat. 2. cap. 2.) recognizes " all and fingular the rights and liberties, afferted and claimed in the fa:d declaration, to be the true, ancient, indubitable rights of the people of this kingdom." See Liserty.

RIGIDITY, in phyfics, cenoes a brittle hardnefs. It is oppored to duatility, malleability, and foftnets.

RIGOLL, or Regals, a kind of mufical infrument, contiaing of feveral fticks bound together, only feparated by beads. It is tolerably harmonious, being well itruck with a ball at the end of a itick. Such is the aiconnt which Graffinatu gives of this infrument. Skinner, upon the anthority of an old Englifh dicaionarry, repretents it as a clavichord, or claricord; poifitly founding his opinion on the nature of the office of the tuner of the regals, who ftill fublitts in the eftablifhment of the hing's chapel at St James's, and whote bufinets is to kecp the orgatn of the chapel royal in tene ; and not knowing that fuch wind inftruments as the orgen need frequent tuning, as well as the clavichord ard other fringed infruments. Sir Henry Spelman derives the word rijoild from the Italian rigabello, a mufical i.ntrument, anciently uled in cluurches inftead of the organ. Walther, in his defcription of the regal, makes it to be a recd-work in an ongan, with metal and alfo wooden pipes and bellows adapted to it. And he adds, that the name of it is fuppoled to be owing to its haring been preiented by the inventor to fume king.From an account of the recolal ufed in Germany, and other parts of Earope, it appears in confilt of pipes and keys on one fide, and the bellows and wind-chelt on the other. We may ad, that Lord Batcon (Nat. Hift. cent. ii. §-102.) ditlinguilhes between the regal and urgan, in a manner which fhowsthem to be inftuments of the fame clafs. Upon the whole, there is reafon to cunchaje, that the regral or tigoll was a preumatic, and not a ftringed inftrument.

IVerfennus relates, that the Flemings invented an itftrumen:, lis regales dic loie, confifing of 17 cylindrical

Rizor pieces of rood, decreafing gradually in length, fo as to produce a fuccelfion of tones and femitones in the diatonic ferics, which had keys, and was played on as at finet ; the hint of which, he fies, was taken from an inftoment in ufe among the Tiuks, conlilling of 12 wooden cylinders, of different lengths, flrung logether, which being lufpended and truck with a Atrek, having a ball at the end, produced mufic. Hawkins's Hilt. Muf. rol. ii. p. +49 .

RIGOR, in medicinc, a convuifive fludgering from fevcre cold, an ague fit, or other diforcler.

RIMINI, an ancient, popu'ous, and handfome town of Ita: 1 , in Romannal, which is part of the territory of the cburch, with a bilhop's fee, an old caftle, and it Atrong lower; as alfo many remains of antiquity, and very fine buidings. It is famous for a council in 1359 , confiting of 400 bithops, who were all Arians except 2c. It is feated in a fertile plain, at the mount of the river Marecchia, on the gulph of Venice. E. Long. 12. 39. N. Lat. 44.6.

RIND, the Rin of any fruit that may be cut off or pared. Rind is alfo ufed for the inner bark of trees, or that whitifh foft fubllance which adheres immedi. ately to the wood. See Plant.

KING, an ornament of gold and filver, of a circular figure, and ufually worn on the finger.

The epifcopal ring (which makes a part of the pontifical apparatus, and is efteemed a pledge of the fpiritual marriage between the bifhop and his church) is of very ancient ftanding. The fourth council of Toledo, held in 633, appoints, that a bifhop condemned by ine council, and found afterwards innocent by a fecond, fhall be rettored, by giving him the rimg, ftaff, sic. From bifhops, the cuftom of the ring has paffed to cardinals, who are to pay a very great fum frojure annuli cardinulitii.

RINGS. The antiquity of rings is known from Scripture and profaric authors. Judah left his ring or lignet with '「amar (Gen. xxxviii. 18). When Pharaoh committed the government of all Egypt to Jofeph, he took his ring from his finger, and gave it to Tofeph. (Gen. xli. $t^{2}$ ). After the victory that the Ifraslites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the ear-rings, that they had taken from the enemy (Numb. xuxi. 50). 'The Ifraelitith women wore rings not only on their fingers, but alfo in their noftils and their cars. Sc James diltinguilhes a man of wealth and dignity by the ring of gold that he wore on his linger (Jumes ii. 2). At the return of the prodizal lon, his tather orders him to be dreffed in a new finit of clothes, and to have a ring put upon his finger (Luke xv. 22). When the Lord threatened King Jeconiah with the utmof effects of his anger, he tel's him, that though he were the lignet or ring upon his finger, yet he thould be torn off (jer. xaii. zł.)

Tho ring was ufed chichy to feal wih: and the Scriptue erenerally puts it in the hands of princes and great perfons; as the king of Egypt, Jofefh; Abaz, Jeacbel, King Ahalucrus, lis favousite Haman, Mordecai, who fucceeded Haman in his dignity, King D.rius (1 Kings xxi.8. ; Etheriii. 10, \&c.; I)an. vi. 17). The patents and orders of thele princes were fealed with their rings or fignets; and it was this that fecured to than their authority and repeet. Sie the article Seal.

Risc-Bor:. See Farriery, Sect. rxxi.
Riwg-Oujel, in ornithology, a fpecies of Tuzdüs.
RIO-grande, a river of Africa, which runs from eaft to weft through Negroland, and falls into the Atlamtic occan, in 11 degrees of latitude. Some tatic it to be a branch of the Niger, of which there is not the leait proof.

Rro-Graule, a river of South Americ , in Brafil, which has its fource in an unknown country: it croffes the captainhip of Rio-Grande, and falls into the fe:t at Natal los Reyis.

Roo. Faneiro, a river of South America, which rites in the mountains weft of Bratil, and runuing eak tirough that country, falls into the Atlantic Ocean, in S. Lat. 23. 30. The province of Janeiro is ore of the ricliet in Brutii ; and produces gild, filver, dimonds, and other precions flones.

RIOM, it town of Frunce, in Auvergne; feated on a hill, in fo agrecable a country, that it is called the garden of Auvergne. E. Long. 3. 12. N. Lat. 45. 51.

RTOT, in law. The riotous allembling of 12 per. fons, or more, and not difperling upon proclamatiou, was firl made hightreaton by ftatute $3 \dot{3}+\mathrm{Edw}$. VI. c. 5 . When the king was a minor, and a change of religion to be cffected: but that fatnte was repealed by ftatute 1 Mar. c. 1. amoner the other treafons created fince the 25 Edw. III.; though the prohibition was in fubtance re-enacted, with an inferior degree of punifhmient, by fatute 1 Mir. R. 2. c. 12. which made the fame offence a fingle felony. Theie ftatutes ipecified and particularized the nature of the riots they were meant to lupprefs; as, for example, fuch as were let o:t foot with intention to offer violence to the privy-comncil, or to change the laws of the kingdom, or fot certain other fpecific jurpofes; in which cafes, if the perfons were commanded by proclamation to difperle, and they did not, it was by the fatute of Mary made felony, but within the benefit of clergy; and alio the ast indemnified the peace-officers and their affiftants, if they killed any of the mob in endeavouring to fupprefs fuch riot. This was thought a neceffary fecurity in that fanguinary reign, when popery was intended to be reeellablifhed, which was like to produce great difcontents: but at firt it was made only for a year, and was afterwards continued for that queen's life. And, by Itatute I Eliz. c. 16. when at reformation in religion was to be once more attempted, it was revived and continued during her life alfo; and then expited. From the acceflion of James I. to the death of Oueen Anne, it was never once thought expredient to revive it; but, in the firtt year of George I. it was judged necelfary, in order to lupport the exectition of the act of fetlement, to renew it, and at one froke to make it perpetual, with large additions. For whereas the former aets exprefisly defined and fecified what thould be accounted a riot, the ftatute 1 Geo. I. c. 5 . enasts, gencrally, that if any 15 perions are unlitwlully affembled to the difturbance of the peace, and any one jultice of the peace, theritf, under therill, or mayor of atown, thall think proper to command them by p:oclamation to difperie, if they contemn his orders and continue together for one hour afterwards, fuc! contempt fhall be telony without leneft of clergy. And farther, if the reading of the prochmation be by force oppofed, or the reader be in any rennner wilfully hindered

Riwt,
hindered from the reading of it, fuch oppofers and hinderers are felons without benefit of clergy; and all perfons to whom fuch proclamation cught to bave been made, and knowing of fuch hindrance, and nut difperfing, are felons without benefit of clergy. There is the like indemnifying claufe, in cafe any of the mob be unfortunately killed in the ondeavour to difperfe them; being copied from the act of queen Mary. And by a fublequent claufe of the new act, if any perfen, to riotnuly affembled, begin even before proclamation to pull down any church, chapel, meeting-houfe, dwell-ing-houfe, or out-houfes, they fhall be felons without benefit of clergy.

Riots, routs, and unlawful affemblies, mult have three perions at lealt to conftitute them. An unlazujul of Jeintly is, when three, or more, do affemble themfelves together to do an unlawful ast, as to pull down inclofures, to deftroy a warren or the game therein; and part without doing it, or making any motion towards it. A rout is where three or more meet to do an unlawful act upon a common quarrel, as forcibly breaking down fences upon a right claimed of common, or of way, and make fome advances towardsit. A riol is whcre three or more astually do an unlawful at of violence, either with or without a common caufe or quarrel ; as if they beat a man; or hunt and kill game in another's park, chafe, warren, or liberty; or do any other unlawful act with force and viulence; or even do a lawful act, as removing a nuifance, in a violent and tumultuous manner. The punithment of unlawful affembling, if to the number of 12 , we have jult now feen, may be capital, according to the circumflances that attend it; but, from the number of three to eleven, is by fine and imprifonment only. The fame is the cafe in riots and routs by the common law; to which the pillory in very enormous cafes has been fometimes fuperadded. And by the ftatute 13 Hen. IV. c. 7. at:y two juftices, together with the fheriff or under-fheriff of the county, may come with the pofe comitatus, if need be, and fupprefs any fuch riot, aftembly, or rout, arreft the rioters, and record upon the fpot the nature and circumilances of the whole tranfaction; which record alone fhall be a fufficient convidion of the offenders. In the interpretation of which Ratuie it hath been holden, that all perions, noblemen and others, except women, clergymen, perfons decrepid, and infants under 15, are bound to attend the jultices in fup. picting a riot, upon pain of fine and imprifonment; and that any battery, wounding, or killing the rioters, that may happen in fuppreffing the riot, is jullifiable. So that our ancient law, previous to the modern riotaft, leems prety well to have guarded againft any violent breach of the public peace; efpecially as any riotous affembly on a public or general accoumt, as to $1 e$ drefs grievances or pull down all inclotures, and alfo refilting the king's forses if fent to keep the peace, may omount to overt atts of high treafon, by levging war againt the king.

RIPEN, a cown of Denmark, in north Jutland, and capital of a diocefe of the fame name, with a biAlop's fee, a goed harlour, a calle, two colleges, and a public library. RIPH.ITH, or Rirhit, fecond fon of Gomer,
 moft copies he is calleal Diphert, in thic Chronicles (1 Cl r. i. ( 1. rat Diqhatt.) The relemblanec of the two HItbew leters ? Refand a Duthib is so much, that they are very often confounded. But, to the credit of the tran!lators of our Englifla verlien be it Gide what in th is intionse, as well as in many others, they lase reltored the original reading, and rendered it Riphath. The learned are not agrecd about the country that was penpled by the defcen sants of Riphath. The Chuluec and Arabic take it or France ; Eufehius for the counsy of the S.auromatr ; the Chronicon Alexandrinum for that of the Garamant: ; Jofeplues for Pdpllazonia. Melataffures us, that anciently the poople or this province were called Riphatei, or Riphataces; and in B thyaia, bordering upon Paphayon:a, may be four.d the river Rhebeus, a people called Rleboutis, and a canton of the lame name. Thele reatoms have prevailed with Bochart to believe, that Riphath peopled Papllagonia. Others think he pe"pled the Montes Riphei; and this opinion feems the mot reafonable to us, becaufe the other fons of Gomer peopled the not. thern countries towards Scythia, and beyond the Euxine fea.

RISIBLE, any thing capable of exciting laughter.
Ludicrous is a general term, lignifying, as m.es appear from its derivation, what is playfome, i; ortive, or jocular. Indicruas therefi re feems the genu:, of which rifible is a ipecies, limited as above to what makes us laugh.

However caly it may be, concerning any particular oljeet, to fay whether it be rillbe or not, it feems ditficult, if at all pratticable, to eftablith any general charafer, by whelh objecis of hat kind may be diftinbuilled from others. Nor is that a fingular cafe; for, upon a review, we find the fame dificulty in moft of the articles already hamdled. There is nothing more edfy, viewing a paticular object, than to pronounce t1. at it is beautiful or ngly, grend or little: but were we to attempt feneral rates for ranging objects under d fierent cl dies acecording to thefe qualities, we fhould $b$ : much graveled. A leparate canfe increafes the difficulty of diflinguiniang ritible objects by a general Tharafter : all men are not equally affected by rilible objefts, nor the fanle roun at all tmes; for in high fpirits athing vill make him laugh outright, which will feate provode a finile in a grave noond. Rifible objeRt, however, are circumferibed within certain limits. No o!jeet i, rifble but what appears flight, little, or trivial; for we laugh at no:hin? tiat is of import ance to our own interef or to that of others. A real diItrefos raifes pio, and therefore cannot be ififle ; but a dight or imaginaty dillels, which moves not pity, is iffible. The atventure of the fulling-mills in Don Quisote, is exremely rifible; io is the feene where Sucho, in a dark nolit tumblinis into a pit, and at-
tacling himfllf to the fide by hand and foot, hangs these in terrible difmay till the morting, when he difcovers himifelf to be within a foot of the buttom. A nof remarkably long of thort, is rifible; but to want it altogether, fo for from provoking laughter, raifes hormer in the feedator. With refped to works both of nature and of art, none of them are rifible but what are out of rule ; fome remarkable delétr or excels, a very long vifage, for example, of a very fhort one. Hence nothing jult, proper, decent, beauttul, proportioned, or grand, is rifible.

Even from this light iketch it will be readily conjectured, that the emotion raticd by a rifible objeat is of a nature fo fingular, as fearce to find place while the inind is occuped with any other pation or cmotion; and the conjecture is verified by experience ; for we farce cver find that emption blended with any other. One emotion we mult except; and that is, contempt railed by certain improprieties: evisy innproper ade infires us wath fome degree of contempt for the author; and if an improper aft be at the fame time rifible to provoke langhter, of which blunders and abfurdities are noted intanecs, the two emotions of contempt and of laughter unite intimately in the mind, and produce externally what is termed al laugh of derifion or of form. Hence objects that caufe laughter may be diftinguifued into two kinds: they are cither rijible or ridiculous. A rifible object is mirthful only ; a ridiculous object is both mirthful and contemptible. The firft raifes an emotion of luughter that is altogether pleafant: the pleafant enmoticn of laughter raical by the cther, is blended with the painful cmition of contempt; and the mixed emotion is termed the emo. tion of ridicule. The pain a ridiuleus whear gives me, is retented and punithed by a laugh of ceilion. A rinb'e oljeet, on the other hand, gires me no pain: it is altogether pleafant by a certain fort of titillation, which is exprefed extemally by mirthful laughter. See Ridicule.

Rtlible objects are fo common, and to well underflond, that it is unnecelfary to cemfume paper or time upon them. 'Aake the few following examples:

Fallaff. I do remember him at Clement's inn, like a man made after fipper of a checte-paring. When he was naked, he was for all the world like a forked radith, with a heal fontallically carved upon it with a knife. Secoud Part, Menry IV. aci. 3. fc. 5.

The foregoing is of difprepration. The fulluwing examples are of flight or imaginary misfortunes.

Foiffiff. Go ferts me a quart of fack, put a toalt in't. Fave 1 lived to be comried in a balket, like a barrow (f buther's offal, and to be thrown into the Thames! Well, if I be ferved fuch ancther trick I'il have my bramstare nout and butter'd, and give them to a dorg for a new-yeat's gitt. The rogues flighed me into the river with as litile remorfe as they would have druwn'd a bitch's blinel puppies, fifteen l'th'litter ; and you may know by my lize that I have a kind of alacrity in finking; it the bottom wore as deep as hell, I thould down. Ihad been drowned, but that the thore was thelvy and thallow; a death that I abhor: for the water fiveil a man; and what :a thing fhould I have been when I had been fwilled? I fhould have beea a mountain of mammy.

Merry IVices of Ilindjor. al 3.fe. ${ }^{15}$.

## R I V

Rifible Falpaf: Nay, you fhall hear, Mater Brook, what I have fuffer'd to bring this woman to cvil for your good. Beisg thus craumed ia the balket, a coupie of Ford's knaves, his hind, were call'd furth by their mittrefs, to carry me in the name of f,ul clothes to Datchet-lane. They tonk me on their thoukders, met the jealuus knave their mifter in the door, who alh'd them once or twice what they had in their banket. I gnak'd for fear, leaft the lunatic knave would have fearcle'd it; but Fate, ordaining he thould be a cuckold, held his hand. Well, on went he for a fearch, and away went I for foul clothes. But mark the fequel, Malter Brook. I fuffer'd the pangs of three egregious deaths: firtt, an intolerable fright, to be deteted by a jealous rotten bell-weather; next, to be compared like a good bilho, in the circumference of a peck hilc to point, heal to head; and then to be ftopt in, like a ftrong diltillation, with ftinking clothes that fretted in their own greafe. Think of that, a man of my kidney; think of that, that am as fubject to heat as butter; a man of continual difolution and thaw ; it was a miracle to 'rcape fuffocation. And in the height of this bath, when I was more than half ftew'd in greafe, like a Dutch difh, to be thrown into the Thames, and conl'd giowing hot, in that furge, like a hore-floe ; think of that ; hifing hot; think of that, Mr Brook.

Merry IVives of Windjor, at 3. fc. 17.

RITE, among diviaes, denores tha particular manner of ceiebrating divine firvice in this or that cour.try. RiTORNELLO, or Repeat, in mulic the burden of a foug, or the reperiti in of the fivit or cther vanfes of a font at the end of each couplet.

RITITERHUSIUS (Conrad), a learned Germa civilia: , born at Brunfivick in 1560 . He was profelfor of civil luw at Altdurf, and publifhed a varrety of worls, particularly as a civi ian; together with an edition of Oppian in Greek and Latin : he was moseover an exsellent critic ; lis notes upon many eminent authors having been inferted in the belt editions of then. He died in 1613 .

RITUAL, a book direaing the order and manner to be obferved in performing divine fervice in a particular church, diccefe, or the like. The ancient heathens had alfo their rituals, which contained their rites and ceremonies to be obferved in building a city, cor fecrating a temple or altar, in facrificing, and deifying, in dividing the curix, tribes, centuries, and in general, in all their religious ceremonies. There are feveral paflages in Cato's books, De re Rufica, which may give us fome idea of the situals of the ancients.

RIVAL, a term applied to two or more perfons who have the fame pretenfions; and which is properly applied to a competitor in love, and figuratively to $2 r$ antagonift in any other purfuit.

$$
\mathrm{R} \quad \mathrm{I} \quad \mathrm{~V} \quad \mathrm{E} \quad \mathrm{R} \text {, }
$$

 S a current of freth water, flowing in a Bed or Channel from its fource to the fea.
The term is appropriated to a confiderable collection of waters, formed by the con:flux of two or more Brooks, which deliver into its clannel the united flreams of feveral Rivulets, which have collected the dupplies of many Rills trickling down from numberlets fiprings, and the torrents which carry off from the floping grounds the furplus of every flower.

Rivers form one of the chief features of the furface of this globe, ferving as voiders of all that is immediately redundant in our rains and fprings, and alfo as boundaries and barriers, and even as highways, and in many countries as plentiful ftorehoufes. They alo fertilife cur fuil by laying upon our warm fields the richert monld, brougint from the high mountains, where it wou'd have remain-d ufelefs for want of genial heat.

Being fuch interelling objefts of attention, every branch ..cquires a proper name, and the whole acquires a for of pertonal dentity, of which it is frequently difficult to find the principle; for the name of the great body of waters which difcharges itfelf into the fea is truced backwards to one of the lources, while all the contributing fircams are loft, although their waters furm the chiet part of the collection. And fome. times the fecder in which the name is preferved is fmallcr than others which are united to the current, and which like a rich but iznoble allinace lofe their name in that of the $m$ re illuith ious farmily. Some rivers indeed are relpestable even at their birth, coming at once in force from fome great lake. Such is the Rin de la Mata, the river Si Latrence, and the mighty Areums which iliue in all direations frem the Baicallake. But,
like the fons of Adam, they are all of equal defcent, and flould take their name from one the feeders of theefe lakes. This is indeed the cafe with a few, fuch as the Rhone, the Rhine, the Nile. Thefe, after having mixed their waters with thofe of the lake, refume their appearance and their name at its outf.t.

But in general their origin and progrefs, and even Origin and the features of their charafer, bear fome refemblance progrefs fi(as has been prettily obferved by Pliny) to the life of milarto man. The river fprings from the eath; but its orisin the life of is in heaven. Its begianings are infignificart, and its infancy is frivolous; it plays among the flowers of a meadow; it waters a garden, or turns a little mill. Gathering frength in its youth, it becomes wild and impetuous. Inpatient of the reftraints which it atill meets with in the hollows among the mountains, it is reflefs and fretrul ; quick in its turnings, and unlleady in its courie. Now it is a roaring cataract, tearing up and overturning whatever oppofes its progref, and it fhoots headlong lown from a rock; then it becomes a fullen and gloomy pool, buried in the bottom of 2 glin. Kecovering breath by repofe, it again dathes al ng, till tired of the uproar and mifchief, $i$ quits all that it has fwept along, and leaves the onening of the valley ftrewed with the rejected wafte. Now, quitting its retirement, it comes abroad into the world, juarreying with more prudence and difcretion through cultivated fields, yielding to circumitances, and wiading round what would trouble it to overwhelm or remove. It paffes through thic populous cities and all the bufy haunts of man, tendering its fervices on every lide, and becomes the fupport and ornament of the country. Now increafed by numerous alliances, and adranced

Hinery

Tlee reli-gioustepacaler ruvis.
in is courfe of esifence, it becomes grave and llately in its mution:, luves peace and quict; and in majetic filence rills on its mighty waters, till it is laid to reit in the wath at ys.

The philon pher, the real lover of wifdom, fees much to admite in tac econemy and mectramisn of suming waters; and their are few opetations of mature which give lim nore opportunities of remationg the nice adjutment of the moit fimple means for attaining many purpofes of molt extenfive benificence. All mankind teem to have felt this. The heant of man is ever open (unlets perverted by the hatits of feltills indulgence :nd arrogant felf-conceit) to impreflions of gratitude anal love. Ite who aferibes the relig̣ou, principle (delaied, llough it be by the humbing abuies of fujerftition) to the workings of acar alone, may betray the flavifi meannefs of his own miad, but g'ves at very unfair and a falle pifture of the hearts of his neighbours. Lucretius was but half a philufopher when he penned his often-quoted apophthogn. Indeed his own invoc:tions thow how much the animal was blended with the lage.

Wre ajprehend, that whoever will read widh an honeft and candid mind, unbidifed by licentious wifhes, the accounts of the ancient luperflitions will acknowledge that the amiable cmotions of the human foul have had their thare in creating the numerons divinities whofe wouthip nlled up their kalendars. The fun and the holt of heaven have in all ages and natiuns been the objects of a fincere worfhip. Next to them, the rivers feem to have attraked the grateful acknowledgments of the inhabitants of the adjacent countries. They have everywhere been confidered as a fort of tutelar divinities; and each little diftrist, every retired valley, had its river god, who was preferred to all others with a partial fonduefs. The expotufation of Naaman the Syrian, who was offended with the prophet for cnjuining him to wath in the river Jordan, was the natural effution of this attachment. "What! (fiid he), are not Abana and Parphar, rivers of Damafeus, more excellent than all the waters of Judza? Night I not wafh in them and be clean? So he went awdy wroth."

In thofe countries particularly, where the rural labours, and the hopes of tiec thepherd and the hubandman, were not fo immedittly connethed with the approach ald receis of the fan, and depended rather on What happened in a far diftat councry by the falls of periodical rains or the melting of colleated fnows, the Nile, the Ganges, the Indus, the river of Pegu, were the fenlibie ateents of nature in procuring to the inhabitants of their fertile banks all their abundance, and they became the objeat ol grateful veneration. Their finates were lought out wih amsious care even by conqueritig prince; and when found, were univerfilly "rrihipped with the moit allectionate devotion. Theic remarkable ious, fo eminemly and fo palpably beneficent, preferve to thic day, amidtt cvery change of habit, and every increafe of civilization and improsement, the fond adsation cf the inh.bitants of thofe fruitiul countries through which they h id their farely courfe, and their waters are full held ficesed. No progrefs of artificial refinement, not all the e rinp:ion of luxurious tonfuahy, has been able to eradicate this plant of mathee growth fiom the heart of man. The fentiment is
congenial to his nature, and therefore it is univerfal; and we could almot appeal to the feelings of every reader, whether he docs not perceive it in his own treall. l'crhaps we may be miflalen in our opinion in the cafe of the cer:upted inhabitints of the populous and buij cities, who are habituted to the innd contemplation of their own individual exertions as the fources of all their hopes. Give the thoomaker but leather and at few tools, and be defies the powers of nature to difappoint him : bu: the fimpler inhabitants of the countre\%, the moft worthy and the moft relpectable part of every nation, after equal, perhaps greater exertion both of nill and of induftry, are more accultomed to refign themfelves to the great minitters of Providence, and to. look up to heaven for the "e.rrly and the hater rains," without which all their lab ours are fruidefs.
extrima per illos
Numenque excedens terris reffigia fecit.
And among the hulbandmen and the thepherd, of all nutions and ages, we finci the fame fond attachment to their fprings and rivulets.

## Fortunate fenex, bic inter flumina nota <br> Et fontes fucros frigus captubis opacum,

was the mourntul cjaculation of poor Melibxus. We hardly know a river of any note in our own country Whote fource is not looked on with fome refpect.

We repeat our affertion, that this worfhip was the offspring of affection and gratitude, and that it is giving a very unfair and falfe picture of the human mind to afcribe thefe fuperftitions to the working of fear alone. Thefe would have reprefented the river-gods as feated on ruins, brandifhing rooted-up trees, with angry looks, pouring out their iweeping torrents. But no fuch thing. The lively imagination of the Greeks felt, and expreffed with an energy unknown to all other nations, every cmotion of the human foul. They figured the Naiads as beantiful nymphs, patterns of gentlenefs and of elegance. They are reprefented as partially attached to the children of men; and their interference in human affairs is always in afts of kind alliftance and proteftion. 'They tetemb'e, in this refpect, the rural deities of the northern nations, the fairies, but withnat their captices and refentments. And, if we attend to the deferiptions and reprefentations of their RiverGons, beings armed with power, an attribute which ilavifh farn never tails to couple with eruely and vengeance, we find the fime expreffon of affegionate nult and confidence in their kind difpofitions. They are gencrally caled by the refpectable bat endearing name of father. "Da Tyberi pater," fays Virgil. MIr Bruce fays tiat the Nile at its fource is called the abay or "father." We obferve this word, or its radix, blendcd with many narrues of rivers of the eaft; and think it probable that when our tr:veller ont this nume from the inhabitants of the neighbourhood, they applied to the Atram what is meant to exprefs the tutelar or prefi. diag fpirit. The river-gods are always reprefented as venerable old men, to indicac their being eneval with the worls. But is is always a cribla oirinifque fecee?us, and they are nover reprefen:ed as oppreffed with age and decrepitude. 'I'heir beards are long and flowing, their looks placid, their attitule eafy, reclined na a bank, covered, as they are crowned, wihn never-fading fedges and bultulhes, and leaning oa their urns, from which they pou: out their plentifu! and fertilizing frame--

Mr Bruce's defription of the fources of the Nile, and of the refpect paid to the facred waters, has not a frowning feature ; and the hofpitable old man, with his fair daughter Irepone, and the gentle prielthood which peopled the little village of Gefh, forms a contraft with the neighbouring Galla (anong whom a military leader was called the lanib, becaufe he did not murder pregnant women), which very diftinaly paints the infpiring principle of this fupertition. Pliny fays (VIII. 8.) that at the fource of the Clitumnus there is an ancient temple highly refpeced. The prefenee and the power of the divinity ate expreffed by the fates which ftand in the veftibule.-Around this temple are feveral little chapels, each of which covers a facred fountain; for the Clitumnus is the father of feveral little rivers which unite their fteams with him. At fome diftance below the temple is a bridge which divides the faered waters frem thofe which are open to common ufe. No one mult prefume to fet his foot in the ftreams above this bridge; and to fep nver any of them is an indignity which renders a perion infamous. They can only be vilited in a confecrated boit. Below the bridge we are permitted to bathe, and the place is inceffantly occupied by the neighbouring villagers. (Sce alfo Vilius Sequefr. Orbeilai. p. 101-103. and 221 -223. alfo Suelon. Caligula, c. 43. Virg. Georg. II. 146.)

What is the caufe of ail this? The Clitumnus flows (near its fource) through the richelt paftures, through which it was carefully diftributed by numberlefs drains; and thefe nourifhed cattle of fuch fpotefs whitenefs and extraordinary beatut, that they were fought for with eagernefs over all Italy, as the mof aleceptable vistims in their facrifices. Is not this fupertition then an effufion of gratitude?

Such are the difates of kind-hearted nature in our brealts, before it has been vitiated by vanity and felfconceit, and we thould nor be athamed of feeling the impreffion. We hardly think of making any apology for dwelling a little on this incidental circumftance of the luperititious veneration paid to rivers. We cannot think that our readers will be difpleafed at having :tgrecable ideas excited in their minds, being always of opinion that the torch of true philifophy will not only enlighten the underftanding, but alfo warm and eherifh the afferions of the heart.

With refpect to the orizin of rivers, we have very little to olfer in this place. It is obvious to cvery perfon, that befides the torrents which carry down into the rivers what part of the rains and melted fows is not ablorbed by the foil or taken up by the plants which cover the carth, they are fed either immediately or remotely by the fprings. A few remarkable fleeams rufh sit once out of the earth in force, and muit be confidered as the continuation of fubterraneous rivers, whote origin we are therefore to feek out; and we do not know any circumfance in which their firt beginnings differ from thofe of other rivers, which are formed by the union of little fream; and rills, each of which has its own fource in a fpring or fouptain. This queftion, therefore, What is the procefs of nature, and what are the fupplies which fill cur ferings? will be treated of under the word Spring.

Whatever be the fource of rivers, it is to be met with in almon every part of the globe. The crult of
earth with which the rucky framing of this glote is covered is genemily fratificd. Some of thele ftrata are extremely pervious to water, having but fmall attraction for its particles, and being very porous. Such is the quality of gravelly Anatt: in an eminent degree. Other itrata ate much more firm, or attras water more Arongiy, and refufe it a paffage. This is the cafe with firm rock and with clay. When a firatum of the fir! kind has one of the ofher immediately under it, the water remains in the upper frotum, and burfts out wherever the floping fides of the hills cut off the ftrata, and this will be in the form of a trickling fprirg, becaufe the water in the pormus flratum is gieatly ob. flructed in its palfage nwards the outle. As this irregular formation of the earth is very general, we mult have fprings, and of courfe rivers or rivulets, in every corner where there are high grounds.
Rivers flow from the hisher to the lower grounds. It is the arrangement of this elevation which diftributes them over the furface of the earth. And this appears to be accompliilleed with confiderable regularity; and, except the great defert of Kobi on the conines of Chinefe Tartary, we do not remember any very extenfive track of ground that is deprived of thofe cbannels for voiding the fuperfluous waters; and even there they are far frons being redundant.

The courfe of rivers gives us the beft general method Coarie of for judgiag of the elevation of a couritry. Thus it the rivers appears that Savoy and Switzerland are the highef of Eurrpes grounds of Europe, from whence the ground flopes in every direction. From the Alps proceed the Danube and the Rhine, whole courfes mark the two great valleys, into which many lateral ifreams defeend. The Po alfo and the Rhone come from the fame head, and with a feeper and fhorter courfe find their way to the fea through valleys of lefs breadth and length. On the weft fide of the vallers of the Rhine and the Rhore the ground rifes pretty falt, fo that few tributary itreams come into them from that fide; and from this gentle elevation France flopes to the weitward. If a line, ne:rly traight, but bending a little to the northward, be drawn from the head of Savoy and Switzerland all the way to Solikamkloy in Siberia, it will nearly pafs through the molt elevated part of Europe; for in this track mont of the rivers have their rife. On the leit go off the various feeders of the Elbe, the Oder, the Wefel, the Niemen, the Duna, the Neva, the Dwina, the Petzora. On the right, after pulfing the feeders of the Danube, we fee the fources of the Sereth and Pruth, the Dniefter, the Bog, the Dnieper, the Don, and the mighty Volga. The elevation, however, is extromely moderate; and it appears from the levels taken with the barometer by the Abbe Chappe d'Auteroche, that the head of the Volya is not more than 470 feet above the furface of the ocean. And we may obferve here by the bye, that is mouth, where it difcharges its waters into the Cafpian fea, is madoub:edly lower, by many feet, than the furface of the occan. See Pneumatics, n ${ }^{\circ}$ 277. Spain and Fim1dnd, with Lapland, Norway, and Sweden, form two detached parts, which have little fymmetry with the relt of Eurnpe.

A chain of mountains begins in Nova Zembla, and of ious ftretches due fouth to near the Cafpian Sca, dividing Euroee front Afia. About three or four degreas north

Bisony.
of the Cafpia: foa it bends to the fouth-c.aft, traverfes welle rn' 'outary, and pafinghenween el.e 'Tengis and Z.n. zan lukes, it then brameles to the catk and fiuth. Tiee e Rfern branci, puas to the fhres of Kinca and Kamefintka. The foulbern b unch traveries Turkeft.an and Thitor, fepatating thim $\mathrm{f} . \mathrm{m}$ India, and at the heat of the king in off sta juins an anm tretching from the great: calern bramh, and leve fornis the centre o: a ve. $y$ fingular matiatim. Chains ot mountans iflue fr $m$ it in ever! direxion. The ar four of them keep vely chfe together, divising the ecminent int harrow fips, which have each a great river flowine in the nidude, and reaching th the extreme points of M.lacea, Cambodi., and Coclin-chiaa. In m the fame central point procceds another great riuge due call, and palfes a little noth oa Canturn in China. We called this a ingular centre: for though it fends cill fo many branches, it is by 1.0 means the mof elevated part of the continent. In the triangle which is incluwed be ween the firit i.u. thern ridee (which comes from between the lakes Tenges and Zaizant, the great eatton ridye, and its branch which almon unites wi h the fouthern ridge, lies the loouan, and part of Thibet, and the many little rivers which occupy its furface, How fouthward and caltward, rmiting a little to the north of the cemtre olten mentimed, and then pafs through a gorge ealtward in:o China. And it is farther to be obferved, that thefe great ridges do not appear to be feated on the higheft parts of the country ; fer the rivers which cotretpord to them are at no great ditance from them, and receive their chief flepplies from the other fides. This is remarkably the cafe with the great Oby, which runs aln:oft parallel to the ridge from the lakes to Nuva ZemWa. It receives its fupplies from the calt, and indeed it has its fource far calt. The higheft grounds (if we except the ridges of mountains which are boundaries) of the continent feem to be in the country of the Calmucs, about $95^{\circ}$ eafl from London, and laitude $43^{\circ}$ or $45^{\circ}$ north. It is reprefented as a fine though fandy country, having many little rivers which tofe themfelves in the fand, or end in little folt lakes. This elevation ftretches northeaft to a great difance; and in this track we find the heads of the Irtifh, Selenga, and Tungufkaia (the great feeders of the Oby), the Olenita, the Lena, the Yana, and fome other rivers which all go off to the north. On the other lide we have the great river Anaur, and many fmaller tivers, whofe names are net familiar. The Hoangho, the great tiver of China, riles on the fouth fide of the great caftern ridge we have jo ofren mentioned. This elevation, which is a contination of the former, is fomewhat of the fame comphexion, being very fandy, and at prefent is a delert of prodigious extent. It is defcribed, however, as interfperfed with valt tracks of wich patture; and we know that it was formorly the relidence of a great nation, who cama fouth by the neme of Turlis, and porleclical themfelves of moft of the riclielt kingdrms of Afia. In the feuth-weltern exeremity of this countiy are found remains not only of barbaric magnificence, but even of cultivation and elegarce. It was at profitable priviletre granted by Peter the Gre.t to fome adveuturers to iearch thefe fandy deferts for remains of former opulence, and many pieces of delicate workmandhip (tho' tiot in a fyle which we would admire) in gold and fil-
rer were found. Vaits were found buried in the fand Hifinte. filled with writen papers, in a charakter whe lly unhrown; and a wall wis difcovered extending ferecal nile, buile with hem fone and ornamented with corniches and battiements. But we are forgetting curfelves, and return to the comfideration of the dillribution of the riters on the fulface of the earth. A geat ridge of mountains begins at the fouth-eatt corne of the Euxine Se.a, and proceeds c.lftward, ranging along the fouth fide of the C.rfpan, and fill advancing unites with the mounsains fint mentioned in ?h bet, fending off fome branches w the fouth, which divide Persal India, and Thibet. From the fouth fide of this ridge low the Euphrates, Tigris, Indus, Ganges, \&c and from the north the ancient Oxns ard many unsiown fireams.

There is a remark able circumiltance in this quarter of the globe. Although it feems to be neareft to the greatelt elevations, it feems alfo to have places of the greateft depreflion. We latve dready fuid that the Catpian Sea is lower than the ocean. There is in its neighb urhood another great bafon of falt water, the lake firal, which receives the waters of the Oxus or Gihon, which were daid to have formerly run into the Cafpian Sea. There cannot therefore be a great difference in the level of thefe two bifons; neither have they any outlet, tho' they receive great rivers. There is another great lake in the very middle of Perfia. the Zare or Zara, which receives the river Hindemend, of near 250 miles length, befides other Areams. There is ano her fuch in Alia Minor. The fea of Sodom and Gomorral: is another inftance. And in the high countries we mentioned, there are many finall folt lakes, which receive little rivers, and have no cullet. The lake Zara in Perfit, how ever, is the only one which indicates a con(iderable hollow of the countr. It is now afcertained by aftual furvey, that the fea of Sodom is confiderably higher than the Mediterranean. This feature is not, however, peculiar to Afia. It obtaius alfo in Africa, whofe tivers we now preceed to mention.

Of them, however, we know very little. The Nile of ${ }^{11}$ indced is perhaps better known than any river out of Europe; and of its fource and progrefs we have given a full account in a feparate article. See Nile.

By the regilter of the weather kept by Mr Bruce at G ndar in 1770 ard 1771 , it appears that the greateft rains are about the begming of July. He f.yys that at an averaye each minth ater June it doubles its rains. The calith or canal is openes at Cairo about the gth of Augnf, when the river has rifen 14 peeks (each 21 inches), and the waters begin to decreafe about the roth of Sutember. Hence we may furm a conjecture encerning the time which the wate: employs in coming fion Abyilinia. Ar Bruce fuppofes it 9 days, which fup? poles a velucity not hefs than it fect in a fecond; a thing patt belief, and inconfiftent with all our notions. The beneral llope of the river is greatly diminithed ly feveral gacat cathats ; and Mr líruce exprelsly fays, that he might have cone down from Sennaar to the cataracts of Syene in a bout, and that it is navigable for boats far above Scmam. He came from Syene to Cairo by water. We ajprehend that no boat would venture down a freammoving even fix feet in a fecond, and none could row up if the velocity was three fect. As the waters begin to decreafe about the roth of sur.

Biifory. September, we muf conclude that the water then flowing paft Cairo had left Albyffinia when the rains had greatly abated. Judging in this way, we muft ftill allow the ftream a velocity of more than fix fees. Had the firft fwell at Cairo been noticed in 1770 or 1771, we might have gueffed better. The ycar that Thevenot was in Egypt, the firft fwell of 8 peeks was obferved Jan. 28. The califh was opened for 14 peeks on Augult ith, and the waters began to decreafe on September 23 d , having rifen to $21 \frac{2}{3}$ peeks. We may luppole a fimilar progrefs at Cairo correfponding to Mr Bruce's obfervations at Gondar, and date cvery thing five days earlier.

We underftand that fome of our gentiomen ftationed far up the Ganges have had the curiofity to take notes of the fwellings of that river, and compare them with the overfinwings at Calcuita, and that their obfervations are about to be made public. Such accounts are valuable additions to our pratical knowledge, and we fhall not neglect to infert the information in fome kindred article of this work.
The fame mountains which attrast the tropical vapours, and produce the fertilizing inundations of the Nile, perform the fame office to the famnus Niger, whofe exiftence has often been accounted fabulous, and with whofe courfe we have very little acquaintance. The refearches of the gentlemen of the African alfociation render its exitence no lugger doubtful, and have greaily excited the public curiolity. For a farther account of its track, fee Niger.

From the great number, and the very moderate fize, of the rivers which fall into the Atlantic Ocean all the way fouth of the Gambia, we conclude that the weftern fhore is the moitelevated, and that the mountains are at no great diftance inland. On the other hand, the rivers at Melinda and Sofila are of a magnitude which in. dicate a much longer courfe. But of all this we fpeak

The frame-work (fo to call it) of America is better known, and is fingular.

A chain of mnu tains begins, or at leaft is found, in longitude $110^{\circ}$ weit of London, and latitude $40^{\circ}$ north, on the $n$ rthern confiues of the kingdom of Mexico, and ftetching fouthward through that kingdom, forms the ridge of the neck of land which feparates North from South America, and keeping almoit clufe to the fhore, ranges aling the whole weftern ccatt of South America, terminating at Cape Horn. In its courfe it fends off branches, which after feparating from i: for a few leagues, rejoin it again, inclofing vaileys of gieat extent from north to finth, and if prodigious elevation. In one of thefe, under the equat, rial fins, fands the city of Quito, in the midat of ext.nfive fielis of barley, oats, wheat, and gardens, con:aining apples, pears, and goofeberries, and in fhort all the grains and fruits of the cooler parts of Europe; and although the vine is al:o there in perfection, the olive is wanting. Not a dozen miles from it in the low countries, the fingar-cane, the indigo, and all the fruits of the torrid zone, find their conzenial heat, and the ialabitanis fwelter under a hurning fun. At as fmall a diftance on the other hand tower aloft the pinacles of Pichincha, Corambourou, and Chemb racaî, crowned with never meling frows.

The individual mountains of this fupendous range not only cxceed in beight all others in the werld (if
we except the peal: of Teneriffe, Mount FEtna, and Mount Blanc) ; but they are fet down on a bafe ineornparably more elevated than any other country. They cut off therefore all communication between the Pacific Ocean and the inland continent; and no rivers are tis be found on the weft coaft of South America which have any confiderable length of courfe or body of water. The country is drained, like Africa, in the oppofite direc. tion. Not 100 miles from the city of L'ma, the cap:tal of Peru, which lies almolt on the fea fhore, and juit at the foot of the high Coidilleras, ariles out of a fmall latse the Maragnon or Amazon's river, which, after runnias northward for about ton miles, takes an eatterly direction, and croffes nearly the broideft part of South America, and falls into the great weftern ocean at Para, after a courfe of not lefs than 3500 miles. In the firit hallf of its defient it receives a ficw middle-fized rivers from the north, and from the fouth it receives the great river Combos, ipringing from another little lake not 50 miles diftant from the head of the Maragnon, and incto. fing between them a wide extent of country. Then it receives the Yuta, the Yuerva, the Cuchivara, and Parana Mire, each of which is equal to the Rhine; and then the Madeira, which has Howed above 1300 mile. At their junct on the breadth is fo great, that neither there cati be feen by a perfon flanding up in a canoe; fo that the united ftrearn mult be about 6 miles broad. In this majeftic form it rolls along at a prodigious rate through a flat country, covered with impenetrable fo. refts, and moft of it as yct untrodden by liuman feet. Mr Condamine, who came down the fream, fa;s, that all is filent as the defert, and the wild beants and numberlefs birds crowd round the boat, eyeing it as fome animal of which they did not feem afraid. The bed was cut deep through an equal and yielding foil, which feemed rich in every part, if he could judge by the vegetation, which was rank in the extreme. What an addition this to the poffible population of this globe! A narrow flip alonz each bank of this mighty river would equal in furface the whole of Europe, a a d would probably exceed it in general fertility : and although the velocity in the main ftream was great, lee oblerve.t that it was extremely moderate, nay almolt fill, at the fides; fo that in thofe parts where the coantry was inhabited by men, the Indians paddled up the river with perfect eafe. Boats could go from Pura to near the Mouth of the Madeira in 38 dalys, which is neas 1200 mices.

MrCondamine made an obfervation during his paflage down the Maragnon, which is extremely curious and infructive, although it puzzle.t him very much. He obferved that the tide was fenfible at a va!! dillance from the mouth: It was very confiderable at the junction of the Madeira ; and he fuppoles that it might have been oblerved much farther up. This appeared to him very furpriing, becaule there could be $n$, dubt but that the furface of the water there was higher by a great many feet then the furfice of the flood of the Atlantic ocean at the mouth of the river. It was therefore very natural for him to afribe th:c tide in the $\mathrm{M}_{2}$. ragnon to the immediate action of the moon on its wiaters; and this explanation was the more reafonable, becaufe the river extends in the drcnion of terreltial longitude, which by the Newioni in theory is moit favourable to the prodution of a tid:. Journeying as he

Hilery. - - "
did in an Tndiun canoe, we canot fuppofe that he had much isifue or convenicrey fir calculations, and therefore are nut turprited that he did not fee that even this - incumitance was of hit le arait in fo frall or thatlow a body of water. He earetaly noted, however, the times ot higitad inw water as he pated along. When arrived at Para, he fiund not only thit the high water "as later and later as we are farther finn. the mouth, bu: he found that at one and the fame inthent there vere feveral points of high water between lara and the conflunce of the Madeira, whth points of low water intervening. This o nelufion was ealily drawn from his wwn obliovatiens, alriough he could not fee at one inItate the hi.h waters in different places. He had only in comprite the time of high water at a particular fpot, on the day he nferved it at another; allowing, as ationl, ior the moon's change of polition. 'The refult of his ubfervations therelore was, that the finface of the fiver was not an inclined plave whofe flope was leffened by the tide of flond at the month of the river, but that it was a waving linc, and that the propagation of the tide up the river was nothing different from the pro. pagation of atay other wave. We may conceive it (learly, though imperfealy, in this way. Les ule place be noted where the tide happens 12 hours later than at the nonth of the tiver. It is evident that there is allo a tide at the very mouth at the tame inftant, and, fince the ecean tide had withdrawn itfe.f during the time that the former tide had proceeted fo far up the river, atm the tide of ebb is luceeflively felt above as well as the tide of flood, there mult be a low water between theie two high wa:cr:

Newtoa had pointed out this curious far, and obferved that the tide at London. Bridge, which is 43 feet above the fea, is rot the fame with that at Graveiend, but the preceding tide (Sce Phil. Tranf. 67.) Tllis will be more particularly infifted on in another place.

Not far from the head of the Maragnon, the Cordillera, fend off a brainch to the mortheeaft, which reaches and ranecs along the thate of the Mexican Gulf, and the Rio Grande de Etia Martha oceupics the angle betwren the ridges.

A:other ridge ranges with interruptions along the caft coatt of Terra Firma, to that the whole waters of this cumbry are collequd into the Oromoko. In like manner the north and e.ft of Brafil are hemmed in by mountinous ridges, through which there is nu confiderable poltage; and the ground floping backwards, all the "aters of this immenfe track are colleged from bwh lides by muy confderable rivers into the great siver Purdquay, or Rin de la Plata, which runs down the middle of this country fur more than 1400 miles, and falls into the fer through a vat mouth in latitude $35^{\circ}$.

Thus the whole of South America feens as if it had beco formoly fimounded by a mound, and been a great form. The groma in the middle, where the larama, Whe Madetr, and the llata, take their rife, is an imbmeni: marfa, unimabiable: for its exhatations, and gquite imperions in its prefent thate.

The manner in which the enntinent ef North Ame. rica is watered, or ruther drained, has afiof fome peculiaroies. By looking at the map, one will, bferve firlt of all a gencral divifion of the whole of the le.l hoown
part iato two, by the valleys in wheh the beds of the siver sit Latuence and Minlifppi ate fituated. The head af this is occupied by a lingular fories of frelh water deas or lakes, viz. lhe lake Superior and Machigan, which empty themfiles mono lake luron by two catarats. 'This afoun runs into lake Eifie by the river Duroit, and the Enc pours its waters into the Ontario by the famous fill of Niagara, and from the Ontasio proceds the great river Sit Laurence.

The ground io the fouth well of the lakes Superior and Eise is fomewlar lower, and the middle of the valley is occupied by the Mmiflippi and the Millouri, which reccives on boila lides in nu: ber of im.ller freams, and having joined, procecd to the fonth, under the name Mithelipyi. In latitude 37, this river reccives into its bed the Ohio, arver of equal magrimude, and the Che. rokee riven, which drains atl the country lying at the back of the United States, feparated Irom them by the ranges of the Apalachian mountains. 'The Miffillipi is now oae of the clact rivers on the globe, and proceeds due fouth, till it ialls into the Mexican b.ay through feveral thisting mouths, which greatly reiemble thofe of the Danube and the Nile, having run above 1200 miles.

The clevated country between this bed of the Miffillippi and St Laurence and the Atlantic ocean is drained on the eatt fide by a great number of rivers, fome of whichare very conliderable, and of long courfe; becaufe inftead of being nearly at right angles to the coalt, as in other countries, they are in a great meafure parallel to it. This is more remarkably the cafe with Hudfon's river, the Delaware, 1'atomack, Rapahanoc, scc. Indeed the whole of North America feems to contift of ribs or beams laid ne:rrly parallel to eacin other from north to fouth, and the rivers occupy the intertlices. All thof which empty themfelves into the bay of Mexico are parallel and almoft perfecty ftraight, unlike what are feen in orher parts of the world. The weftermoft of them all, the Norih River, as it is named by the Spaniards, as neasly as long is the Mifiaifippi.

We are very little informed as yet of the dittribution of rivers on the north-weft coaft of America, or the courfe of thofe which run into Hudfon's ard Baf. fin's bay.

The Maragnon is undoultedly the greateft river in of the ${ }^{13}$ the world, both as to length of run adid the valt body grearriof water which it rolls along. The other great rivers rivere. fuceeed nearly in the following order.

| Maragnoll, | Amur, |
| :--- | :--- |
| Sencgal, | Oroonoko, |
| Nile, | Ganges, |
| St Latrence, | Euphrates, |
| Hoangho, | Danube, |
| Rio de la Plata, | Don, |
| Yenifiy, | Indus, |
| Millifippi, | Dnieper, |
| Volga, | -Duina, |
| Oby, | \&c. |

We have been much allithed in this account of the courfe if rivers, and their diftribution over the globe, by a beautitul planiphere or map of the world publihed by Mir lode altonomer royal at B. rlin. The ranges of mountains are there laid down with ! hilof phical difcorrment and erecifion; and we tocomemend it to the notice

## Theary.

 notice of our geographers. We cannot divine what has caufed Mr Buffon to fay that the courfe of mott rivers is from eaft to weft or from weft to ealt. No phyfical point of his fyftem feems to require it, and it needs only that we look at his own map to fee its falfity. We fhould naturally expeet to find the general courfe of rivers nearly perpendicular to the line of fea-coaft; andwe find it fo; and the chief exeeptions are in oppofition to Mr Buffon's affertion. The fructure of Ame. rica is fo particular, that oery forv of its rivers have their general courfe in this ditection. We proceed now to confider the motion of rivers; a fubject which naturally refolves itfelf into two parts, theoretical and practical.

## Part I. THEORY of the MOTION of RIVERS and CANALS.

14
importance of the doctrine of the mution of rivers and canals.

THE importance of this fubject needs no commentary. Every nation, every country, every city, is interefted in it. Neither our wants, our comforts, nor our pleafures, can difpenfe with an ignorance of it. We mult conduct their waters to the centre of our dwellings; we muft fecure ourfelves againft their ravages; we muft employ them to drive thofe machines which, by compenfating for our perfonal weaknefs, make a few able to perform the work of thoufands; we employ them to water and fertilize our fields, to decorate our manfions, to cleanfe and embellifh our cities, to preferve or extend our demefnes, to tranfport from county to county every thing which neceffity, convenience, or luxury, has rendered precicus to man: for thefe purpofes we mult confine and govern the mighty rivers, we muft preferve or change the beds of the fmaller fireanis, draw off from them what fhall water our fields, drive our machines, or fupply our houfes. We muft keep up their waters for the purpofes of navigation, or fupply their places hy canals; we muft drain our fens, and defend them when drained; we mult underftand their motions, and their mude of fecret, flow, but unceafing astion, that our bridges, our wharfs, our dikes, may not become heaps of ruins. Ignorant how to proceed in thefe daily recurring cafes, how often do we fee projects of high expectation and heavy expence fail of their ubject, leaving the fate burdened with works not only ufelefs but frequently hurtful?
this has long been a molt interefting fubjeet of fudy in Italy, where the fertility of their fields is not more indebted to their rich foil and happy climate, than to their numerous derivations from the rivers which traverfe them : and in Holland and Flanders, where their very exiftence requires unceafing attention to the waters, which are every moment ready to fwallow up the inhabitants; and where the inhabitants, having once fubdued this formidable enemy, have made thole very wa. ters their indefatigable drudges, tranfporting through every corner of the country the materials of the moft extenfive commerce on the face of this globe.

Such having been our inceffant occupations with moving waters, we fhould expect that while the operative artits are continually furnilhing facts and experiments, the men of feculative and icientific curiofity, excited by the imputance of the fubject, would ere now have made couliderable progrefs in the fcience; and that the profelional engineer would be daily acting from eitablithed principle, and be feldom difappointed in his cxpectations. Unfortunately the reverse of this is nearly the tuve fate of the cafe; each enginecr is obliged to colleet the greateit part of his knowledge from his own expcrience, and by many deat-boustht leflons, to diredt his fiture operations, in which he thll proceeds V'ol. XVI.
with anxiety and hefitation: for we have not yet acquired principles of theory, and experiments have not yet been collected and publifhed, by which an empirical practice might be fafely formed. Many experiments of ineftimable value are daily made; but they remain with their authors, who feldom have either leifure, ability, or generofity, to add them to the public fock.
The motion of waters has been really fo little invef. tigated as yet, that hydraulics may fill be called a new fudy. We have merely fkimmed over a few common notions concerning the motions of water; and the mathematicians of the firl order feem to have contented themfelves with fuch viows as allowed them to entertain themfelves with elegant applications of calculus. This, however, has not becn their fault. They raiely had any opportunity of doing more, for want of a knowledge of fatts. They have made excellent ufe of the few which have been given them; but it required much labour, great variety of opportunity, and great expence, to learn the multiplicity of things which are combined even in the fimpleft cafes of water in motion. Thefe are feldom the lot of the mathematician; and he is without blame when he enjoys the pleafures within his reach, and cultivates the fcience of geometry in its moft abltratted form. Hare he makes a progrefs which is the boaft of human reafon, being almoft infured from error by the intellectual fimplicity of his fubject. But when we turn our attention to material objects, and without knowing either the fize and fhape of the elementary particles, or the laws which nature has prefcribed for their action, preiume to forcfee their effeat, calculate their exertions, dired their actions, what muft be the confequence? Nature hows her independence with refpert to our notions, and, always faithful to the laws which are eojoined, and of which we are ignorant, fhe never fails to thwart our views, to dificoncert our projects, and render ufeleŕs all our efforts.
To wilh to know the nature of the elements is vain, Proper and our grofs organs are infufficient for the itudy To mode of infuppofe what we do not know, and to fancy fhapes and veltigation. fizes at will; this is to raife phantoms, and will produce a fyltem, but will not prove a foundation, for any fcience. But to interrogate Nature herfelf, Audy the laws which fhe fo faithfully obferves, catch her, as we fiy, in the fact, and thus wrelt from lier the fecret; this is the only way to become her malter, and it is the only procedure confiftent with good fenfe. And wa fee, that foon after Kepler detected the laws of the planztary motions, when Galileo difeovered the uniform acceleration of gravity, when P.och.l difonered the preffure of the atmo.phere, and Newton difcovered the laws of attriction and the track of a ray of light; attronomy, mechanics, hydruttatics, chemittry, optics, f̨uickly bekik

came bolities of found coatrine; and the deduftions fom thai: :-fpexive theorics were fourd fatr repretentatior; ef the phenomena of nuturc. Whenever a man lais difoucred a haw of tature, he has latd the founda. thon of a fcience, and he has given us a new man of filjesting to our forvice fome elemant hieherto indcperdent: and fo long as groups of natural operations 1: llow a runte whilh appeats th us whimical, and with 1.0t a amm our calculations, we may be aflured that we are ignonant of the principle which connets them all, and regulates their procedure.
'this is remarkaly \({ }^{2}\) the cafe with feveral phenomena in the metions of fluids, and particularly in the motion of water in a bee. or conduit of any kind. Although the firlt geniufes of Europe have for this century palt turned much of their attention to this fubjes, we are aimot ignoramt of the sereral lazus which may be oblerved in their motions. We have been able to feleat very few points of refemblance, and every cafe remains nearly an individual. Abnut 150 years ago we diccovered, by experience only, the quantity and velocity of water iffining from a fmall orifice, and, after much labour, have extended this to any orifice; and this is al. moft the whole of our confidential knowledge. But as to the uniform courfe of the ftreams which water the face of the earth, and the maxims which will certainly regulate this arreeably to our wifhes, we are in a manner tetally ignorant. Who can pretend to fay what is the velocity of a river of which you tell him the breadth, the depth, and the declivity? Who can fay what fiwell 2: ill be produced in different parts of its courfe, if a dam or weiz of given dimenfions be made in it, or a bridge be thown acrofs it? or how much its waters will be raied by turning another ftream into it, or funk by taking of a branch to drive a mill? Who can fay with -onfidence what muf be the dimenfions or flope of this \(1-2 a=h\), in order to furnifh the water that is wanted, or the dimenfions and flope of a canal which thall effectuaily drsin a fenny dilitit? Who can fay what form will caufe or will prevent the undermining of banks, the forming of elbows, the pooling of the bed, or the deponfition of fands? Y'ct thefe are the noof important queftions.

The caufes of this ignorance are the want or uncertainty of our principles; the falfity of our only theory, which is belied by experience; and the fnall number of proper olfervations ur experiments, and difficulty of making fuch as thall be ferviceable. We have, it is true, made a few experiments on the efflux of water from finall orifices, and from them we have deduced a fort of theory, dependant on the fall of heavy bodies and the laws of hydroftatic peafure. Hydroftatics is indeed founded on very fimple principles, which give a very sond accoint of the law's of the quiefeent equilibriunt if fluids, in confequence of gravity and perfest fluidity. Dut by what train of teafoning can we conned thefe with the phenomena of the uniform motion of the witicrs of a ijver or open tlream, which can derive its motion orly from the flope of its furface, and the moditications of this motion or its velocity only frum the width and depti of the fream? Thefe are the only circumfances which can difinguith a portinn of a river trom a vefiel of the frome fize and fhape, in whikh, however, the water is at ref. In both, gravity is the fole cufe of proficte and mation; but t'cre nuen be fome
circumflance peculiar to running raters which modifics the exertior:s of this adive pritciple, and which, wher difoovered, mult be the batis of hydraulies, and muth oblige us to reject every theary frunded on fancidd lypritheses, and which can only liad to abfurd concluhons: and fiurely abfird confeçuences, when legitimately drawn, are complete evidenee of improper principles.

When it was ditcoveled experimentally, that the ve- principle locities of water illuing from orifices at various depths on whach under the furfuce wore as the fiquare roots of thofe the fyRems depths, and the faft was verified by repeated experiments, this principle was immediately and without modification applied to every motion of water. Mariotte, Tariguon, Guglielmini, made it the batis of complcte fyftems of hydraulics, which prevail to this day, after having received various amendments and modifications. The fame seaf ning obtains through them all, though frequently obfcured by other circuintances, whel are more perlpicunufy exprefed by Guglielnini in his Fundamental Theorems.

He confiders every point \(P\) (fig. I.) in a mafs of ccceaxsix. fluid as an orifice in the fide of a velfel, and conceives the particle as having a tendency to move with the feme velocity with which it would illine from the orifice. Therefore, if a vertical line ADC be drawn thrn' that point, and if this be made the axis of a parabolic ADE, of which A the furlace of the fluid is the vertex, and AB (four times the height through which a heavy body would fall in a fecond) is the parameter, the velocity of this particle wiil be reprefented by the ordinate PD of this para ola ; that is, 111 is the fpace which it would unitormly defcribe in a fecond.

From this principle is derived the following theory of runsing waters.

Let DC (thg. 2.) be the horizontal bottom of a re- it. fervoir, to which is joined a floping chamel CK of uniform breadth, and let \(A B\) be the furface of the ftanding water in the refervoir. Suppofe the vertical plane BC pierced with an infinity of holes, through each of which the water iffues. The velocity of each filament will be that which is acquired by falling from the furface AB . The filament C , iffuing with this re-
locity, will then glide down the inclined plane like any other heavy body; and (by the common dectrine of the motion down an inclined plare) when it has arrived at F , it will have the fime velocity which it would have acquired by falling through the height OF, the point \(O\) being in the horisonsal plane \(A B\) produced. The fame may be faid of its velocity when it arrives at H or K . The fiament immediately above C will alfo iflue with a velocity which is in the fubduplicate ratio of its depth, and will then glide down above the firlt flament. The fame may be affirmod of all the filaments; and of the fuperficial fianacnt, which will occupy the furface of the defcending liream.

Fons this account of the genefis of a running fream of The confowater, we may fairly draw the following coniequences. quenees
1. The velocity of any particle \(R\), in any part of the fream, is that acquirtu by falling fiom the horizon. t.al plane AN.
2. The velocity at the bottom of the fteam is everywhere greater than anywhere above it, and is leaf of all at the findace.
3. The velucity of the fream increafes continually as the fitean recedes from its fource.
\(\dagger\) See Guglielmini's Hydrau-
\(\qquad\)
-
\(\square\) (
4. The depths EF, GH, \&.c. in different farts of the fream, will be nearly in the inverfe fubduplicate ratio of the depths noder the furface \(A N\) : for lince the fame quantity of water is running through every festion EF and GH, and the channel is fuppofed of uniform breadth, the depth of each fection mult be in. verfely as the velocity of the water paffing through i . ' This velocity is indeed different in different filaments of the fection; but the mean velocity in each fection is in the fubduplicate ratio of the depth of the filament under the furface AB. Therefore the Atrean becomes nore flallow as it recedes from the fource ; and in confequence of this the difference between LH and MG continually diminifhes, and the velocities at the Kottom and furface of the ftream continually approach to equality, and at a great diftance from the fource they differ infenfibly.
5. If the breadth of the fream be contracted in any part, the depth of the running water will be increafed in that part, becaufe the fame quantity mult fill pafs through; but the velocity at the bottom will remain the fame, and that at the furface will be lefs than it was before; and the area of the fection will be increafed on the whole.
6. Should a fluice be put acrofs the fream, dipping a little into the water, the water mutt immediately rife on the upper fide of the flaice till it rifes above the level of the refervoir, and the fmallef immerfion of the fluice will producs this effect. For by lowering the fluice, the area of the fection is diminifhed, and the velocity cannot be increafed till the water heap up to a greater height than the furface of the referveir, and this acquires a preffure which will produce a greater velocity of efflux through the orifice left below the fluice.
7. An additional quantity of water coming into this channel will increafe the depth of the Areans, and the quantity of water which it conveys; but it will not increafe the velocity of the bottom flaments, unlefs it comes from a higher fource.

All thefe confequences are contrary to experience, and thow the imperfection, at lealt, of the explanation.

The third confequence is of all the mofe contrary to experience. If any one will but take the trouble of following a fingle brook from its fource to the fea, he will find it moft rapid in its beginnings among the mountains, gradually flackening its pace as it winds among the hills and gentler declivities, and at laft creeping flowly along through the Hat grounds, till it is checked and brought to relt by the tides of the ocean.

Nor is the fecond confequence more agresable to obfervation. It is univerfally found, that the velocity of the finface in the middle of the flream is the greatelt of all, and that it gradually diminifhes from thence to the bottom and fides.

And the frof confequence, if true, would render the running waters on the furface of this earth the inftruments of immediate ruin and devalltion. If the waters of our rivers, in the cultivated parts of a country, which are two, three, and four hundred feet lower than their fources, run with the velocity due to that height, they would in a few minutes lay the earth bare to the very bencs.
'lhe velocities of our rivers, brooks, and aills, being fo greatly inferior to what this theory alligns to them
the other confequences are equally contraty to experience. When a flream has its fection dimininted by narrowing the channel, the current increales in depth, :and this is always accompanied by aa increafe of velecity through the whole of the fection, and mont of all at thee furface; and the ared of the fection does not incresfe, but diminilhes, all the phenomena, thus contradicting iat every circumitance the deduction from the theory; and when the fegtion has been diminithed by a fluice let down into the Aream, the water gradually lizaps cep on the upper fide of the fluice, and, by its preflure, prodnces an acceleration of the fream below the fluice, in the fame way as if it were the beginning of a fteam, as explained in the theory. The velocity now is compoled of the velocity preferved from the fource and the velocity prodaced by this fubordinate accumulation; and this accumulation and velocity continually increafe, till they become fuch that the whole fupply is again difcharged through this contracted fection: any additional water not only.increafes the quantity carried along the fream, but alfo increafes the velocity, and therefore the fection does not increale in the proportion of the quantits.

It is furprifing that a theory rcally founded on a Thetheory conceit, and which in every the molt familiar and obvious circumftance is contradieted by facts, fhould have met with fo much attention. That Varignon fhould immediately catch at this notion of Guglielmini, and make it the fubject of many elaborate analytical me- on the fubmoirs, is not to be wondered at. This author only want- ject, ed coaner prife all ca!'cul; and it was a ufual joke among the academicians of Paris, when any new theorem was invented, donmons le a Varignon a generalifer. But his numerous theorems and corvllaries were adopted by all, and ftill make the fubitance of the prefent fyftems of hydraulics. Gravefande, Mufhenbrock, and all the elementary treatifes of natural philofophy, deliver no other doetrines; ard Belidor, who has been confidered as the firf of all the fcientific engineers, details the fame theory in his great work the Arclitecfure Hydraulique.

Guglielmini was, however, not altogether the eiupe Though of his own ingenuity. He was not only a pretty good fome of the mathematician, but an affiducus and fagacious obferve:. more ingeHe had applied his theory to fome important cafes nious faw which occurred in the comfe of his proteffion as in-and atfpetor of the rivers and canals in the Mlanefe, and to terapted the courfe of the Danube; and could not but perceive to fuply that great corrections were necelfary for making the then. theory quadrate in tome tolerable manner with oblervation; and he immediately faw that the motion was greatly obftrueted by inequalities of the canal, which gave to the contiguous filaments of the fream tranfverfe motions, which thwarted and confufed the regular progrefs of the reft of the fream, and thos checked its geneial progrels. Thefe obdrutions, he oberred, ware molt effectual in the begioning of its courfe, while yet a fmall rill, running among tones, and in a very unequal bed. The -whole firean being fmall, the inequalities bore a great proportion to it , and thus the general effed was great. He alfo faw that the fame caufes (hefe tranfverfe mo:ions produced by the uncqual bottom) chiefly afiected the contiguous flamente, and were the reafons why the velocity at the fides and bottom was fo much diminifhed as to be lefs than the fuperfci:! velocity, and that even this might comz to be K k 2
diminithed
dim.ininitu hy the fame caufe. lior he obferved, that the genetel lireanm of a river is trequently compoled of a fort of boiling or tumbling motion, by which malfes of water are brought up to the furlace and again defeend. Every peition mult recollect fuch appearances in the freftes of a muddy river; and in this way Gugitichmini was enabled to account in tome meafure for the difagrecment of his theory with obervation.

Miariotte had oberved the fame oblructions even in the imoothelt glafs pipcs. Here it could not be alcribed to the cliecks occafioned by tranfecre motions. He therefore aticribed it to tiictim, which he fuppofed to diminifh the motion of fluid bodies in the fame mamer as of folids: and he chence cencludes, that the filaments which immediatiy rub on the fides of the tube have Their velocity gradu.liy dminifhed; and that the filaments immediately atje ining to thefe, being thus obliged to pafs over them or outtrip them, rub upon them, and have their own velocity diminithed ia libe manner, but in a fmaller degree; and that the fucceeding filaments towards the axis of the tube fuffer fimilar but 1:maller diminutions. By this means the whele itream may come to have a maller velocity; and at any :ate the medium velocity by which the quantity dif(harged is determined, is fmaller than it would have been independent of friation.

Gugliclmini adopted this opinion of Mariotte, and in his next work on the Motion of Rivers, confidered this as the chief caule of the retardation; and he added at third circumitanee, which he confidered as of no lefs confequence, the vilcidity or tenacity of water. He obferves that fyrup, oil, and other fluids, where this vifcidity is more remarkable, have their motions prodigioulf retarded by it, and fuppofes that water differs from them only in the clegree in which it poffeffes this guality: and he fays, that by this means not only the particles which are moving more rapidiy have their motions diminithed by thofe in their neighbourhnod which move flower, but that the filaments alfo which would lave moved more flowly are accelerated by their more :ntive neighiours; and that in this manner the fuperficial and inferior velocities are brought nearer to an equality. But this will never account for the univerfal fiet, that the fuperficidl particles are the fwifteft of all. 'line fuperficiul particles, fays he, acquire by this means a greater velocity than the parab lic law allows them; the mectium velocity is often in the middle of the depth; the numerous obflacles, continually multiplied and refeated, caule the current to lofe the velocity acquired by the fall; the flope of the bottom then diminifhes, and often becomes very fmall, fo that the force remain. ing is hardly able to overcome the obftacles which are ftill repeated, and the river is reduced almoll to a fate of fagnation. He cbferves, that the Rheno, a river of the Mlanefe, has near its mouth a thope of no more than 50", which he conliders as quite inauequate to the tak ; and here he introduces another principle, which he cordiders as an effential part of the theory of open currents. This is, that there arifes from the very depth of the fream a propelling force which rellores a part of the lof velocity. He offers nothing in proof ot this principle, but ufcs it to account for and explain the motion of waters in horizontal canals. The principle has been a sopted by the numerous Italian writers on hy draulics, aded, by valous contrivances, interwoven with the para-

E R.
bolic theors, as it is called, of Guglichmin:. Our reader may fee it in various modifications in the ldrafatiac Araulica of P. Lecchi, and in the Sperienze Idrauliche of Micheletti. It is by no means diftimat cither in its origin or in the manner of its application to the explanation of phenomena, and feems only to ferve for giving fomething like confifency to the vague and obfcure difcufions which have been publifhed on this fubject in Italy. We have already remarked, that in that country the fubject is particularly interefting, and has been much commented upon. But the writers ol England, France, and Germany, have not paid fo much attention to it, and have more generally occupied themelves with the motion of water in clofe conduits, which feem to admit of a more precife application of mathematical reainning.

Some of thofe have confidered with more attention Sir 1 fuace the effects of fristion and vifcidity. Sir Ifaac Newton, Newton's with his ufual penetration, had ficen dintinclly the manner in which it behoved thefe circumflances to operate. He had occation, in his refearches into the mechanifm of the celeftial motions, to examine the famous hypothefis of Defcartes, that the planets were carried round the fun by fluid vortices, and fars that there would be no end to uncertainty and difpute till the modus operandi of the vortices was mechanically confidered. He therefore employed himfelf in the invefigation of the manner in which the acknowledged powers of natural bodies, acting according to the received laws of mechanics, could produce and preferve thefe vortices, and refore that motion which was expended in carrying the plancis round the fun. He therefore, in the fecond book of the Principles of Natural Philufoply, gives a feries of beautiful propolitions, viz. 51,52, \&cc. with their corol'aries, flowing how the rotation of a cylt.der or fphere round its axis in the midit of a fluid will excite a vortical motion in this flud; and he afcertains with mathematical precifion the motion of every fitament of this vortex.
He fets out from the fupp fition that this motion is excited in the furrounding fratum of fluid in confequence of a want of periect lubricity, and alliumes as an liypothefis, that the initial refiftance (or diminution of the motion of the cylinder) which arifes from this want of lubricity, is proportional to the velocity with which the furface of the cylirder is feparated from the contiguous funface of the furrounding fluid, and that the whole refiftance is proportional to the velocity with which the parts of the fluid are mutually feparated from each other. lirom this, and the equality of action and re-action, it evidently follows, that the velocity of any fratum of the vortcx is the aritlimetical medium between the velncities of the frata immediately within and wihout it. For the intermediate flratuni cannot be in equilibrio, unlefs it is as much prelied furward by the fuperior motion of the itratum within it, as it is kept back by the flower motion of the Aratum without it.
'This beautíul invefigation applies in the mof perfect manner to every change produced in the motion of a fluid filment, incon!equence of the vifcidity and iriction of the adjung filancents ; and a filament proceeding along a tube at fome imall diltance from the frdes has, in like manner, a vele ity which is the medium between thole of the filaments immedrately funounding
\(\underbrace{\text { Theorg. }}\) ii. It is therefore a problem of \(n\), very difficult folu-
tion to affign the law by which the velocity will matually diminithas the filament recedes from the axis of a cslindrical tube. It is fomewhat furprifing that fo reat a problem has never occupied the attemtion of the mathe maticians duling the time that thefe fubjeits were fo afiduounly fudied; but fo it i , , that nothing precife has been publithed on the fubje?. 'IYc only approach io a diffuffion of this Lind, is a Memoire of Mr Prot, read to the academy of Paris in \(1-26\), where lie contiders the velocity of efllux through a pipe. He e, by at ending to the comparative fuperionity of the quantity of motion in large pife., lie afirms, that the totai diminution, arifing from (riction will be (cote is paribis) in the iuverfe ratio of the dianieters. This was thankfully received by oller writers, and is now a part of our hydraulic theories. It has not, however, been attended \(t\), by thole who write on the motion of rivers, though it is evident that it is applicable to there with equal propicty; and had it been introduced, it would at once have fulved all their difficuities, and particularly would have flown how an almoft imperceptible declivity would produce the gentie moti \(n\) of a great river, without having recourse to the uninielligibie principle of Guglie.mini.

Mr Couplet made fome experiments on the motion of the water in the great main prpes of Verfalles, in order to obtain fome notions of the rctur dation occafioned by friction. They were found prodigisus; but were fo irregular, and unfufceptibie of reducto 1 to any general rinciple, (and the experiments wete indeed io few that they were unfit for this recuation), that he could eftablith ron theors. - What Mr Belidor ellablifhed on them, and makes a fort of fyitem to direct future engineers, is quite unworthy of attention.

Upon the whole, this branch of hydraulics, although of mach greater practical importance than the couduct of water in pipes, has never yet obtained more than a sague, and, we may call it, flovenly attention from the mathematicians; and we aletibe it to their not having taken the pains to fette its firf principles with the f:me precifion as had teen done in the other bratich. They were, from the beginning, fatisfied with a fort of applicability of mathematical principles, without ever naking the application. Were it nct that fome would accufe us of national partiality, we would alcribe it to this, that Newton had not pointed out the way in this as in the other branch. For any intelligent reader of the performances on the motions of fluids in cloie veffels; will fee that there has not a principle, nay hard'y a ftep of inveligation, been added to thufe which were ufed or pointed out by Sir Ilaze Newton. He has nowhere tonchided this queflion, the motion of water in an open canat. In his theories o: the tides, and of the propagation of waves, he hid an excellent opporturi:y for giving at once the fundamental principles of motion in a free fluid wlonfe furface was not horizontal. But, by means of fome of thofe happy and hrewd guefes, in which, as Daniel Bernonllif fus, he excelled all men, lie faw the undoubted comfequences of fome palpable phenomenon which would antwer all his prefent purpofes, and therefore entered no farther into the invelligation.

The original theory of Guglielmini, or the principle 2dopted by him, that each paticle of the rertical fec-
tion of a running fream has a tendency to move as if it were ilfuing finm an oifice at that depth under the farlace, is falie; and that it really does fo in the face of a dam when the flood-gate is taken away, is no lefs fo; and if it dit, the fubtiequent motions would hatdly have -ny refemulance to thnte which he affigns them. Were this the cafe, the exterior form of the cafeade would be fomething like what is fketched in fig. 3. with an abrupt angle at 13 , and a cuncave furface 13 EG. This mill Le evident to every one who combines the greater velocity of the lower filanients with the flower motion of thofe which mult fide down above them. But this greater advance of the lower filaments cannot take place Fithout an expenditure of the water under the furface AB. The fuiface th.e:efore firks, ard B inflantly ceafes to retain its place in the horizontal plane. The water does not fuccefively flow friward from A to D , and then tumble over the precipice; but immediately upon npening the flood-gate, the water waltes from the fpace immediately hehind it, and the whole puts on the form repreferited in fig. 4. confifting of the curve A a PcEG, convex from A to \(c\), and concave from thence fotward. The fuperficial water begins to accelerate all the way from \(A\); and the particles may be fuppofed (for the prefent) to have acquired the velocity correfponding to their depth under the horizontal furface. This mult be underfond as nothing more than a vague \(k\) etch of the \(m\) tions. It requires a very crit cal and intricate inveftigation to determine eicher the form of the upper curve or the motions of the different filaments. The place A, where the curvature begins, is of equally difficult determination, and is various according to the differences of depth and of inclination of the fucceeding canal.

We have given this fort of hiftory of the progrefs Uncerwhich had been made in this part of hydraulics, that tainty of our readers might form fume opinion of the many dif- ries theo fertations which have been written of the motion of rivers, and of the fate of the arts depending on it. practicecs Nuch of the bufinefs of the civil engineer is intimately emplificd. connected with it : and we may theretore believe, that. fince there was folitule principle in the theories, there could be but very little certainty in the practical operations. The fact has been, that no engineer could pretend to fay, with any precifion, what would be the effect of his operations. One whofe bufinefs had given him many opportunities, and who kept accurate and judicious regifers of his own works, could pronounce, with fome probability, how much water would be brought off by a drain of certain dimenfions and a given flope, when the circumflances of the cafe happened to tally with fome former work in which i.e had fucceeded or failed; but out of the pale of his own experience he could only make a fagacious guefs. A remarkable inftance of this occurred notlong ago. A fmall aqueduct was lately carried into Paris. It had been conducted on a plan prefented to the academy, who had currcited it, and gave a report of what its performance would be. When executed in t'e mof accurate man. rier. it was deficient in the proportion of five to nine. When the celehrated Defaguliers was employed by the city of Edinburgh to fuperintend the bringing in the water for the fupply of the city, he gave a report on the plan which was to be followed. It was execu. ted to his complete fatisfaction; and the quantity of

Thenry. \(\underbrace{\text { Thenr: }}\)

Necuflity of mu: rlying exJuthaicats, Water delivered was about one fixth of the quantity
which he promifed, and about ons-eleventh of the quantity which the no lefs celebrated in Laurin calculated from the fame plan.

Such bcing the flate of our theorctical knowledge (if it can be called by this rame), iaturalifts began to be ferfuaded that it was but lofing time to make any ufe of a theory fo incorgruous with obiervation, and that the only falc method of proceeding was to multiply experiments in every variety of circumlances, and to make a feries of exporiments in every inportant cafe, which frould comprcherd all the practiadule modifications of that cale. Perhaps circumHances of refemblance might occur, which would enable us to comacet many of therm together, and at laft difcover the principles which occalicned this conneation; by which means a theory fornded on ficience might be obtained. And if this point fhould not be gained, we might perhaps find a fex general facts, which are modified in all thefe pasticulat cafes, in fuch a mamer that we can filltrace the general facts, and fee the part of the particular cafe which depends on it. This would be the acquifition of what may be ealicd an empirical theory, by which every plenomeron would be explaired, in fo far as the explanation of a plenemenon is nothing more than the pointing out the genecal that or law under which it is comprehended; and this theory would anfiwer every prastical purpofe, becaufe we thould confidently forefee that conifequences would refult fiom luch and fuch premires; or if we fhon!d fail even in this, we fhould thill have a ferics of experiments fo comprelientive, that we could tell what place in the feries would correfpond to any particular cafe whilh might he propoled.
\({ }^{2} 9\) 1.abours of Micheloti fped deferve wery prricular rotice profelfor Mis and Buffut lotti at 'lurin, and Abbé Boflut at Prorefis. The firt in thisway, made a prodigicus number of experiments both on the motion of water through pifes and in epen canals. They were performed at the espence of the fovereign, and no expence was lpared. A tower was built of the fineft mafonry, to felve as a veffel from which the water was to iffuc though holes of various fizes, under preflures frem \(;\) to 22 feet. The water was received into bafons contrugted of mafonry and nicely lined with Rucco, from whence it was conveycd in canals of brickwork lined with fucco, and of various forms and declivities. The experiments on the expence of water through pipes are of all that have yet been made the mort numerous and exat, and may be appealed to on every occafion. Thofe made in open canals are fill more numerous, and are no doubt equally accurate; but they have not been fo contrived is to be fo gencrally weiul, being in general very unlike the important cafes which will occur in prastice, and they feen to have been contrived chielly with the view of eftablilhing or overturning certain points of hydratic doarine which were probably prevalent at the time among the practical hydraulift

The experiments of Boffut are alfo of both kinds; and though on a much fmainir fale than thofe of Michelotti, feem to deferve equal conlidence. As fir as they follow the fame tiack, they perfectly coincide in their refults, which foould procure confidence in the other; and they are made in fituations much more analogous to the ufud pareicn! cater. T?.is makes
then doubly valuatie. They are to be found in his Thenry. two rolumes intiled Hydrotynamique. He has opened this path of procedure in a maner fo new and to judicious, that he has in iome meafure the merit of fuch as flall follow him in the fume path.

This has been moft candidly and liberally allowed And the him by the chevalier de Buat, who has taken up this progrefive matter where the Abbe Boffiut left it, and has profecuted his experiments with great affiduity; and we muft now add with fingular fuccefs. By a very judicions confiduration of the fubject, he hit on a particular view of it, which faved him the trouble of a minute confideration of the fmall internal motions, and en.bled him to proceed from a very general and evident propolition, which may be received as the key to a complete fyllem of practical hydraulics. We fall follow this ingenius author in what we have farther to fay on the fubject ; and we doubt not but that our readers will think we do a fervice to the public by making thefe difcuffions of the chevalier de Buat more generally known in this cuuntry. It mult not however be expected that we fhall give more than a !ynoptical view of them, conneted by fuch faniliar reafoning as fhall be either comprehended or confided in by perions not deeply verfed in mathermatical fiesce.

\section*{Sect. I. Theory of Rivers.}

It is certain that the motion of open fireams muft, His lexding in fume refpects, refemble that of bodies fliding doun pronofinclined planes perfectly poliffed; and that they would tior. acceleratc continually, were they not obltructed: but they are obftuited, and frequently move uniformly. This can only aride from an equilibrium between the foress which promote their defeent and thole which oppofe it. Mr Buat, therefore, affumes the leading propofition, that

When suder flows uniformly on any channel or le!, the accelerating force owhicis obliges it to move is eqzal to the fums of all the refflances wolsch it meets with, sutether arifing from its owin rifcility, or from the friftion of its bed.

This low is as old as the formation of rivers, and fhould be the key of hydraulic fience. Its evidence is clear; and it is, at any rate, the bafis of all uniform motion. And fince it is fo, there mult be fome confiderable analogy between the motion in pipes and in open channels. Both owe their origin to an inequality of preifure; both would accelerate continually, if nothing hindered; and both are reduced to unilormity by the vifcidity of the fluid and the friction , \(f\) the channel.
It will therefore be convenient to examine the phenomena of water moving in pipes by the ation of its weight only along the floping channsl. But previous to this, we malt take fume notice of the cobftruction to the entry of water into a channel of any kind, arifing from the deflection of the many different filaments which prefs into the channel from the refervoir from every fide. Then we fhall be able to feparate this diminution of motion from the fum total that is obferved, and afeertain whot part remains as produced by the fubfequent obftructions.

We then hall confider the priseiple of uniform \(m\) 3tion, the equilibrium between the power and the refiftance. The power is the relative height of the column of fluid which tends to meve along the it:clined plane of its bed ; the refifance is the friation
\(\underbrace{\text { Thcory. }}\) of the bed, the vifcidity of the fluid, and its adhefion to the fides. Here are necelfarily combined a number of circumftances which mut be gradually detached that we may fce the effect of each, viz. the extent of the bed, its perimeter, ard its flope. By examining the effects produced by variations of each of thefe feparately, we difcover what fhare cach lins in the general effert; and having thus analyfe 1 the complicated phenomencn, we fhall be able to combine thofe its elements, and frame a formula which fhall comprehend every circumfance, from the greatef velocity to the extinction of all motion, and from the extent of a river to the narrow dimenfions of a quill. We thall compare this formula with a feries of experiments in all this variety of circumfances, partly made by Mr Buat, and part!y collected from other authors; and we thall leave the reader to judge of the agreement.

Confident that this agreement will be found molt f:ittisfactery, we fhall then proceed to confider very curforily the chicf varieties which nature or art may introduce into thefe beds, the different velocities of the fime fream, the intenfity of the refillance produced by the incrtia of the materials of the chanmel, and the force of the current by which it continually acts on this channel, tending to change cither its dimenfions or its form. We fhall endeavour to trace the origin of thefe great rivers which fpread like the branches of a vignrous tree, and occupy the furface even of a valt continent. We fhall follow them in their courfe, unfold all their windings, ftudy their train, and regimen, and point out, the law of is ftability ; and we flall inveftigate the caufes of their deviatiors and wanderings.

The fucly of thefe natural laws pleafes the mind: but it anfwers a ftill greater purpofe; it enables us to affit nature, and to haften her oferations, which wur wants and our impatience often find too llow. It chables us to command the elements, and to forse them to adminifter th our wants and our pleafures.

We fhall therefore, in the next place, apply the knowledge which we may acquire to the folution of the moft important hydraulic queftions which occur in the prat̃ice of the civil engineer.

We fall confider the effects produced by a permanent addition to any river or fream by the union of another, and the oppofite effect produced by any dranght or offset, fhowing the elevation or depieftion produced up the fiteam, and the change mad: in the depth and velocity below the addition or offet.

We fhall pay a fimilar attention to the temporary fuells produced by frefhes.
We fhall afcertain the effects of fraightening the courfe of a fream, which, by increaing its flope, mult increafe its velocity, and therefore fink the waters above the place where the curvature was removed, and diminifh the tendency to overflow, while the fame immediate copferfuence muft expofe the places farther down to the rifk: of floods from which they would other wife have been free.
The cffets of dams or weirs, and of bars, mull then He confidered ; the gorge or fwell which they produce up the fireain munt be determined for every diftance fiom the weir or bar. This will furnifh us with rules for rendering narigable or floatalle fuch waters as have too little depth or to great flope. And it will appear
that immenfe adra-tages may b: thus derired, with a moderate expence, even from trifling brooks, if we wil relinquifh all prejudices, and not imagine that fuch conveyance is impolfible, becaure it canrout be carried on by fuch boats and fmall craft as we have been accultomed to look at.

The ciects of canals of derivation, the rules or maxims of draining, and the general maxims of embarkment, come in the next place; and our difolfions will conclude with remarks on the mof proper forms for the entry to canals, locks, docks, harbours, and moutlis of rivers, the beft thape for the farlings of bridges and of boats for inland navigations, and fuch like fubordinate but interefting particulars, which will be fuggefted by the general thread of difculfion.

It is confidered, as phyfically demonfrated (fee \(\mathrm{H}_{\mathrm{r}}\) - Natural vedrostaries and Hyipaleics), that water iffuing locity, exfrom a fmall orifice in the bottom or fide of a very large pence and veffel, almoft inftantly acquires and maintains the velo. difcharge city which it heavy body would acquire by falling to througt. the orifice from the horizontal furface of the Aagnant water. This we fhall call its Natural Velocitr. Therefore if we multiply the area of the orifice by this velocity, the product will be the bulk or quantity of the water which is difcharged. This we may call the Natural Expesce of water, or the Natural Dischagge.
Let \(O\) reprefent the area or festion of the orifice erpreffed in fome known meafure, and \(b\) its depth under the furface. Let \(g_{g}\) expreis the velocity acquired by a heavy body during a fecond by falling. I et \(V\) be the mediuni velocity of the water's motion, \(Q\) the quantity of water difcharged during a fecond, and N the natural expence.

We know that \(V\) is equal to \(\sqrt{2 ;} \times \sqrt{ } /\). Therefore \(\mathrm{N}=\mathrm{O}, \sqrt{2 g} \cdot \sqrt{ }\).

If thefe dimenfions be all taken in Englifi feet, we have \(\sqrt{2 g}\) very n :arly equal to 8 ; and therefore \(\mathrm{V}=\) \(8 \sqrt{ } h\), and \(N=0.8 \vee h\).

But in our prefent bufmeís it is much more convenient to mealure every thing by inches. Thercfore fince a body acquires the velocity of 32 feet 2 inches
in a fecond, we have \(2 g=6+\) feet 4 inches ar 772 inch. fince a body acquires the velocity of 32 feet 2 inches
in a fecond, we have \(2 g=6+\) feet 4 inches ar 772 inch. es, and \(\sqrt{2 g}=27,78\) inches nearly \(27 \frac{3}{4}\) inches.
Therefore \(\mathrm{V}=\sqrt{77^{2}} v^{\prime} h,=27,78 \sqrt{ } /\), and \(\mathrm{N}=\mathrm{O}\). \(\sqrt{772} \sqrt{ } b=0.27,78 \sqrt{ } h\)

But it is alfo well known, that if we were to calcu. late the expence or difcharge for every orifice by this fimple rule, we fhould in every inflance find it much greater than nature really gives us.

When water iffues through a hole in a thin plate, the lateral columns, preffing into the hoie from all fides, caufe the iffuing flaments to converge to the axis of the jet, and contract its dimenfions at a little diftance from the hale. And it is in this place of greateft confrom the hole. And it is in this place of greatelt con-
traction that the water acquires that velocity which we obferve in our experiments, and which we affume as equal to that acquired by falling from the furface. Therefore, that out computed difcharge mas belt agree with obfervation, it muft be calculated on the fuppofition that the orifice is diminifhed to the fize of this frmalleft feftion. But the contradion is fubject to va. riations, and the dimenfions of this fmalleft fection

\footnotetext{

} E are
are at ail simes difficult to afcestain with precifion. It is theectore much more convenient to compute from the real dimentions of the orifice, and to correct this computed difcharge, by reans of an afoual comparifon of the computed and effective difcharges in a feries of experiments made in fitnations refembling thot: cafes which moft frequently occur in practice. This correctien or its caufe, in the mechamifm of thofe internal motions, is generally called Contraction by the writers on hydratics; and it is not confined to a hole in at thin plate: it hapens in fome degree in all cafes where fluids are made to pals through narrow places. It happens in the entry inen all pipes, canals, and fuices; nay even in the patige of water over the edge of a board, fuch as is ufually fet up on the head of a dam or weir, and even when this is immerfed in water on both fides, as in a bar or keep, frequently cmployed for raifing the waters of the level freams in Flanders, in order to render them navigable. We mentioned an obfervation \(\oint\) of Mr Buat to this ef. feet, when he faw a goofberry sife up from the bottom of the canal along the face of the bar, and then rapidly fy over its top. We have attempted to reprefent this motion of the filaments in thefe different fituations.

Fig. 5. A thows the motion through a thin plate.
\(B\) thows the motion when a tube of about two diameters long is added, and when the water flows with a full mouth. This does not always happen in fo thort a pipe (and never in one that is forter), but the water frequently detaches itfelf from the fides of the pipe, and flows with a contracted jet.

C thows the motion when the pife projects into the infide of the vallel. In this cafe it is difficult to make it flow full.

Dreprefents a mouth-piece fitted to the hole, and formed agreably to that thape which a jet would affume of itielf. In this cafe all contraction is avoided, becaufe the mouth of this pipe may be confidered as the real orifice, and nothing now diminifhes the difcharge but a trifling friction of the fides.

E thows the motion of water over a dam or weir, where the fall is free or unobltructed; the furface of the lower ftram being lower than the edge or lole of the wafte-board.
\(F\) is a fimilar reprefentation of the motion of water over what we w, uld call a \(l . n\) or kecp.

It was one great aim of the experiments of Michelotti and Bolfu: to determine the cffects of contration in thele cafes. Nichelotit, after carefully obferving the form and dimenfions of the natural jet, made various mouth-pieces refembling it, till he abtained one which produced the finallef diminution of the computed difcharge, or till the difcharge computed for the area of its imaller end approached the nearelt to the effective difcharge. And he at laft obtained one shich gave a difcharge of 983 , when the natural difcharge would have been a 1000 . 'This piece was formed by the revolutinn of a trochoid round the axis of the jet, and the dimonfions were as flllow:
\[
\begin{aligned}
\text { Diameter of the cuter orifice } & =36 \\
\text { lengil of the inis } & =46 \\
& =46
\end{aligned}
\]

The refults of the experiments of llic Abbe Boffit and of Michelot:i fearcelv differ, and they are exprefled in the fullowing table:
N. or the natural expence

Q for the thin plate fig. \(A\}\) Q for ditto at the depth of si feet \(Q\) ire ditto at the deptli of 16 feet Uior a tube 2 diamcters lone c , \(\}\) tig. 13.
Qtor di:to projecting inwards \(\}\)
and flowing lull
Qfor ditto with a contrakted jet,
fig.
Q for the mouth-piece, fig. D. Sor al weir, fig. E. Cfor a bar, fig. F.
\(12000=0.27,78 \sqrt{ } 6 \underbrace{\text { Theory. }}\) \(65260.18,13 \mathrm{~V} / 2\)
\(61950.17,21 \sqrt{ } 6\)
\(61730.17,15 \sqrt{ } / 2\)
\(\$ 125 \quad 0.22,57 \sqrt{ }\) is
\(681+0.18,93 \sqrt{ } 6\)
\(51370.14,27 \sqrt{6}\)
\(9^{5} 31\) 2.27,31 \(\sqrt{\text { li }}\)
\(9536 \quad 026,49 \sqrt{ } /\)
\(9730 \quad 0.27,03 \sqrt{ } /\)

The numbers in the laft column of this little table are the cubical inches of water difcharged in a fecond when the height \(b\) is one inch.

It muft be oblerved that the difcharges affigned here for the weir and bar relate only to the contraclions occafioned by the paflage over the edge of the board. The weir may alfo fuffer a diminution by the contractions it its two ends, if it thould be narrower than the fream, which is geneally the cafe, becaufe the two ends are commonly of fquare mafonry or woodwork. The contraction there is nearly the fame with that at the edge of a thin plate. But this could not be introc?uced into this table, becaufe its effect on the expence is the fame in quaratity whatever is the length of the watte-board of the weir.

In like manner, the diminution of difcharge through Diminua fluice could not be expreffed here. When a fluice is tion of difdrawn t!p, but its lower edge fill remaing under water, charge the difcharge is contrafted both above and at the fides, through a and the diminution of difcharge by each is in propor- nuice, \&s. tion to its extent. It is not eafy to reduce either of thefe contrations to computation, but they may be very eafily obfcred. We frequently can oblerve the wa. ter, at coming out of a fluice into a mill-courfe, quit the edge of the aperture, and fhow a pait of the bottom quite dry. This is always the care when the velocity of efllux is confiderable. When it is very moderate, this place is occupied by an eddy water almoft flagnant. When the head of the water is S or 10 inches, and runs off freely, the fpace left between it and the fides is about \(1 \frac{1}{2}\) inches. If the fides of the entry have a flope, this void pace can never appear; but there is always this tendency to convergence, which diminifhes the quantisy of the difcharge.

It will frequently abridge computation very much to conlider the water difcharged in thefe different fituations as moving with a common velocity, which we conceive as produced not by al fall from the furface of the fluid (which is exact only when the expence is equal to the natural expence), but by a fall \(b\) accommodated to the difcharge: or it is convenient to know the height which would produce that vary velocity which the water ilfues with in thefe fituations.

And allo, when the water is obferved to be actuaily moving with a velocity \(V\), and we know whother it is coming through a thin plate, through a tubs, over a Jam, \&ic. it is necelfary to know the preffure or HEAD of whter \(力\) which has aflually produced this velocity. It is convenient thatefore to have the following nuntbers in readinefs.

Theory. \(\underbrace{\text { Ther }}\)
 \(b\) for a thin plate \(\quad=\frac{\mathrm{V}^{2}}{295}\) b for a tube 2 diam. long \(=\frac{\mathrm{V}}{505}\) b for a dam or weir \(=\frac{\mathrm{V}^{3}}{726}\)
b for a bar \(=\frac{V^{2}}{74^{6}}\)
It was neceffary to premife thefe facts in hydraulics, that we may be able in every cafe to diftinguilh between the force expended in the entry of the water into the conduit or canal, and the forec employed in overcoming the refiftances along the canal, and in preferving or accelerating its motion in it.
The motion of rumning water is produced by two caufes; 1 . The action of gravity; and, 2 . The mobility of the particles, which makes them aflume a level in confined veffels, or determines them to move to that fide where there is a defect of preffure. When the furface is level, every particle is at relt, being equally preffed in all directions; but if the furface is not level, not only does a particle on the sery furface tend by its own weight towards the lower fide, as a body would flide along an inclined plane, but there is a force, external to itfelt, atifing from a fuperiority of preffure on the upper end of the furface, which pulhes this fuperficial particle towards the lower end; and this is not peculiar to the fuperficial particles, but affeets every particle within the mafs of water. In the veffel ACDE (fig. 6.), containing water with an inclined furface AE, if we fuppofe all frozen but the extreme columns AKHB, FGLE, and a connecting portion HKCDLG, it is evident, from hydroflatical laws, that the water on this connecting part will be pufhed in the direction CD; and if the frozen mafs BHGF were moveable, it would alfo be pufhed along. Giving it fluidity will make no change in this refpeet; and it is indifferent what is the fituation and fhape of the connecting column or co. lumns. The propelling force (MNF being horizontal) is the weight of the column AMNB. The fame thing will obtain wherever we feleat the vertical columns. There will always be a force tending to pulh every particle of water in the direction of the declivity. The confequence will be, that the water will fink at one end and rife at the other, and its furface will rett in the horizontal pofition \(a \mathrm{O} e\), cutting the former in its middle O. This cannot be unlefs there be not only a motion of perpendicular defcent and afcent of the vertical columns, but alfo a real motion of tranflation from K to. wards L. It perhaps exceeds our mathematical fkill to tell what will be the motion of each particle. Newton did not attempt it in his inveltigation of the motion of waves, nor is it at ail neceffaty here. We may, however, acquire a very diftinct notion of its general effect. Let OPQ be a vertical plane paffing through the middle point \(O\). It is evident that every particle in PQ , fuch as \(P\), is preffed in the direstion \(Q D\), with a force equal to the weight of a fingle row of particles, whofe length is the difference between the columns BH and FG. The force acting on the particle () is, in like manuer, the weight of a row of particles \(=A C-E D\). Now if \(O Q, O A, O E\), be divided in the fanc ratio, fo :hat

Vol. XVI.
all the figures \(\mathrm{ACDE}, \mathrm{BHCF}\), \&c. may be fimilar, Theory. we fee that the force arifing folely frem the declivity and ading on each particle on the plane \(O Q\), is proportional to its depth under the furface, and that the row of particles ACQDE, BHPGF, \&c. which is to be moved by it, is in the fame proportion. Hence it unqueltionably follows, that the accelerating force on eachparticle of the row is the fame in all. Therefore the whole plane OQ tends to advance forward together with the fame velocity ; and in the inflant immediately fucceeding, all thefe particles would be fuund again in a vertical plain indefinitely near to OQ ; and if we fum up the forces, we fhall find them the fane as if \(O Q\) were the opening of a fluice, having the water on the fide of D ftanding level with \(O\), and the water on the other fide flanding at the height AC. This refult is extremely different from that of the hatty theory of Guglielmini. He confiders each particle in \(O Q\) as urged by an accelerating force proportional to its depth, it is true ; but he makes it equal to the weight of the row OP, and never recollects that the greatef pait of it is balanced by an oppofite preffure, nor perceives that the force which is not ballanced mu!t be dilributed among a row of particles which varies in the fame proportion with itfelf. When thefe two circumfances are neglected, the refu't mult be incompatible with obfervation. When the balaneed forces are taken into the account of preflure, it is evident that the furface may be fuppofed horizontal, and that motion fhould obtain in this cafe as well as in the cafe of a floping furface: and indeed this is Guglielmini's profefed theory, and what he highly values himfelf on. He announces this difcovery of a new principle, which he calls the enatgy of deep waters, as an important addition to hydranlies. It is owing to this, fays he, that the great rivers are not ftagnant at their mouths, where they have no perceptible declivity of furface, but, on the contrary, have greater energy and velocity than farther up, where they are fhallower. This principle is the bafis of his improved theory of rivers, and is infifted on at great lengeth by all the fubfequent writers. Buffon, in his theory of the earth makes much ufe of it. We cannot but wonder that it has been allowed a place in the theory of rivers given in the great Encyclopédie of Paris, and in an article having the fignature \((O)\) of D'Alembert. We have been very anxious to fhow the falfity of this principle, becaufe we confider it as a mere fubterfinge of Guglielmini, by which he was able to p.tely up the mathematical theory which he had fo haltily taken froms Newton or Galileo; and we think that we have fect1red our readers from being mifled by it, when we thow that this energy muft be equally operative when the furface is on a dead level. The abfurdity of this is evident. We fhall fee by and by, that decp waters, when in actual motion, have an energy not to be found in fhallow running waters, by which they are enabled to cnntinue that motion: but this is not a moving principle ; and it will be fully explained, as an immediate refult of principles, not vaguely canceived and indiAtinsly exprefed, like this of Guglielmini, but eafily underfood, and appreciable with the greateit precifion. It is an energy common to all great bodics. Although they lofe as much momentum in furmounting any ob. ftacle as fmall ones, they lofe but a fmall portion of their velceity. At prefent, emploged only in confider-

L 1
ing
ing the progreffive anotion of an open fiream, whofe furface is notlevel, it is quite ct:ough that we fee that fiuch a motion mu.z obtain, and that we fee that there are prepelling forces; and that thofe iorces arife f.lify irom the want of a level furfiace, or from the fl.pe of the furface; and tiat; ; with refpers to any wre particle, the force acting on it is proportional to the diflerence of level between each of the two columns (one on each fide of the particle) which produce it. Were the furface level, there would be mo mution; if it is not level there will be motinn; and this motion will be proportional to the want of level or the declivity of the furfice : it is of no corlequence whether the bottom be level or not, or what is its thape.
Hence we draw al fundamental principle, that the motion of rivers deppands entirely on the fope of the furfure.
The stope or declivity of any inclined plane is not properly expreifed by the difference of height alone of its extremilies; we munf al.o conufider its length : and the mealure of the \(\cap\) pe muft be fuch that it may be the fance while the declivity is the fame. It muft therefire be the fame over the whole of any one inclined piane. We thall anfwer thefe conditions exactly, if we take ior the meafure of a fope the fration which ex. prelfics the elevation of one extremity above the other divided by the length of the plane. Thus \(\frac{A M}{A F}\) will
exprefs the declivity of the plane AF.
If the water met with no refiftance from the bed in which it rnis, if it hal no adhefion to its fides and bottom, and if its fluidity were perfect, its gravity would accelerate its courfe continually, mad the earth and its inhabitants would be deprived of all the advantages which they derive from its numberlefs fll eams. They would tun off fo quickly, that our fields, dried up as foon as watered, would be barren and ufelefs. No foil could refilt the impeturtity of the torrents; and their acceierating force would render them a deftroying fcourge, were it not that, by kind Providence, the refiltance of the bed, and the vificidity of the fluid, becorne a check which reins them in and fets bounds to thair rapidity. In this mannet the friction on the fides, which, by the viricidity of the water, is communicated to the whole mafs, and the very adhefinn of the particles to each other, and to the fides of the channel, are the caufes which make the refifances bear a relation to the veloci:y; fo that the refifances augmenting with the velocitics, come at laf to balance the accelerating force. Then the velocity now acquired is preferved, and the m ntion becomes unifurm, without being able to acquire new iscreafe, nulefs fone change fuccecds either in the flope or in the capacity of the channal. Hence arifes the fecond maxim in the \(m\) tion of rivers. that tubin a Iream moves uniformly, the reffance is cqual to the aceleratiry force.
As in the umux of water hirnugh orifices, we pafs over the very begi ning of heaccterated motiwn, which is a motier of ipeculative curiffity, and confider the mo ion in a Rate of permanency, depending on the head of wa.er, the are af the orifiee, the velncity, and the expence; for, in the thenv of the uniform motion of livers, we cenlider the flope, the traniverfe fection or area of the fleam, the uniticm vclocity, and the cx.
pence. It will be conwcricnt to affix frecie meanings to the terms which we thall employ.
'The sectios of a theam is the area of a plane per- Termsprependicular to the direction of the general motion.

The refiftances arife ultinately from the action of the plaiwed. water on the internal fulface of the clamel, and mut be proportional (cateris p.aribus) to the extent of the attion. Therefore it we unfold the whole edge of this fertion, which is tubbed as it were by the palling water, we thall have a meafure of the extent of this set.on. In a pipe, circular or prifmatical, the whole circumference is ated on; but in a river or canal \(A C D C\) (fig. 6.) the horizontal line \(a \mathrm{O}\), whicl makes the upper boun. dary of the fection \(a \mathrm{CD} e\), is free from all action. The astion is confined to the three lines a \(\mathrm{C}, \mathrm{CD}, \mathrm{D}\) e. We flall call this line \(a \mathrm{CD}\) e the border of the fection.

The mean velocity is that with which the whole fcetion, moving equally, would generate a folid equal to the expence of the fream. Tlis velocity is to be found perliaps but in one filament of the ffream, and we do rot know in which filament it is to be found

Since we are attempting to eltablifh an empirical thenry of the motion of rivers, founded entircly on experinient and palpable deduction.s from them ; and fince it is extremely difficule to make experimients on open Atreams which fh.ll have a precifion fufficient for fuch an important purpofe-it would be a moll defirable thing to demonfrate an exact analogy between the mutual balancing of the acceleration and refittance in pipes and rivers; for in thise we can not only make experimen:s with all the defired accuracy, and admituing piecife meafures, but we can make them in a number of cafes that ,re almof impracticable in 1 ivers. We can increare the flope of a pipe from nothing to the vertical potition, and we can employ every dcifired dcgree of preflure fo as to afcertain its effer on the velocity in degrees which open ftreanis will not admit. The Chevalier de Buat has moft happily tucceeded in this demonftration; and it is here that his \(g\) od fortune and his penetration have done fo much sev vice to practical fcience.
Let \(A B\) (fig. 7.) be a horizontal twbe, through The accele which the water is impelled by the preffire or head ration and D.A. This head is the moving power; and it may be crnceived as confifing of two parts, perfor: ming two diftinct offices One of them is employed in impref. fing ' 11 t the water that vel. city with which it aturally mones in the tule. Were there no obticuation to this motion, no greater head would be wamted ; but there are cofruacicns arling from friation, adhf fion, and vifcidity. This requires fonce. Let this be the office of the rell of the head if water in the refervoi,. Tiere is but one alletment, apprimpriati \(刀\), or repartiton, of the whole head which will antiver. Supptie E to be the point of partition, fo that DE is the bead neceffary for impreffig the alual velo ity on the water (a head on proffure which has a ellutinn to the torm or circunntance of the e try, and the conirati. n which takes place there). The reft EA is whilly emp'ryed in overcoming the finsulatateou recifitane whit h ike place along the hole tibe \(A B\), and is in tynuitibrio with thi, iefill in e. Theerfire if we apply at E a tube EC of the lame length and diameter with \(A B\),

\section*{Part I.}

K I V E R.

Theory. and having the fame degree of polifh or roughnefs; and \(\underbrace{}_{\text {if this tube be inelined in fuch a manner that the axis }}\) of its extreimty may coincide with the axis of \(A B\) in the point C-we affirm that the velocity will be the fame in both pipes, and that they will have the fame expence; for the moving force in the floping pipe EC is compofed of the whole weight of the column DE and the relative weight of the column EC; but this relative weight, by which alone it defeends along the inclined pipe EC, is precifely equal to the weight of a vertical column EA of the fame diameter. Every thing therefore is equal in the two pipes, viz. the lengths, the diameters, the moving forces, and the refiftances; therefore the velocities and difcharges will alfo be equal.

This is not only the cafe on the whole, but alfo in every part of it. The relative weight of any part of it EK is precifely in equilibrio with the refiltances along that part of the pipe; for it has the fame proportion to the whole relative weight that the refiftance has to the whole refiftance. Therefore (and this is the moft important circumplance, and the bafis of the wobole theory) the pipe EC may be cut thorter, or may be lengthened to infinity, without making any change in the velocity or expence, fo long as the propelling head DE remains the fame.

Leaving the whole head DA as it is, if we lengthen the horizontal pipe \(A B\) to \(G\), it is evident that we increafe the refiftance without any addition of force to overome it. The velocity muft therefore be dimininhed; and it will now be a velocity which is produced by a. fmaller head than DE : therefore if we were to put in a pipe of equal length at \(E\), terminating in the horizontal line AG, the water will not run equally in both pipes. In order that it may, we mult difoover the diminifhed velocity with which the water now actually runs along AG, and we muft make a head DI capable of imprefling this velocity at the entry of the pipe, and then infert at I a pipe IH of the fame length with AG. The expence and velocity of both pipes will now be the fame (a).

What has now been faid of a horizontal pipe AB wuold have been equally true of any inclined pipe \(A B\), \(A^{\prime} \mathrm{B}\) (fig. 8.) Drawing the horizontal line CB , we fee that \(D C\) is the whole head or propelling preffure for either pipe AB or \(\mathrm{A}^{\prime} \mathrm{B}\); and if DE is the head neceffary for the a\{tual velocity, EC is the head neceffary for balancing the refiltances; and the pipe EF of the fame length with AB , and terminating in the fame horizontal line, will have the fome velocity; and its in-
clination being thus determined, it will have the fame velocity and expence whatever be its length.

Thus we fee that the motion in any pipe, horizontal analogy or floping, may be referred to or fubltituted fur the betwcell motion in another inclined pipe, whofe head of water, thefe pipcs above the place of entry, is that productive of the actual and rivers velocity of the water in the pife. Now, in this cafe, demonfrasthe accelerating force is equal to the refiftance: we ted by De may therefore confider this laft pipe as a river, of which the bed and the llope are uniform or conftant, and the current in a flate of permanency ; and we now may clearly draw this important conclution, that pipes and open freams, when in a fate of permanency, pericetly refemble each other in the circumftances which are the immediate caufes of this permanency. The equilibrium between the accelerating force obtains not only in general, but takes place through the whole length of the pipe or Atream, and is predicable of every individual tranfverfe fection of either. To make this more pal. pably evident if poffible, let us confider a floping cylindrical pipe, the current of which is in a flate of permanency. We can conceive it as confifting of two half cylinders, an upper and a lower. Thefe are running together at an equal pace ; and the filaments of each immediately contiguous to the feparating plane and to each other, are not rubbing on each other, nor affecting each other's motions in the fmalleft degree. It is true that the upper half is preffing on the lower, but in a direstion perpendicular to the motion, and therefore not affecting the velocity; and we fhall fee prefently, that although the lower fide of the pipe bears fomewhat more preffire than the other, the refiflances are not changed. (Indeed this odds of preflure is accompanied with a difference of motion, whicla need not be confidered at prefent; and we may fuppefe the pipe fo fmall or fo far below the furface, that this fhall be infenifie). Now let us fuppofe, that in an inftant the upper half cylinder is annihilated: We then have an open fream; andevery circumfance of accelerating force and of refiftance remains precifely as it was. The motion mult therefore continue as it did; and in this fate the only accelerating force is the flope of the furface. The demonflration therefore is complete.

From thefe obfervations and reafonings we draw a confegeneral and important conclufion, "That the fame queuce. pipe will be fufceptitle of different velocities, which it will preferve uniform to any diftance, according as it has different inclinations; and each inclination of a pipe of given diameter has a certain velocity peculiar to itfelf, which will be maintained uniform to any diftance L1 2
what-
(A) We recommend it to the reader to make this diftribution or allotment of the different portions of the preffure very familiar to his mind. It is of the moft extenfive influence in every queftion of hydraulics, and will on every occalion give him difting conceptions of the internal procedure. Obvious as the thought feems to be, it has efcaped the attention of all the wricers, on the fubject. Leechi, in his Hydraulics publifhed in 1766 , afcribes fomething like it to Daniel Bernoulli ; but Bernoulli, in the paffage quoted, ouly fpeaks of the partition of preflure in the inftant of opening an orifice. Part of it, fays he, is employed in accelerating the quiefcent water, and producing the velocity of efflux, and the remainder produces the preflure (now diminifhed) on the fides of the vefficl. Bernoulli, Boflut, and all the gond writers, make this diftribution in exprefs terms in their explanation of the motion of water through fucceffive orifices; and it is furprifing that no one before the Chevalier de Buat faw that the retiflance arifing from friction required a fimilar partition of the preflure; but though vec fhould call this good fortune, we mut alcribe to his great f.gacity and juftnefs of conception the beautiful ule that he has made of it: "fuum cuigue."

 its incituriou. or deve din! : itscotation alone.
 of ath ine

It is chin ot it at th Fimsipte is of the namell con. fequence in the ticu: y of huctradics ; for by experio mest we con li.a! n! c uain of an! pire. It is in trant whan an inctemi ct ©ngeth matazs m clange in the ve. locity, It lunativening the pipe ian ienfes the velocity, tha 11 re oi the pipe is to gic. \(t\) and sioe vire. And havins: dforsacd the tran if the pipe, and oblerved its vel city, and compued the: hasd produtive of this yeloci.y with the contracion at the entry, the remaia\(d=r\) of the lased, that \(i s, t h e\) flope ( \(t\) or this is equiv.t. lent to Lid), is the meafore of the refitance. Thus we obtain the meature of the relifance to the motion with a given volocity in a pips of given diameter. It we change only the veincity, we get the mealure of the nesv relinance relatise to the velocity; and thus difo. ver the law of relation between the relilance and velocisy. 'luen changing only the diameter of the pipe, we get the meature of the reliftance relative to the dianeitr. Hhis is the aim of a prodigi us number of experments mace and collected by Duat, and which we thanl n i repeat, but only give the refuits of the different parts of his inveltigation.

IV = may exprefo the flope of a pipe by the fymbol \(\frac{1}{4}\), 1 being an inch for infance, and s being the flant length of a pipe which is one inch more elevated at me cod than at the other. 'Thus a river which has a diccivity of an inch and a half in 120 fathoms or \(864^{\circ}\) inc..ec, has its Acpe \(=\frac{1 \frac{1}{2}}{8640}\), or \(\frac{1}{5760}\). Dut in order to obsain the hydratulic flope of a conduit pipe, the leighos of the reiervoir and place of difcharge being ziven, we mult fubtast from the difference of clevation we height or head of water nece!fary tor propelling the w...er into any pipe with the velocity \(V\), which it is firpofed atually to have. This is \(\frac{V^{2}}{505^{\circ}}\) The remain\({ }^{\prime} r d\) is \(\pm 0\) be confidered as the height of the declivity, whical is to be ditributed equally over the whole length Ios the rip \({ }^{\circ}\), and the flope is then \(\frac{d}{l}=\frac{1}{3}\).

Thizere is another important view in be taken of the dape, which the reader thould orate very familiar to his
 of the whole rnlumn whsica is in motion and the weight which is employed in overcoming the tefinance; and the reffatance to the motion of any colum of water is equal to the weight of that columin multplied by the fration \(\frac{1}{s}\), which expreffes its flope.
\(4 i\)
Of the refilances which bring the motions to a tate rif unifuramty.

Wa'er. Vihat we cail the raitnate is the dimbntion of a motion witich wall have obtained but for thelis relitlances; and the beit way we lave of meafuring them is by the force which se mult employ in order to keep up or reitore this motion. Wfe chlimate this motion by' a progreflive velocity, which we meafure by tle expence of watcr in a given time. We judge the velocity to diminifh, when the quantity difcharged diminihes; yct it may be otherwife, and probably is vherwife. The abolute velocity of many, if not all, of the particles, may even be increafed ; but many of the motions, being tranfverfs to the general direction, the quantity of \(m\) tion in this direction may be lefs, while the funs of the abfolute motions of all the particles maly be greater. When we increafe the general velocity, it is not unreafonable to fuppofe that the impultes on all the incquatites are increaled in this proportion ; and the number of particles thus impelling and deffeted at the fime time will increafe in the fame proportion. The whole quantity thercfore of thete ufelels and lof motions will increafe in the duplicate ratio of the velocities, and the loree neceffiry for keeping 1 ? the motion will du fo alfo; that is, the reflftances the uld incrafe as the fquares of the velocities.

Or if we confider the refiftances as arifing merely from the curvature of the imperceptible internal motions occafioned by the inequalities of the fides of the pipe, and :ts meatured by the forces necelfary for preducing thefe curvilineal motions; then, becaufe the curves will be the fame whatever are the velocities, tle deflecting forces will be as the fquares of the velocities ; but thefe deflecting forces are preffures, propagated from the parts urged or preffed by the external force, and are proportional to thefe external preffures by the principles of hydroltatics. Therefore the prollures or forces neceflary for keeping up the velocities are as the fquares of thefe velocities; and they are our only meafures of the refiftances which mult be confidered as following the fame ratio. Whatever view therefore we take of the nature of thefe refiflances, we are led to confider them as proportional to the fquares of the velocities.

We may therefore exprefs the refiltances by the fymbol \(\frac{\mathrm{V}^{2}}{m^{2}}\), meing fome number to be difiovered by e\%periment. Thus, in a particular pipe, the diminution of the motion or the refiltance may be the Iecoth part of the fqua:e of the velocity, and \(R=\frac{V^{2}}{1000}\).

Now if \(g\) be the accelerating power of gravity on any particle, \(\frac{g}{}\) will be its accelerating power, by which it would urge it down the pire whofe nope is \(\frac{1}{s}\). Therefore, by the principle of uniform motion, the equality of the accelcrating force, and the refifance, we thall have \(\frac{V^{2}}{m}=\frac{g}{s}\), and \(V \sqrt{ } s=\sqrt{ } \overline{m g}\); that is, the prodnct of the velocity, and the reciprocal of the fquyre root of the ीope, or the quotient of the velocity divided by the flope, is a comant quantity \(\sqrt{m g}\) for any given pipe; and the primary formul, for all the uniform velocities of onc pipe is \(V=\frac{\sqrt{m s}}{\sqrt{s}}\).

Mr Buat therefore examined this by experiment, but found, that even with refpect to a pipe or channel which was uni orm thrughout, this was not true. We cuald give at once the final formula which be found to exprefs the velocity in every cafe whatever; but this vould be too empirical. The chiet fleps of his very fagacious invelligation are initructive. We thal therefore mention them brietly, at leaft as f.ir as they tend to give us any col'ateral information ; and let it dhays be noted, that the in!lruction which they convey is not abitr et lpeculation, but experimental truths, which mult ever remai: as an addition to our tock of knowledge, alth ugh Mr Buat's dedutions from them thould prove talle.

He found, in the firt place, that in the fame channol the proluct of \(V\) and \(\sqrt{s}\) iccrested as \(\sqrt{ }\) s increafed; that is, the velocities increafed falter than the fyuare roots of the flope, or the reliflances did not increate as faft as the iquares of the velocities. We beg leive t. refer our readers to whit we fad on the retith ance \(f\) pipes to the \(m\) tion of fuids through them, in the articl Pneumanics, when feaking of bellows. They will here fee very vilud reafons (we apprehend) for thiaking that the refitances mult increate more flowly than the lquares of the veloci ies.

It being fiume, then that \(V \sqrt{s}\) is not equal to a conkant quintity \(\sqrt{m g}\), it bicomes neceflary to invefig ite fome quanticy depenzing on \(\sqrt{s}\), or, as it is called, fome function of \(\sqrt{3}\), which thill render \(\sqrt{m g}\) a conftani quantity. Let X be this function of \(\sqrt{ }{ }^{-}\), fo that we hall always have VXequal to the conflant quanti:y \(\sqrt{m g}\), or \(\frac{\sqrt{m g}}{\dot{X}}\) equal to the actual velocity V of a pipe or channel which is in train.

Mr Buat, after many trial, and retlecticns, the chief of which will be mentinned by and by, found a value of X which correfp inded with a valt variety of flopes and velocitie, from motions almoft imperceptible, in a hed nearly horizontal, to the greateit velocities which could be produced by gravity alone in a vertical pipe; and when he compared them \(t\) gether, he \(f\) und a very difeernible relati \(n\) between the refittances and the magnitude of the fection: that is, that in two chanaels which had the fame flope, and the fame propeling force, the velocity was greateft in the channel which had the greatert fection relative to its border. This maly reafonably be expened. The retiflances arife from the muiual action of the water and this \(b\) reder. The water immediately contigunns to it is retarded, and this retards the next, and fo on. It is to be expected, therefore, that if th: border, and the velocity, and the flope, be the fame, the diminu ion of this velocity will be fo much the lets as it is to be fhared among a greater number of partic'es; that is, as the area of the lestion is greater in proportion to the extent of its bnrder. The diminution or the general or medium ve locity muft be lefs in a cylindrical pipe than in a fiquue one of the fame area, becaufe the burder of its fection is lefs.

It appears evident, that the refiffance of each particle is in the direft proportion of the whole refitance, and the inverfe proportion of the number of partiele, wh ch receive equal thares of it. It is therefore directly as the
borcer, and inverfely as the fection. Therefore in the expretion \(\frac{V^{2}}{n}\) which we have given for the refitaace, the quantity \(n\) cannot be conflant, except in the fame channel; and in different channels it muft vary along with the relation of the fection to its border, becaute the relifances diminilh in proportion as this relation increafes.

Without attempting to difeover this relation by theo. retical examination of the particular motions of the various filaments. Mir huat endeavoured to difcover it by a comparilk \(n\) of experimerts. But this required fome manner of Atating this proportion between the augmentation of the fection and the augmentation of its border.

His fta ement is thas: He reduces every fection to a rectangular parallelogram of the fame area, and having its bate equal to the border unf lied into a Atraight line. The product of this bafe by the height of the rectangle will be equal to the area of the fection. Therefore this height will be a reprefentative of this vaiable ratio of the fection to \(i\) :s border. (We do not mean that there is any ratio between a surtace and a li e: but the ratio of feation to fection is different from that of border to border; and it is the ratio of th: e ratios which i, thus expreffed by the heiglt of 'his re \(\mathcal{F}\) a.igle). If \(S\) be t.ie fection, and \(B\) the border, \(\frac{\mathrm{S}}{\mathrm{B}}\) is evidently a line equal to the height of this rectangle. Every fection being in this manner reduced to a rectangle, the perpendicular herght of it may be called the hydraulic mean depth of the feation, and may be expreffed by the fymbol \(d\). Buat calls it the mean radius). If the channel be a cylindrical pipe, or an open half cylinder, it is evident that \(d\) is half the radius. If the fection is a rectangle, whofe widrh is \(w\), and height \(b\), the mean depth is \(\frac{\text { wol }}{b+2 b}\), \&c. In general, if \(q\) reprefent the proportion of the breadth of a rectangular canal to its depth, that is, if \(q\) be made \(=\frac{w}{b}\), we fhall have \(d=\frac{w}{q+2}\), or \(d=\frac{q b}{q+2}\).

Now, fince the refinan es muft augment as the proportion of the border to the fection augments, \(m\) in the formulas \(\frac{\mathrm{V}^{2}}{m}=\frac{g}{s}\) and \(\mathrm{V} \sqrt{ } s=\sqrt{m_{s}}\), mult follow the proportions of \(d\), and the quantity \(\sqrt{m g}\) mult be proportional to \(\sqrt{ } d\) for diferent channels, and \(\frac{\sqrt{m g}}{\sqrt{d}}\) fhould be a conftant quartity in every cafe.

Cur authol was aware, linwever, of a very fpecious objection ti) the clofe dependence of the retiftace o \(A\) fpecious tie extent of the border; and that it might be faidobeation. that a dul? her faid ance dind hord. For, mins the preffure on all the parts was the fame. For to may he naturally ( nd it is generally) luppofed, that the refiftance will be greater when the preffure is greater. The friction or refiftance analngous to friction may th refo e be greater on an inch, of the bnttem than on an inch of the fides; but Mr D'A'embert and many others have \(d\) monftrated, that the paths of the filaments will be the fame whatevcr be the preffures.

Theorv.

This might ferse to juftify our ingenious author ; but he was deternined to reflevery thing on experiment. He therefore made an experiment on the oicillatio of water in fyphons, which we have repeated in the following form, which is affeated by thic fame circum. Itances, and is lufceptible of much greater precilion, and of more extenfive and important application.

The two velfe's ABCD, aitd (fig. 9.) were connetted by the fyphon EFG \(f f e\), which turned round in the Chort tubes \(\dot{\text { E }}\) and \(e\), without allowing any water to efcape; the axes of thefe tubes being in one ftraight line. The velfels were about 10 inches deep, and the branches FG, \(f g\) of the fyphon were about five feet long. The vellels were fet on two tables of equal leight, and (the bole \(e\) being llopped) the veffel \(A \mathrm{BCD}\), and the whole fyphon, were filled with water, and water was poured into the veffel \(a b c\) al till it ftond at a certain beizht LM. The fyphon was then turned into a horizontal pofition, and the plug drawn out of e, and the time carefully noted which the water employed in rifing to the level \(\mathrm{HK} k b\) in both velfels. The whole apparatus was now inclined, fo that the water run back into ABCD . The fyphon was now put in a vertical pofition, and the experiment was repeated. -No fenfible or regular difference was obferved in the time. Yet in this cxperiment the preflure on the part G \(g\) of the fyphon was more than fix times greater than belore. As it was thought that the friction on this fmall part (only fix inches) was too fmall a portion of the whole obftruction, various additional obftructions were put into this part of the fyphon, and it was even lengtbened to nine feet; but fill no remarkable difference was obferved. It was even thought that the st times were lefs when the fyphon was vertical.

Thus Mr De Buat's ofinion is completely juftified ; perndschief-pends chiefly on the relation between the feetion and ly on tic
relation te- its border and that \(\frac{\sqrt{m g}}{\sqrt{d}}\) theen the
freuld be a conftant quandity.
its brder. To
To afcertain this point was the object of the next feries of experiments; to fee whether this quantity was really conftant, and, if not, to difeover the law of its variation, and the phyfical circumftances which accompanied the variations, and may therefore be confidered as their caufes. A careful comparifon of a very great number of experiments, made with the fame flope, and with very different channels and velocities, fhowed that \(\sqrt{m g}\) did not follow the proportion of \(\sqrt{d}\), nor of any power of \(\sqrt{d}\). This quantity \(\sqrt{m g}\) increafed by fmaller degrees in proportion as \(\sqrt{d}\) was greater. In very great beds \(\sqrt{m g}\) was nearly proportional to \(\sqrt{d}\), but in fmaller channels, the velocities diminifhed much more than \(\sqrt{d}\) did. Cafting about for fome way of accommodation, Mr Buat confidered, that fome approximation at leaft would be had by taking off from \(\sqrt{d}\) fome contant finall quantity. This is evident: For fuch a diminotion will have but a trifing offed when \(\sqrt[{\sqrt{d}}]{d}\) is great, and its effect will incıeale rapidly when \(\sqrt{d}\) is very fmall. He therefore tried various values for this fubtrastion, and eompared the refults with the former experiments ; and he found, that if in
every cafe \(\sqrt{d}\) be diminifhed by ene.tenth of an inch, the calculated difcharges would agree very exactly with the experiment. 'Therefore, inftead of \(\sqrt{d}\), he makes ufe of \(\sqrt{d}-0,1\), and finds this quantity always pro. portional to \(\sqrt{m g}\), or finds that \(\frac{\sqrt{m g}}{\sqrt{1}-0,1}\) is a conflant quantity, or very nearly fo. It varied from 297 to 287 in all fections from that of a very fmall pipe to that of a little canal. In the large fections of canals and rivers it diminifhed fill more, but never was lets than 256.

This refult is very agreeable to the moft diftinet no- The refule tions that we can form of the mutual adtions of the agreeable water and its bed. We fee, that when the motion of to our diwater is obfructed by a folid body, which deflects the fincith nrpaffing filament, the difturbance does not extend to any confiderable diftance on the two fides of the hody. In like manner, the fmall dithurbances, and imperceptible curvilineal motions, which are occalioned by the infinitefimal inequalities of the channel, muft extend to a very fmall diftance indeed from the lides and bottom of the channel. We know, too, that the mutual adhefion or attraction of water for the folic bodies which are moiftened ly it, extends to a wery fmall diftance ; which is probably the fame, or nearly fo, in all cafes. Mr Buat obferved, that a furface of 23 fquare inches, applied to the furface of flagnant water, lifted 1601 grains; another of \(5 \frac{1}{3}\) fquare inches lifted 365 : his was at the rate of 65 graino per inch nearly, making a column of about one fixth of an inch high. Now this effect is very much analagous to a real contraction of the capacity of the channel. The water may be conceived as nearly ftagnant to this fmall diffance from the horder of the fection. Or, to fpeak more accurately, the diminution of the progreffive velocity occationed by the fiastion and adhefion of the fides, decreafes very rapidly as we recede from the fides, and ceafes to be fenfible at a very fmall diftance.

The writer of this article verified this by a very fimple and conand infructive experiment. He was making experiments firmed by on the production of vortices, in the manner fuggelted by experiSir Ifaac Newton, by whirling a veryaccurate andfmooth- mert. ly polithed cylinder in water; and he found that the rapid motion of the furrounding water was confined to an exceeding fmall diftance from the cylinder, and it was not till after many revolutions that it was fenfible even at the diftanre of half an inch. We may, by the way, fuggeft this as the befl form of experiments for examining the refiftances of pipes. The motion excited by the whirling cylinder in the flagnant water is equal and oppofite to the motion lof by water paffing alcng a furface equal to that of the cylinder with the fame velo. city. Be this as it may, we are jullificd in confidering, with Mr Buat, the fection of the flream as thus diminifhed by cutting off a narrow border all round the touching parts, and fuppoling that the motion and difcharge is the fame as if the root of the mean depth of the fection were diminifhed by a fmall quantity, nearly conftant. We fee, too, that the effect of this mult be infenfible in great canals and rivers; fo that, fortunately, its quantity is beft afcertained by experiments made with fnall pipes. This is attended with another conveniency, in the opinion of Mr luat, namely, that the
effect

effect of vifcidity is mott fenfible in great maffes of water in flow motion, and is almof infenfible in fmall pipes, fo as not to difturb thefe experiments. We may herefore affum: 207 as the general value of \(\frac{\sqrt{n g}}{\sqrt{d}-0,1}\)

Since we have \(\frac{\sqrt{m g}}{\sqrt{d-0,1}}=297\), we have alfo \(n t=\frac{\frac{297}{2}^{2}}{\sqrt{\hat{b}^{1}-\mathrm{C}, \mathrm{I}^{2}}}=\frac{88209}{362}(\sqrt{d}-0,1)^{2},=\) \(243,7(\sqrt{d}-0,1)^{3}\). This we may exprefs by \(n(\sqrt{d}-0,1)^{2}\). And thus, when we have expreffed the effect of friction by \(\frac{\mathrm{V}^{2}}{m}\), the quantity \(m\) is variable, and its general value is \(\frac{\mathrm{V}^{2}}{\left.n(\sqrt{d}-0,1)^{2}\right)}\) in which \(\theta\) is an invariable abftract number equal to 243,7 given by the nature of the refitance which water fultains from its hed, and which indicates its intenfiry.

And, latil), fince \(m=n(\sqrt{d}-0, r)^{2}\), we have \(\sqrt{\overline{m g}}=\sqrt{n g}(\sqrt{d}-0,1)\), and the expreffion of the velocity V , which water acquires and maintains along any channel whatever, now becomes \(\mathrm{V}=\) \(\frac{\sqrt{n g} \sqrt{d}-0,1)}{\bar{X}}\), or \(\frac{297(\sqrt{d}-0,1)}{\mathrm{X}}\), in which X is alfin a variable quantity, depending on the flope of the furface or channel, and exprefing the accelerating force which, in the cate of water in train, is in equilibrio w.th the refiltances exprefled by the numerator of the fraction.
Lativ of acceleration inveftigaled.

Having fo happily fucceeded in afcertaining the variations of refitance, let us accompany Mr Buat in his invelligation of the law of acceleration, exprefled by the value of X .

Experience, in perfect agreement with any diftinct opinions that we can form on this fardject, had arready fhowed him, that the refitinces increafed in a flower ratio than that of the fquates of the velscitie, or that the velocities increafed flower than \(\sqrt{3}\). Therefore, in the formula \(\mathrm{V}=\frac{\sqrt{\overline{n g}}(\sqrt{ } d-0,1)}{\mathrm{X}}\), which, frrone channel, we may exprefs thus, \(V=\frac{A}{\bar{X}}\), we mutt admit that X is fenfibly equal to \(\sqrt{s}\) when the flope is very fmall or s very glea!. But, that we may accurately exprefs the velocity in priportion ats the flope augments, we muft have \(X\) greater than \(\sqrt{\bar{s}}\); and more ver, \(\frac{\sqrt{s}}{\mathbf{X}}\) muft increafe as \(\sqrt{s}_{s}^{-}\)diminiftes. Thefe conditions are neceffary, that our values of V , deduced from the formula \(V=\frac{A}{X}\), may agree with the experiment.

In order to compreliend every degree of \(\mathrm{n} \cdot \mathrm{pe}\), we mult particularly d tend to he motion thr ugh pipes, becaufe "pen canals will \(n\) t furnith us with infances of exact trans with great nlpos and velichies. We can make pipes verticat. In this cafe \(\frac{1}{5}\) is \(\frac{1}{1}\), and the velocity is the greatelt poffible for a train by the action of gravity: But we can give greater velocities chan this
by increafing the head of water bejond what produces the velocity of the train.

Let AB (fig. 10.) be a vertical tube, and let CA be the head competent to the veiocity in the tube, which we fuppofe to be in train. The תope is I , and the full weight of the column in motion is the precife meafure of the refiftance. The value of \(\frac{t}{s}\), confidered as a flope, is now a maxinum; but, confidered as exp:elling the proportion of the weight of the column in motion to the weight which is in equilibrio with the refiftance, it may not be a maxinum ; it may furpafs unity, and s may be lefs than I For if the velfel be filled to \(E\), the head of water is incieafed, and will produce a g:eater velocity, and this will produce a greater refilfance. The velocity being now greater, the head EF which imparts it mult be greater than CA. But it will not be equal to EA, becaufe the uniform velocities are found to increafe fafter than the iq are routs of the preffures. This is the general fact. Therefore F is above A , and the weight of the column FB, now employed to overcome the refiltance, is greater than the weight of the column \(A B\) in motion. In fuch cafes, therefi re, \(\frac{1}{s}\), greater than unity, is a fort of fictitious nope, and only reprefents the proportion of the refillance to the weight of the moving column. This proportion may dur pafs unity.

But it cannot be infinite: for fuppofing the head of water infinite; if this priduce a finite velocity, and we deduct from the whole height the height correfponding to this finite velocity, there will remain an infiniee head, the mealure of an infinite refifance produced by a finite velocity. This does not accord with the obferved law of the velocities, where the refiftances actually do not increafe as faft as the fquares of the velocities. Therefore an infinite head would have produced an infinite velocity, in oppofition to the refiftances: taking of the liead of the tube, competent to this velocity, at the entry of the tube, which head would alfo be infinite, the remainder would in all probability be fini e, balancing a fitite refiftance.

Therefure the va ue of may remain finite, although the velocity be infinite; and this is agreeable to all our clearelt notions of the refiftances.

Adnpting this \(p\) inciple, we muft find a valne of \(X\) which will anfwer all thele conditions. 2. It muft be fenfibly proportional in \(\sqrt{ } s\), while \(s\) is great. It mult always be lef than \(\sqrt{3} . \quad 3\). It muft deviate from the proportion of \(\sqrt{s}\), fo much the more as \(\sqrt{s}\) is fmaller. 4. It mult nut varifh when the velocity is infinite. 5. It mult agree with a range of experiments with every variet y of ch innel ind of flope.

We lh.1ll underland the nature of this quantity X better by teprefenting by lines the quan.ities concerned in forming it.

If the veloci ies were exaclly as the fquare ronts of the flo, e, the equiitteral hyperb la NKS (ig. 10. \(n^{0}\) 2) between its affymptotes MA, AB, would reprefent the equation \(V=\frac{A}{\sqrt{s}}\). The values of \(\sqrt{s}\) would be reprefented by the abiciffe, and the vel cities by the ntdinate, a:d \(V \sqrt{ } s=A\) would be the power of the hyperbula. But fince thefe velocities are not fonlibly equal
\(\underbrace{\text { Treors. }}\) equal to \(\frac{A}{\sqrt{ }}\) except when \(\sqrt{5}\) is very great, and deviate the more from this quantity as \(\sqrt{5}\) is fimaller; we may reprefint the velucities by the ordinates of another curve l'c't, which approaches very near to the hyperbola, at a great dinance fr m \(A\) along \(A B\); but ieparates from it when the abicilite are finaller: fo that if AQ reprefents thit value of 's (which we have feen may tecome lefs than unity), which corrcfponds to an intiaite velocity, the line QO may be the allymptote of the new curve. Its ordinates are equal to \(\frac{A}{X}\) while thofe of the hyperbola are equal to \(\frac{A}{\sqrt{\prime}}\). Therefore the ratio of thefe ordinates or \(\frac{\sqrt{ } / \mathrm{s}}{\mathrm{X}}\) hiould be fuch that it fhall be fo much nearer to unity as \(\sqrt{s}\) is greater, and fhall furpais's it fo much the more as \(\sqrt{ } s\) is fmaller.

To expreis X therefore as fome function of \(1 / \mathrm{s}\) fo as to anfiver thefe conditions, we fee in general that \(X\) mult be lefs than \(\sqrt{ } s\). And it mult not be equal to any power of \(\sqrt{ } s\) whofe index is lefs than unity, becaufe then \(\frac{\sqrt{ } s}{\mathrm{X}}\) would differ fo much the more from unity as \(\sqrt{\prime}\) is greater. Nor mult it be any multiple of \(\sqrt{ } s\) fuch as \(q \sqrt{ }\) s, for the fame reafon. If we make \(X=\sqrt{ } s-K, K\) being a confant quantity, we may anfwer the firft condition pretty well. But l mult be very fmall, that X may not become equal to rothing, except in fome exceedingly fmall value of \(\sqrt{ } s\). Now the cxperiments will not admit of this, becaule the ratio \(\frac{\sqrt{ } s}{\sqrt{ }-l l}\) does not increafe fufficiently to correfpond with the velocities which we obferve in certain flopes, unlefs we make \(K\) greater than unity, which again is inconliftent with other experinients. We learn from fuch canvaffing that it will not do to make K a conftant quantity. If we floould make it any fractionary power of \(\sqrt{ } s\), it would make \(\mathbb{X}=0\), that is, nothing, when \(s\) is \(=1\), which is alfo contrary to esperience. It would feem, therefore, that nothing will infwer for K but fome power of \(\sqrt{ } s\) which has a rariable index. The logarithm of \(\sqrt{s}\) has this property. We may therefore try to make \(X=\sqrt{ }\) s-log. \(\sqrt{ } \mathrm{s}\). According if we try the equation \(V=\frac{A}{\sqrt{s}-\operatorname{lyp} p . \log \cdot \sqrt{s}}\), we fhall find a very great agreement with the experiments till the declivity becomes contiderable, or about \(\frac{1}{2}\), which is much greaser that any river. But it will not agree with the ve ocitic. obferved in fome mill courfes, and in pipes of at fill greater declivity, and gives a velocity diat is ton fmali ; and in vertical pipes the velocity is mer above nue hati of the truc one. We fhall get rid of mot of thefe inongraitios if we make \(K\) confift of the hyperbolic logarithm of \(\sqrt{s}\) augmented by a fmall conftent quantity, and by trying various values for this conllant quantity, and comparing the refults with expariment, we maly hit on one futheicntly exact for all practical purpofes.

Mr De Buat, after repeated trials, found that he would have a very great conformity with experiment
by making \(K=\log . \sqrt{s+1}, \overline{6}\), and that the velocitiss exhibited in his experiments would be very well reprefented by the formula \(\mathrm{V}=\frac{297\left(\sqrt{2}-\frac{0,1}{\sqrt{3}-L \sqrt{s+1,6}} \text {. }\right.}{\text {. }}\)

55
There is a circumfance which our author feems to Mutualadhave overlooked on this occafion, and which is und oubtr hefion of edly of great effect in thefe motions, viz. the mutual the paradhefion of the particles of water. This canfes the wates of water which is defeending (in at vertical pipe for example) to drag more watcr after it, and thus greatly increafes its velocity. We have feen an experiment in which the water iffued from the bottom of a refervoir threugh a long vertical pipe having a very gentle taper. It was is feet long, one inch diameter at the upper ond, and two inches at the lower. The depth of the water in the refervoir was exafly one foot; in a minute the:e were difcharged 2 ? \({ }^{2}\) cubic feet of water. It mult therefore have iffued through the linle in the bottom of the refervoir with the velocity of 8,85 feet per fecond. And yet we know that this head of water could not make it pafs through the hole with a velocity greater than 6,56 feet per fecond. This increafe muft therefore have arifen from the caufe we have mentioned, and is a proof of the great intenfity of this force. We donbt not but that the difcharge might have been much more increafed by proper contrivances; and we know many infances in water pipes where this cffect is produced in a very great degrec.

The following cafe is very diftinet : water is brought an astual into the town of Dunbar in the county of Eaft Lothian cafe, in from a fpring at the ditance of about 3200 yards. It scotland is conveyed along the firt 1100 yards in a pipe of two inclies diameter, and the declivity is 12 feet nine inches; from thence the water flows in a pipe of \(1 \frac{t}{2}\) diameter, with a declivity of \(4+\) feet 3 inches, making in all 57 feet. When the work was carried as far as the two-inch pipe reached, the difcharge was found to be 27 Scotch pints, of \(103 \frac{1}{2}\) cubic incles each in a minute. When it was brought into the town, the difcharge was 28 . Here it is plain that the defent along the fecond Itretch of the pipe could derive no impulfion from the firt. This was only able to fupply 27 pints, and to deliver it into a pipe of equal bore. It was not equivalent to the forcing it into a fmaller pipe, and almoft doubling its velocity. It muft thercfore have been dragged into this fmaller pipe by the weight of what was defcending alongit, and this water was exerting a force equivalent to a head of 16 incles, increafing the velocity from \(1+\) to about 28 :

It mult be olfierved, that if this formula be juft, proves shat there can be no declivity fo fmall that a current of wa- the fraalleit ter will not take place in it. And accordingly none declivity has been obferved in the furface of a fream when this will prodid not lappen. But it alfo hould happen with re duce a curfpest to any declivity of botom. Yet we know that rent. water will hang on the floping furface of a board without proceeding further. The caufe of this feems to be the adhefinn of the water combincd with its vifuidity The vifcidity of a fluid prefents at estain force which mult be overome before any current can take place.

A feries of important experiments were made by our author in order to afcertain the relation between the velocity at the furface of any fream and that at the

\section*{Part I.}
the bottom. Thefe are curious and valuable on many accounts. One circumftance deferves our notice here, viz. that the difference betzeen the fuperficial and b:lloms velocilies of any fream are froportional to the Square rosis of the תuperficial velccities. From what has been already 1aid on the gradual diminution of the velocitics annong the adjoining filaments, we muft conclude that the fame rule holds good with refpeet to the velocity of feparation of two filaments immediately adjoining. Hence we learn that this velocity of feparation is in all cales indefinitely finsll, and that we may, withont danger of any fenfible error, fuppole it a conftant quantity in all cales.
A coultant We think, with our ingenions author, that on a part of the revicw of thefe circumftances, there is a conitant or in-aecelerating force employed in overconving the vifcidity, \&c. variable portion of the acceleratiag force emplojed in orerconing this vifcidity and producing this mutual feparation of the adjoining filiments. We may exprefs this part of the accelerating force by a part \(\frac{1}{5}\) of that flope which confitutes the whole of it. If it were not employed in overcoming this refiftance, it would produce a velocity which (on account of this refiftance) is not produced, or is lof. This would be \(\frac{\text { A }}{\sqrt{S}-L \sqrt{S} \text {. }}\) This mult therefore be taken from the velocity exhibited by our general formula. When thus corrected, it would become \(\mathrm{V}=(\sqrt{\bar{d}}-0,1)\left(\frac{\sqrt{n g}}{\sqrt{s-\mathrm{L} \sqrt{s+1,6}}}\right.\) \(\left.-\frac{\sqrt{n g}}{\sqrt{S}-\mathrm{L} \sqrt{ } \mathrm{S}}\right)\). But as the term \(\frac{\sqrt{n g}}{\sqrt{S}-\mathrm{L} \sqrt{ } \mathrm{S}}\) is compounded only of confant quantities, we may exprefs it by a fingle number. This has been collected from a fcrupulous attention to the experiments (efpecially in canals and great bodies of water moving with very fmall velocities; in which cafe the effects of vifcidity muft become more remarkable ), and it appears that it may be valued at \(\sqrt{0,09}\), or \(c, 3\) inches very nearly.

From the whole of the foregoing conliderations, drawn from nature, fupported by fuch reafoning as our moft diftinet notions of the internal motions will admit, and authorifed by a very extenfive comparion with experiment, we are now in a condition to conclude a complete formula, expreffive of the uniform motion of water, and involving every circumfance which appears to have any fare in the operation.

Therefore lct
\(V\) reprefent the mean velocity, in inches per fecond, che uniforna is in trues in water, runnis, uminnel, wr which mution of tion, figure, and llope, are conftant, but its length water. indefinite.
\({ }^{\prime}\) the hydraulic mean depth, that is, the quotient ariting from dividing the festion of the channel, in fquare inches, by its border, exprefled in linear inches.
\(s\) The flope of the pipe, or of the furface of the current. It is the denominator of the fraction expreffing this flope, the numerator being always unity; and is had by dividing the expanded length of the pipe or channel by the diference of height of its two extremities.

Vol. XVI.
E. R.
\({ }_{5}\) The velocity (ia inches per fecond) which a heavy Theory. Lody acquires by talling during oue feconc!.
\(n\) An abftrat coultant number, detcrmined by experiment to be 243,7.
L. the hyperbolic logarithm of the quantity to which it is prefixed, and is had by muluplying the common lo. garithm of that quantity by 2,3026 .

We fhall have in every inftarice
\[
\mathrm{V}=\frac{\sqrt{n}}{\sqrt{n}}-(\sqrt{d}-0,1)
\]

This, in numbers, and Englifi meafure, is
\(\mathrm{V}=\frac{307(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \sqrt{s+1,6}}-0,3(\sqrt{d}-0,1)\)
And in French meafure
\[
\mathrm{V}=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \sqrt{s+1,6}}-0,3 \quad(\sqrt{d}-0,1)
\]

The following table contains the real experiments from which this formula was deduced, and the compariion of the real velocities with the velocities computed by the formula. It confifts of two principal fets of experiments. The firlt are thofe made on the motion of water in pipes. The fecond are experiments made on open canals and rivers. In the firt fet, column it contains the number of the experiments; 2 d , the length of the tube; \(3^{d}\), the height of the refervoir ; \(4^{\text {th }}\), the values of S , deduced from column fecond and third; 5th gives the obferved velocities; and 6th the velocities calculated ty the formula.

In the fecond fet, column 2 d gives the area of the feation of the channel; 3d, the border of the canal or circumference of the fection, deducting the horizontal width, which fultains no friftion; 4th, the fquare root \(\sqrt{d}\) of the hydraulic mean depth ; sth, the denominator \(S\) of the flope; 6th, the obferved mean velocities; and 7 th, the mean velocities by the formula. In the laft ten experiments on large canals and a natural river the 6 th column gives the obferved velocities at the furface.

This comparifon mut be acknowledged to be mot futisfactory, and thows the great penetration and addreis of the author, in fo fuccefffully fifting and ap. preciating the fhate which each co-perating ci.cumflance has had in producing the very intric ste and complicated effect. It adds tome weight to the principles on which he has proceeded in this analyfis of the meclanifm of hydraulic motion, and mult give us great confidence in :a theory fo fairly eftablifhed on a very co- The theory pious induction. The author offers it only as a ratio- a wellnal and well-founded probability. To this charaser it founded is certainly intitlcd; for the fuppofitions made in it probability are agreeable to the moll diffinct notions we can form of thefe internal motions. And it mult always be remembered that the invelligation of the formula, although it be rendered fomewhat more perfpicuous by thus having recourfe to thofe notions, has no dependence on the truth of the principles. For it is, in fact, nothing but a claffification of experiments, which are grouped together by forne one circumftance of llope, veiocity, form of fection, \&cc. in order to difoover the law of the changes which are induced by a variation of the circumftances which do not refemble. The procedure was precifely fimilar to that of the aftronomer when he deduces the elements of an orbit from a multitude of olfervations. This was the tafk of Mr de Buat and he candidl \(\zeta\) and modefly informs us, that the finding out analytical forms of exprefion which would exhibit thefe changes was the work of Mr Benezech de St Honoré, a young officer of engineers, and his colleague in the experimental courfe. It does honour to his fkill and addrefs; and we think the whole both a pretty and inltructive fpecimen of the method of difcovering the laws of nature in the midt of complicated phenomena. Daniel Bernoulli firft gave the rules of this method, and they have been greatly improved by Lambert, Condorcet, and De la Grange. Mr Coulomb has given fome excellent examples of their application to the difeovery of the laws of friction, of magnetical and electrical attraction, \&c. Put this prefent work is the molt perficuous and familiar of them all. It is the empirical method of generalifing natural phenomena, and of deducing general rules, of which we can give no other demonitration but that they are faithful reprefentations of matters of fact. We hope that others, encouraged by the fuccefs of Mr de Buat, will follow this example, where public utility is preferred to a difplay of mathematical knowledge

Althoagh the author may not have hit upon the precife modus operandi, we agree with him in thinking that nature feems to act in a way not unlike what is here fuppofed. At any rate, the range of experiments The cxpeis fo extenfive, and fo multifarious, that few cafes can rinients occur which are not included among them. The ex - highly vaperiments will always retain their value (as we prefume that they are faithfully narrated), whatever may become of the theory; and we are confident that the formula will give an anfiwer to any quettion to which it may be applicable infiniely preferable to the vague guefs' of the molt fagacious and experienced enginser.

We muft however obferve, that as the experiments on pipes werc all made with ferupulous care in the contrivance and execution of the apparatus, excepting only thofe of Mr Couple on the main pipes at Verfailles, Mm2
\(\underbrace{\text { Theor: }}\) The veleci ty riven by ihe formula cou large fur urdina5y works.

We may prefume thot the formula gives the greateft veloci:1e, which ean be expeeted. In ordinary works, where joints ane rong le orleaky, where drops of fulder hang in the infide, where coch, intervere with defio cient water-way, where pipes lave auk nard bendings, controtions, or eal irgements, and where they may contain fand or air, we flould reckon on a fimaller velocity than what e:ults from cur calculation ; and we prefune that an undentaker may with contidence promife \(\frac{4}{3}\) of this quantity without any tik of difapponting his em. ployer. We imasine that the aldual periomance of canals will be much nearer to the formula.

We have m.de ingniry atter works of this kind executed in Britain, that we might comp.re them with the furnuhh. But all our canals are locked and wi:hout mosion; and we have only learned by an accidental information from Mr Watt, that atconal in his neighbourhood, which is 18 feet wide at the furface, and leven feet at the bottom, and four feet deep, and has a tlope of one inch in a quarter of a mile, runs with the velocity of 17 inches per fecond at the furface, 10 at the bottom, and 14 in the middle. If we compute the motion of this canal by our formula, we flall find the mean velocity to be \(133^{\circ}\).

No river in the world has had its motions fo much ferutinifed as the Po about the end of the latt century. It had been a fubject of 100 years continual litigation between the inhabitants of the Bolognefe and the Ferrarefe, whether the waters of the Rheno fhould be thrown into the Tronco de Venezia or Po Grande. This occafioned very numerous meafures to be taken of its fections and declivity, and the quantities of water which it contained in its different flates of fullnefs. But, unfortunately, the long eftablifhed methods of sneafuring waters, which were in force in Lombardy, made no account of the velocity, and not all the intreaties of Caftelli, Grandi, and other moderns, could prevail on the vifitors in this procefs to deviate from the cftablifhed methods. We have therefore no minute accounts of its velocity, though there are many rough eflimates to be met with in that valuahle collection publithed at Florence in 1723 , of the vritings on the motion of :ivers. From them we have extracied the only precife cbjervations which are to be found in the whole work.

The Po Grande receives no river from Stellata to the fea, and its flope in that interval is found moft furprifingly uniform, namely fix inches in the mile (reduced to linglifh meafure). The breadth in its great ficthes is 759 feet at Lagn Scuro, with a very unitorm depth of 31 fect. In its lowelt ftate (in which it is called I'o Magra), its breadth is not lefs than 700, and its depih about \(10 \frac{1}{2}\).

The Rheno has a uniform declivity from the Ponte Emilio to Vigatano of is inches per mile. Its breadth in its greatelt frethes is 189 feet, and its depth 9 .

Signor Corrade in his report fiys, that in the fate of the great frethes the velocity of the Rheno is mot exadly \(\frac{4}{5}\) of that of the Po.

Grand: fays that a great frefh in the Rheno employs 12 hours (by many obfervations of his own) to come from Ponte Emilio to Vigarano, which is 30 miles. This is a velocity of 44 inches per fecond. And, by Corrade's prop rtion, the velocity of the Po Grande mult be 55 inclies per fecond.

Montanari's obfervation gives the Po Magra a velocity of 31 inches per fecond.
1.er us compare thefe velocities with the relocit:es calculated by Buat's fermula.

The hydraulic mean depths \(d\) and \(D\) of the Rheno and \(1^{2} 0\) in the great frethes deduced from the above meafmes, are \(9^{5,6}\) and \(3 t+\) inches; and their flupes \(s\) and \(S\) are ₹'s. and rotso. 'lhis will give

and \(\frac{307}{\sqrt{s}-1 \cdot \sqrt{s}+1,6}-0,3(\sqrt{d}-0,1)=46,727\)
inches.
Thefe reflles differ very little from the velecities abovementioncd. And if the velocity correfponding to a deptis of 3 I feet be deduced from that oblerved hy Montanari in the Po Mayra 10 feet decp, on the fuppofition that they are in the proportion of \(\sqrt{ } \bar{d}\), it will be found to he about \(53 \frac{1}{2}\) inches per fecond.

This comparifon is thetefore hirhily to the credit of \(H\) Gs the theory, and would have becu very agreeable to the credit M. de lluat, had he known it, as we hope it is to our of the thereaders.

We have collceted many accounts of water pipes, and made the comparifons, and we flatter ourfelves that thefe lave enabled us to improve the theory. They fhall appear in their proper place; and we may jult obferve here, that the two-inch pipe, which we furmerly fpoke of as conveying the water to Dumbar, fh uld have yielded only \(25^{\frac{2}{3}}\) Scotch pints per minute by the formula, infead of 27 ; a fmall error.

We have, therefore, no hefitation in faying that this fingle formula of the uniform motion of water is one of the molt valuable prefents which natural fcience and the arts lave received during the courfe of this century.

We hoped to have made this fortunate invelligation of the chevalier de Buat itill more acceptable to our readers by another table, which flould contain the values of \(\frac{307}{\sqrt{s}-1-\sqrt{s+1,6}}\) ready calculated for every declivity that can occur in water pipes, canals, or rivers. Aided by this, which fuperfedes the only dufficult part of the computation, a perfon could calculate the velocity for any propofed cafe in lefs than two minutes. But we have not been able to get it ready for its appearance in this article, but we thall not fail to give it when we refume the fubject in the article \(W_{A T E R}-\) Works; and we hope even to give its refults on a fcale which may be carried in the pocket, and will enable the unlearned practitioner to folve any queltion with accuracy in half a mimute.

We have now eftablifhed in fome meafure a Theory of fyuraulics, by exhibiting a general theorem which expreffes the relation of the chicf circunaltances of all fuch motions as have attained a flate of perma. nency, in fo far as this depends on the magnitude, form, and flope of the channel. This permanency we have expreffed by the term Train, fiying that the tream is in train.

We proceed to confider the fubordinate circumfances contained in this theorem; fuch as, \(1 / f\), The forms which nature or art may give to the bed of a running fream, and the manner of cxprefing this form in nur theorem. 2d, The gradations of the velocity, by which

\section*{Thcory.}

66
Regimen of fireains what.
it decreafes in the different fildments, from the axis or moft rapid filament to the border; and the connection of this with the mean velocity, which is expreffed by our formula. \(3^{\text {d }}\), Having acquired fome diflinct notions of this, we hall be able to fee the manner in which undifturbed nature works in forming the beds of nur rivers, the forms which the affects, and which we mult imitate in all their loc.ll modificatiens, if we would fecure that permanency which is the evident aim of all her operations. We lball here learn the mutual action of the current and its bed, and the circumitances which enfure the fability of both. Thefe we miy call the regimen or the confervatish of the ftreani, and may fay that it is in regimen, or in conjervation. This has a relation, not to the dimentions and the flope alone, or to the accelerating force and the refiltance arifilig from merc inertia ; it refpects imme diately the tenacity of the bed, and is different from the train.
\(4^{t h}\), Thefe pieces of information will explain the deviation of rivers from the rectilineal courfe; the refift. ance occaftoned by thefe deviations; and the circumftances on which the regimen of a winding fream depends.

\section*{§ 1. Of the Forms of the Chanzel.}

67
The remi-

\section*{circular}

\section*{form not} favourable to notion,

The numerator of the fraction which exprefles the velocity of a river in train has \(\sqrt{d}\) for one of its factors. That form, therefore, is moft favourable to the \(m\)-tion which gives the greateft value to what we have called the hydraulic mean depth \(d\). This is the prerogative of the femicircle, and here \(d\) is equal to half the radius; and all other figures of the fame area are the more favourable, as they approach nearer to a femicircle. This is the form, therefore, of all conduit pipes, and Thould be taken for aqueducts which are built of matonry. Eafe and accuracy of execution, however, have made engineers prefer a rectangular form ; but
6.8 neither of thefe will do for a channel formed out of the Sut incom- ground. We fhall foon fee shat the femicircle is incompatible with regimen. patible with a regimen; and, if we proceed through the regular polygons, we fhall find that the h.alf hex:igon is the only one which has any pretenfions to a regimen; yet experience thows us, that even its banks are too fteep for almoft any foil. A dry earthen bank, not bound together by grafs roots, will hardly fand with a
69 llope of 45 degrees; and a canal which convers running
Eanks that waters will not ftand with this flope. Banks whofe Aand beft. bafe is to their height as + to 3 will fland very well in moift foils, and this is a nope very ufually given. This form is even affected in the fpontaneous operations of nature, in the channels which the digs for the rills and rivulets in the higher and fteeper grounds.

This form has fome mathematical and mechanical prnperties which intitle it to fome further notice. Let ABEC (fig. ir.) be fuch a trapezium, and AHGC the rectangle of equal width and depth. Biieet HB and LG by the verticais FD and Ki, and draw the verticals \(b \mathrm{~B}, \mathrm{eE}\). Becaufe \(\mathrm{AH}: \mathrm{HB}=3: 4\), we have \(\mathrm{AB}=5\), and \(B D_{2}=\), and \(\mathrm{FD}=3\), and \(B D+D F=\) BA. From thefe premilfes it follows that the trapezum ABEC has the fame area with the ectangle; for HB being bifected in D, the triangles \(A C F, B C D\) are equal. Alfo the border ABEC, which is touched by the paffing fream, is equal to FDIK. Therefore the mean depth, which is the quotient of the a:ea divided by the border, is the fame in both; and this is the
cafe, whatewer is the width LL at the bottom, or even though there be no rectangle fuch as \(6 \mathrm{BE} \subset\) interpofed between the flant fides.
Of all rectangles, that whofe breadth is twice the Befform height, or which is half of a fquare, gives the greatef of a chan: mean depth. If, therefore, FK be double of FD, the r.e.l. trapezium ABEC, which has the fane arta, will have the largeft mean depth of any fuch trapezium, and will be the beft form of a channal for conveying running waters. In this cafe, we have \(\Lambda C=10, A H=\) 3 , and \(B E=2\). Or we may fay that the belt form is a traperium, whefe bottom vidth is \(\frac{2}{4}\) of the depth, and whofe extreme width is \(\frac{10}{3}\). This form approaches very near to that width the torrents in the hills nathrally dig for themfelves in unifurm ground, where their action i, not checked by flones which they lay bare, or which they depofite in their courfe. This tlows us, and it will be fully confirmed by and by, that the channel of a river is not a fortuitous thing, but has a relation to the confifency of the foil and velocity of the fream.
A rectangle, whofe breadth is \(\frac{4}{3}\) of the depth of water, will therefore have the fame mean depth with a triangle whofe furface width is \(\frac{8}{\frac{8}{2}}\) of its vertical depth; for this is the dimenfions when the rectangle \(b \mathrm{BE} e\) is taken away.

Let A be the area of the fection of any channel, su its widh (when rectangular), and \(b\) its depth of water. Then what we have called its mean depth, or \(d\), will be \(\frac{A}{w+2 b},=\frac{w b}{w+2 b}\). Or if \(q\) expreffes the ratio of the width to the depth of a rectangular bed; that is, if \(q=\frac{w}{b}\),we have a very fimple and ready expreffion for the mean depth, either from the width or depth. For \(d=\frac{q u}{q+2}\), or \(d=\frac{q b}{q+2}\).

Therefore, if the depth were infinite, and the width finite, we fhould have \(d=\frac{\varepsilon v}{2}\); or if the width be inf. nite, and the depth finite, we have \(d=b\)." And thefe are the limits of the values of \(d\); and therefore, in rivers whofe width is always great in comparifon of the depth, we may without much error take their real depth for their hydraulic mean depth. Hence we de- \({ }^{\text {Ir }}\) rive a rule of eafy recollcation, and which will at all of the extimes give us a very near eftimate of the velocity and yerce of a expence of a sunning Aream, viz. that the velocilies are running nearly as the fquare rools of the depths. We find this Rrearn. confirmed by many experiments of Michelotti.

Alfo, when we are allowed to fuppofe this ratio of the velocities and depths, that is, in a rectangular canal of great breadth and fmall depth, we fhall have the quantities \(d\) fcharged nearly in the proportion of the cubes of the velicities. For the quantity difcharged \(a^{\prime}\) is as the velocity and area jointly, that is, as the height and velocity jointly, becaufe when thic width is the fame the area is as the height. Therefore, we have \(d \doteq b v\). But, by the above remark, \(b \doteq v^{2}\). Therefore, \(d \doteq\) \(v^{\prime}\); and this is confirmed by the experiments of Boffut, \(v \mathrm{n}\). ii. 236. Alfo, becaufe \(d\) is as \(v b\), when \(w\) is conftant, and by the abive remark (allowable when \(w\) is very great in proportinn to \(b\) ) \(v\) is as \(V b\), we have \(d\) as \(b \vee b\), or \(b \frac{3}{2}\), or the fquares of the difcharges

Theory. proportiunal to the cubes of the lieights in rectangular bed:, and i:s their correfponding trapeziums.
Kule for 1. Kinowing the mean depth and the proportion of fimbing the the width and real depth, we can deternine the dimendimentiv: ", licns of the bed, and we have \(\quad 0=\eta d+2 d\), and \(b=d\) \(+\frac{2 d}{8}\).
2. If we know the area and mean depth, we can in 1 ke manner fird the dimenfions, that is, su and \(h\); for \(A=w h\), and \(d=\frac{a b}{\varepsilon v-2 h}\); thereforc \(u= \pm \sqrt{\frac{A^{2}}{4 l^{4}}-2 A}\) \(+{ }_{20}^{A}\)
3. If \(d\) be known, and one of the dimenfions be given, we ean find the other ; for \(d=\frac{u b}{w+2 h}\) gives \(w=\frac{2 b d}{l--d}\), and \(b=\frac{w d}{w-2 d}\).
4. If the velocity \(V\) and the nope \(S\) for a river in trana be given, we can find the mean depth; for \(V=\) \(\left(\frac{297}{\sqrt{S}-1 \sqrt{5+1,6}}-0,3\right)(\sqrt{d}-0,1)\). Whence we deduce \(\sqrt{d}-0,1=\frac{V}{\frac{297}{\sqrt{S}-1, \sqrt{S}+1,0}-c, 3}\), and
\(74 \quad \sqrt{d}=\) to this quantity \(+0, \mathrm{r}\).
And Dupe.
5. We can deduce the flope which will put in train a river whofe channel has given dimenfions. We make \(\frac{297}{V+0,3(\sqrt{d}-0,1)}=\sqrt{d}\) S. This Qhould be \(=\sqrt{ } \mathrm{S}\) \(-L \sqrt{S+1,6}\), which we corred by trials, which will be exemplified when we apply thele doctrines to practice.

IIving thus eftablifhed the relation between the different circumitances of the form of the channcl to our general formula, we proceed to conlider,

\section*{9 2. The gradations of velocity from the middle of the Alream to the fides.}

THE knowledge of this is neceflary for underftanding the regimen of a river; for it is the velocity of the filaments in contact with the bed which produces anly change in it, and necalions any preletence of one to another, in refpect of regimen or tabillty. Did thefe circumfances not operate, ilee waters, true to the laws of hydraulics, and confined within the bounds which have been alligned them, would neither enlarge nor diminifh the area of the channel. But this is all that we can promife of whaters perfectly elear, running in pipes or hewn clannels. But rivers, brooks, and fmaller Areams, carry along waters loaded with mud or fand, which they depolit wherever their velocity is checked; and they tear up, on the other hand, the materials of the channel wherever their velocity is fifficiently great. Nature, indeed, aims continually at an equilibrium, and หorks without ceating to perpetuate her own peformances, by eftablifhing an equality of action and reaction, and proportioning the forms and direction of the motions to her agents, and to local circumitances. Her work is fow but unccaling; and what the eannot ac-
complifh in a year the will do in a century. The beds of our rivers have acquired fome \{ability, becaule they are the labour of ages; and it is to time that we nwe thofe decp and wide valleys which receive and confine our rivers is channels, which are now confolidate, and with 有opes which have been gradually modetated, fo that they no longer either ravage our habitations or confound out boundaries. Art may imitate nature, and Nature to by directing her operations (which fle flill carries on ac- be imitated cording to her own impreferiptible laws) according to in making our view, we can haften her progrefs, and accomplifh our purpofe, during the fort period of human life. But we can do this only by Itudying. the unalterable laws of mechanifm. Thefe are prefented to us by fontaneous natuse. Frequently we remain ignorant of their foundation : but it is not neceffary for the profperity of the fubject that he have the talents of the fenator ; he can profit by the flatute without underfanding its grounds. It is fo in the prefent intance. We have not as yet been able to infer the law of retardation obferved in the filaments of a ruming fream from any frund meehanical principle. The problem, however, does not appear beyond our powers, if we aflume, with Sir Iface Newton, that the velocity of any particular flament is the aritlumetical mean between thofe of the flaments immediately adjoining. We may be affured, that the filament in the axis of an inclined cylindrical tube, of which the current is in train, moves the fallelt, and that all thofe in the fame circumference round it are moving with one velocity, and that the flowelt are thote which glide along the pipe. We may affirm the fame thing of the motions in a femi-cylindrical inclined channel conveying in open fream. But even in thefe we have not yet demonftrated the ratio between the extreme velocities, nor in the different circles. This mult be decided experimentally.

And here we are under great obligations to Mr de Buat. He has compared the velocity in the axis of a prodigious number and variety of treams, differing in fize, form, hope, and velocity, and has computed in them all the mean velocity, by meafuring the quantities of water dilcharged in a given time. His method of meafuring the bottom velocity was fimple and juft. He thew in a goofeberry, as nearly as pofible, of the fame fpecific gravity with the water. It was carried along the bottom almolt without touching it. See ResistANCE of Fluids, \(n^{\circ} 67\).

He difcovered the following laws: 1 . In fmall velo- Laws of \({ }^{76}\) cities the velocity in the axis is to that at the bottom the velociin a ratio of confiderable inequality. 2. This ratio di- ties of difminifhes as the velocity increafes, and in very great ve- ferent porlocities approaches to the ratio of equality. 3. What was mof remarkable was, that heither the magnitnde of the chanhel, nor its flope, had any influence in changing this proportion, while the mean velocity remained the fame. Nay, though the ftream ran on a channel covered with pebbles or coarfe find, no difference worth minding was to be obferved from the velocity over a \(p^{\prime}\) lithed channel. 4. And if the velocity in the axis is confant, the velocity at the bottom is alfo conftant, and is not alfected by the depth of water or magnitude of the ftrean. In fome experimerts the depth was thrice the width, and in others the width was thrice the depth. This changed the proportion of the magnitude of the

Thenry: fection to the magnitude of the rubbing part, but made \(\underbrace{}_{\text {no change on the ratio of the velocities. This is a }}\)

77 thing which no theory could point out.
Mean velo- Another moft important fact was alfo the refult of city his obfervation, viz. that the msan velocity in any pipe or

\section*{78} Expreffed by a formula.
open fream is the arithmstica! mean between the velosity in the axis and the velocity at the fieles of a pipe or bottom of an open flean. We have already obferved, thatt the ratio of the velocity in the axis to the velocity at the bottom diminifhed as the mean velocity increafed. This valiation he was enabled to exprefs in a very fimple nanner, fo as to be eafily remembered, and to enable us to tell any one of them by obferving another.

If we take unity from the fquare root of the fuperficial velocity, exprefled in inches, the fquare of the remainder is the velocity at the bottom; and the mean velocity is the balf fum of thefe two. Thus, if the velocity in the middle of the fream be 25 inches per fecond, its fquare root is five; from which if we take unity, there remains four. The fquare of this, or 16 , is the velocity at the bottom, and \(\frac{25+16}{2}\), or \(20 \frac{1}{2}\), is the mean velocity.

This is a very curious and moft nfeful piece of information. The velocity in the middle of the fream is the eatieft meafured of all, by any light fmall body floating down it; and the mean velocity is the one which regulates the train, the difcharge, the effect on machines, and all the moft important confequences.

We may exprefs this by a formula of moft eafy recollection. Let V he the mean velocity, \(v\) the velocity in the axis, and \(u\) the velocity at the bottom; we have \(u=\overline{\sqrt{v}}-1,^{2}\) and \(V=\frac{v+u}{2}\).

Alfo \(v=\left(\sqrt{\overline{\mathrm{V}-\frac{2}{4}}}+\frac{1}{2}\right)^{2}\), and \(v=(\sqrt{u}+1)^{2}\). \(V=\left(\sqrt{v}-\frac{1}{4}\right)^{2}+\frac{1}{4}\), and \(V=\left(\sqrt{u}+\frac{2}{2}\right)^{2}+\frac{x}{4}\).
\[
u=(\sqrt{v}-1)^{2} \text { and } u=\left(\overline{\sqrt{V}}-\frac{1}{T}-\frac{1}{2}\right)^{2}
\]

Alfo \(v-u=2 \sqrt{\mathrm{~V}-\frac{1}{5}}\) and \(v-\mathrm{V},=\mathrm{V}-u\), \(=\) \(\sqrt{\mathrm{V}}-\frac{\mathrm{x}}{4}\) : that is, the difference between thefe velocities increafes in the ratio of the fquare roots of the mean velocities diminifhed by a fmill conftant quantity.

This may perhaps give the mathematicians fome help in afcertaining the law of degradation from the axis to the fides. Thus, in a cylindrical pipe, we may conceive the current as confifing of an infinite number of cylindrical fhells fliding within each cther like the draw tubes of a fpy-glafs. Each of thefe is in equilibrio, or as much accelerated by the one within it as it is retarded by the one without; therefore as the momentum of each diminithes in the proportion of its diameter (the thicknefs being fuppofed the f.me in all), the velocity of feparation moft increafe by a certain law from the fides to the axis. The magnicude of the fmall conflant quantity here fpoken of feems to fix thislaw.

The place of the mean velocity could not be difec- Place of vered with any precifion. In moderate velocities it the mean was not more than one-fourth or one-fifth of the depth velocity diftant from the bottom. In very great velocities it \({ }^{\text {not }}\) difiowas fentibly higher, but never in the middle of the depth.

The knowledge of thefe three velocities is of great importance. The fuperficial velocity is eafily obferved; hence the mean velucity is eafily computed. This multiplied by the fection gives the expence; and if we alfo meafure the expanded border, and then obtain the mean depth (or \(\sqrt{d}\) ), we can, by the formula of uniform motion, deduce the flope: or, knowing the flope, we candeduce any of the other circumftances.

The following table of thefe three velocities wili fave the trouble of calculation in one of the moft frequent queftions of hydraulics.
\begin{tabular}{|c|c|c|c|c|c|c|c|c|}

\end{tabular}

The hnowledge of the velocity at the bottom is of the greateft ufe lor enabling us to judge of the action of the tream on its bed; and we flall nos make fome dufenvations on this particular.
Every kind of foil has a certain velocity confiftent with the llability of the channcl. A greater velocity would enable the water to tear it up, and a fmaller velocity would permit the depofition of more moveable materials from above. It is not enough, then for the thability of a river, that the accelerating forces are fo adjufled to the fize and figure of its channel that the current may be in train: it mult alfo be in equilibrio with the tenacity of the chanuel.

We learn from obfervation, that a velocity of three inches per feeond at the bottom will jufl begin to work upon fine clay fit for pottery, and however firm and compart it may be, it will tear it up. Fet no beds are more fable than clay when the velocities do not exceed thil:: for the water foon takes away the impalpable particles of the fitperficial clay, leaving the particles of find Reicking by their lower half in the rett of the clay, which they now protect, making a very permanent bottom, if the ftrcam does not bring down gravel or coarfe land, whith will rub off this very thin crult, and allow
another layer to be worn off; a velocity of fix inches will lift fine fand ; eight inches will lift fand as coarfe as lintfeed; 12 inches will fweep along fine gravel ; 24 inches will roll along round pebbles an inch diameter; and it requires three feet per fecond at the bottom to fweep along fhivery angular fones of the fize of an egg.

\section*{82}

The manner in which unwearied nature carries on How car fome of thefe operations is curious, and deferves to be ried on, noticed a little. All muft recollect the narrow ridges or wrinkles which are left on the fund by a temporary frefh or ftram. They are oblerved to lie acrofs the Aream, and each ridge confifts of a teep face \(\mathrm{AD}, \mathrm{BF}\) (fig. H.) which looks cown the ftream, and a gentler flope D B, FC, which conneets this with the next ridge. As the flream comes over the firf feep AD , it is directed almoft perpendicularly againf the point E immediately below 1 , and thus it gets huld of a particle of coarfe fand, which it could not have detached from the reft had it becn moving parallel to the furface of it. It eafily rolls it up the gentle flope EB; arrived there, the particle tumbles over the ridge, and lies clofe at the bottom of it at F , where it is protected by the little eddy, which is formed in the very angle ; other par- tumbling over the 1 idge \(B\), cover the firit particle, and now proted it eftectuatiy from any further dilturbance. The lame operation is going on at the bottom of each ridge. The brow ar iteep of the ridge gradually achvances down the itram, and he whole act change their placs, as reprefented by the dotte \(\perp\) line adbf; and after a ecrian time the particle which was depofited at \(F\) is tound in an unpotetted lituation, as it was in \(E\), and it now makes another itep down the fream.

The Ablé Bollut fo nd, that when the relocity of the itream was juft fufficient for lifting the fand (and a finall excefs hindered this operation aliogether) a ridge advanced about so feet in a day.

Since the current carric; off the moft moreable matters of the channel, it leives the botom covered with the remaming coarfer land, gravel, pebbles, and larger itunes. T'o thefe are added many which come down the itrem whise it is more rapid, and alfo many which rull in from the lides as the banks wear away. All thete furm a bottom much more folid and immiveable than a bottom of the medium foil would have been. But this does not always maintain the channel in a permanent form; but frequently occafions great changes, by ubliging the current, in the event of any fudden frefh or fwell, to enlarge its bed, and even to change it altogether, by working to the right and to the left, fince it cannot work downwards. It is generally from fuch accumulation of gravel and pebbles in the bottom of the bed that rivers change their clannels.

It remains to afcertain, in abfolute meafures, the force which a current really exeats in attempting to drag alung with it the materials of its channel; and which will produce this effect unlefs relifted by the inertia of thete matcrials. It is.therefore of practical importance to know this force.

Nor is it abltrufe or difficult. For when a current is in train, the accelerating force is in equilibrio with the retiltunce, and is therefore its immediate meafure. Now this accelerating force is precifely equal to the weight of the body of water in mntion multiplied by the fraction which expreffes the flope. The mean depth being equal to the quotient of the fection divided by the border, the tection is equal to the product of the mean depth multiplied by the border. Therefore, calling the border \(b\), and the mean depth \(d\), we have the fection \(=d b\). The body of water in motion is there. fore \(d b s\) (becaufe s was the flant length of a part whofe difference of elevation is 1 ), and the accelerating
force is \(d b s \times \frac{1}{s}\), or \(d b\). But if we would only confider this refiftance as correfponding to an unit of the lengih of the channel, we mult divide the quantity \(d b\) by \(s\), and the reliftance is then \(\frac{d b}{s}\). And if we would confider the refiftance only for an unit of the border, we mutt divide this expreffion by \(b\); and thas this refirtance (taking an incls for the unit) will be expreffed for one fquare incl? of the bed by the weight of a bulk of water which has a fquare inch for its bafe, and \(d\) \({ }_{s}^{d}\) for its height. And lafly, if E be taken for any given fuperficial extent of the channel or bed, and F the Vor. XVI.
obfruction which we confider as a furt of friction, we Thall have \(F=\frac{E d}{s}\).
Thus, let it be required in determine in pounds the refittan ce or fretion on a fquare yard of a channel whefe curecne is in train, which is 10 feet wide, four fcet deep, and has a flope of one foot in a mile. Here \(E\) is ni.c fee. Ten \(f\) fet widh and four beet depth give a fection of 40 fct . The border is 13 feet. There. fore \(d=\frac{40}{18}=2,1111\), and \(s\) is 5280 . The:cfore the friction is the weight of a column of water whofe bafe is nine feet, and height \(\frac{2,1111}{5280}\), or ncarly \(3 \div \frac{6}{\%}\) ources avoirdupois.

\section*{§ 3. Setilement of the Beds of Rivers.}

He who looks with a carelefs eye at a map of the simplicity world, is apt to confider the rivers which ramble over and wifits iurface as a chancc-medly difpolition of the drainers which carry off the waters. But it will afford a mof agreeable object to aconliderate and contemplative mind, the take it up in this very fimple light; and liaving conlidered the many ways in which the drenched furface might have been cleared of the fuperfluous waters, to attend particularly to the very way which nature lias followed. In following the troubled waters of a motintain torrent, or the pure itreams which trickle from their bates, till he fees them fwallowed up in the ocean, and in attending to the many varieties in their motions, he will be delighted with obferving how the fimple laws oi mechanifm are made fo fruitfulin good confequences, hoth by modifying the motions of the waters themfelves, and alfo by inducing new forms on the furface of the earth, fitted for re-ating on the waters, and producing thefe very modifications of their motions which render them fo beneficial. The permanent beds of rivers are by no means fortuitous gutters haflily fcooped out by dathing torrents; but both they and the valleys through which they flow are the patient but unceafing labours of nature, prompted by goodnefs and directed by wifdnm.

Whether we trace a river from the torrents which collect the fuperfluous waters of heaven, or from the fprings which difcharge what would otherwife be condemmed to perpetual inactivity, each feeder is but a little rill which could not ramble far from its fcanty fource among growing plants and abforbent earth, without being fucked up and evaporated, did it not meet with other rills in its courfe. When united they form a body of water flill inconfiderable, but much more able, by its bulk, to overcome the little obffacles to its motion; and the rivulet then moves with greater fpeed, as we have now learned. At the fame time, the furface expofed to evaporation and abforption is diminilhed by the union of the rills. Four equal rills have unly the furface of two when united. Thus the portion which efcapes arreftment, and travels downward, is continually increafing. This is a happy adjuftment to the other operations of nature. Were it otherwife, the lower and more valuable countries would be loaded with the paffing waters in addition to their own furplus rains, and the imniediate neighbourhood of the fea would be almolt covered by the drains of the interior N: countries

Theers い countres. Du:, fortunately, thofe palling waters occumerit room as they advance, and by this wite employ fluous the mott fimple mealus, not only are the lipes drains themfeleses become an ulelul past of thie but the by their magnitude. They become the habitation of a pojigious number of filhes, which thare the Cacator's bounty ; and they becone the manns of mutual communication of all the bletlings of cultivated fociety. "The vague ramblings of the rivers featter them over the face of the country, and bring them to every docr. It is not even an indifferent circumftance, that they gather frength to cut out deep beds for themlelves. Hy this means they cut open many fiprings. Without this, the yrokice of a heavy thower would make a fwamp which would not dry up in many days. And is mult be oblerved, that the fame heat which is necelfary for the vigorots growth of ufeful plants will produce a very copious evaporation. This mult return in fhowers much too copious for immediate regetation, and the overplus would be deltuctive. Is it not pleafant to contemplate this adjuftment of the great operarions of nature, fo differentrom each other, that if chance alone directed the detail, \(\mathrm{i}^{\prime}\) was almoft an infinte odds that

84
Their effert on the countries through which they yafo. the earth would be uninhabitable?

But let us follow the waters in their operations, and note the face of the countries through which they flow : attending to the breadth, the depth, and the tlope of the valleys, we fhall be convinced that their prefent fituation is extremely different from what it was in ancient days; and that the valleys themflves are the works of the rivers, or at leaft of waters which have defcended from the heights, loaded with all the lighter matters which they were able to bring away with them. The rivers flow now in beds which have a confiderable permanency; but this bas been the work of ages. This has given fability, both by filling up and fimoothing the valleys, and thus leffening the changing caufes, and alfo by hardening the beds themielves, which are now covered with aquatic plants, and lined with the fones, gravel, and coarfer find, out of which all the lighter matters have been wathed away.

The furface of the high grounds is undergoing a continual change; and the ground on which we now walk is by no means the fame which was trodden by our remote anceftors. The thowers from heaven carry down into the valleys, or fweep along by the torrents, a part of the foil which covers the heights and fteeps. The torrents carry this foil into the brooks, and thefe deliver part of it into the great rivers, and thefe difcharge into the fea this lertilizing fat of the earth, where it is fwallowed up, and forever lof for the purpafes of vegetation. Thus the hillacks lofe of their height, the valleys are filied up, and the mountains are laid bare, and thow their maked precipices, which formerly were covered over with a tieth and Ikin, but now lnok like the feleton of this gl-be. The low countries, raifed and nourithed for fune time by the fubAtance of the ligh lands, will go in their tum to be buried in the ocean; and then the earth, reduced to a dreary flat, will become an immenfe uninhabitable mafs. This catall: ophe is fur diftant, becaufe this globe is in it yourh, but it is not the lefs certain; and the united labours of the humanrace could not long protract the term.

But, in the rean time, we can trace a beneficent
purpofe, and a nice adjulnment of feeningly remote circumflances. The grounds near the fources of all our tivers are indeed gradually ftripped of their molt fertile ingredients. lut had they retained them for ages, the bencficence ingred fentient inhabitants of the earth, or at leaft the nobler animals, with nan at their head, would not have derived much advanzage from it. 'lhe general laws of nature produce changes in our atmofphere which muft ever render thefe great elcvations unfruitiul. That ge. nal warmth, which is eqully necelfary for the ufeful plant as for the animal which lives on it, is confined to the l.wer grounds. The earth, which on the top of mount Hxmus conlel only bring forth mofs and dittany, when brought into the gardens of Spalatro, pruduced pot-herbs to luxuriant, that: Dioclefinn told his colleague Maximan that he had nore pleafure in their cultivation than the Roman empire could confor. Thus nature not only provides us manure, but convcys it to our fields. She even keeps it fafe in fore for us till it flall be wanted. The trats of country which are but newly inhabited by man, fuch as great part of America, and the newly difcovered regions of Terra Aultralis, are ftill almolt occupied by marthes and lakes, or covercd with impenetrable forefts; and they would remain long enough in this tate, if population, continually increafing, did not increafe indultry; and multiply the hands of cultivato:s along with their neceflities. 'The Author of Nature was alone able to form the huge ridges of the mountains, to model the hillocks and the valleys, to mark out the courfes of the great rivers, and give the firf trace to every rivulet; but has lefr to man the talk of draining his own habitation and the fields which are to fupport him, becaure this is a tafk not beyond his powers. It was therefore of immenfe advantage to him that thofe parts of the globe into which he has not yet penetrate.! fhould remain covered with lakes, marfhes, and forefts, which keep in ftore the juice of the earth, which the influence of the air and the vivifying warmth of the fun would have expended long ere now in ufelefs vegetation, and which the rains of heaven would have fwept into the fea, had they not been thus protected by their fituation or their cover. It is therefore the bufmefs of man to open up thefe mines of hoarded wealth and to thank the Author of all good, who has thus hubanded them for tis ufe, and left them as a rightlul heritage for thofe of after days.

The earth had not in the remote ages, as in our dity, thofe great canals, thofe capacious voiders, aluays ready to drain off the rain waters (of which only part is abforbed by the thir(ty ground), and the pure waters of the frings from the foot of the hills. The rivers did not then exilt, or were only torrents, whofe waters, confined by the gullies and glens, are fearching for a place to elcape. Hence arife thofe numerous lakes in the interion of great continents, of which there are fill remarkable relicks in North America, which in procefs of time will difappear, and become champaign countrits. 'The mof remote from the fea, unable to contain its waters, finds an iffuc through fome gorge of the hills, and puurs over its fuperfuous waters into a lower bafon, which, in its turn, difcharges its contents into another, and the laft of the chain delivers its waters by at river into the ocean. The communication was originally begun by a fimple overflowing ar the lowelt part of the margin. I'his made a torrent, whech
quickly deepened its bed; and this circumftance increafing its vel city, as we have feen, would extend this decpening backward to the lake, and draw oll more of its wa ers. The work would go on rapidly at frlt, whle earth and fmall fones only refilted the labours of nature; but thefe being wathed away, and the channel hollowed out to the firm rock on all fides, the operation mult go on very fowly, till the immenle cafate thall unde mine what it cannot break off, and then a new difcharge will commence, and a quantity of flat ground will emerge all round the lake The torrent, in the mean time, makes its way down the country, and digs a canal, which may be called the firt fketch of a river, which will deepen and widen its bed continnally. The waters of feveral bafon, united, and ronning tugether in a great \(b \mathrm{~d} y\), will (according to the principles we have cttablifhed) have a much greater velocity, with the fame flope, than thofe of the lakes in the interior parts of the continent; and the fum of them all united in the bafon next the fea, after hitving broken through its natural mound, will make a prodigious torrent, which will dig for itfelf a bed fo much the deeper as it has more llope and a greater body of waters.

The formation of the firft valleys, by cutting open many ferings which were formerly concealed under ground, will add to the mars of running waters, and contribute to drain off the waters of thefe bafons. In courle of time many of them will difappear, and flat valleys among the mountains and hills are the traces of their former exiftence.

When nature thus traces out the courfes of future rivers, it is to be expected that thofe Areams will mon deepen their channels which in their approach to the fea receive into their bed the greateft quantities of rain and fpring waters, and that towards the middle of the continent they will deepen their channels lefs. In thefe laft fituations the natural flope of the fields caufes the rain-water, rills, and the little rivulets from the fprings, to feek their way to the rivers. The ground can tink only by the flattening of the hills and high grounds; and this muft proceed with extreme flownefs, becaufe it is only the gentle, though inceffant, work of the rains and fprings. But the rivers, increafing in bulk and lirength, and of neceffity flowing over every thing, form to themfelves capacious beds in a more yielding foil, and dig them even to the level of the ocean.

The beds of rivers by no means form themfelves in one inclined plane. If we thould fuppofe a canal \(A B\) (fig. 12.) perfectly ftraight and horizontal at \(B\), where it joins with the lea, this canal would really be an inclined channel of greater and greater llope as it is far- ther from B. This is evident; becaure gravity is directed towarcis the centre of the earth, and the angle CAB contained between the channel and the plumbline at \(A\) is fmaller than the limilar angle \(C D B\); and confequently the inclination to the horizon is greater in A than in D. Such a canal therefore would make the bed of a river; and fome have thought that this was the real form of nature's work; but the fuppofition is a whim, and it is falfe. No river has a flope at all approaching to this. It would be 8 inches declivity in the mile next the cean, \(2+\) inches in the fecond mile, 40 inches in the third, and fo on in the duplicate ratio (for the whole elevation) of the diftances from the fea. such a river would quickly tear up its bod in the moun-
tains (were there any grounds ligh enough to receive it), and, except its finf cafcade, would foon acquire a more gentle flope. But the fact is, and it is the refu't of the imprefcriptible laws of nature, that the continued track of a river is a fucceffion of inclined channels, who.e flope diminifhes by fteps as the river approaches to the lial. It is not ennugh to fay that this refnits from the natural Mope of the countries through which it flows, which we oblerve to increale in declivity as we go to the interior parts of the continent. Were it otherwife, the equlibrium to which nature aims in all her operat ons would ftill prodace the gradual diminution of the flope of rivers. Without it they could not be in a p rmanent train.

That we may more eafily form a notion of the man- How the ner in which the permanent courfe of a river is efta- permanent blifhed, let u : fuppofe a itream or rivulet \(s\) a (fig. 13 .) cunfe of a far up the country, make its way through a foil per- efter is fectly uniform to the fea, taking the courle sabcdef, and receiving the pcrmanent additions of the freams \(g a\), \(b b, i c, k d, l e\), and that its velocity and hope in all its parts are fo fuited to the tenacity of the foil and magnitude of its fection, that neither do its waters during the annual frefles tear up its banks or deepen its bed, nor do they bring down from the high lands materials which they depofit in the channel in times of fmaller velocity. Such a river may be faid to be in a permancnt flate, to be in confervation, or to have fability. Let us call this tate of a river its regimen, denoting by the word the proper adjultment of the velocity of the fream to the tenacity of the channel. The velccity of its regimen muft be the fame throughout, becaufe it is this which regulates its action on the bottom, which is the fame from its head to the fea. That its bed may have flability, the mean velecity of the current mult be conftant, notwithftanding the inequality of difcharge, through its different fections by the brooks which it receives in its courfe, and notwithltanding the augmentation of its fection as it approaches the fea.

On the other hand, it behoved this exact regimen to commence at the mouth of the river, by the working of the whole body of the river, in concert with the waters of the ocean, which always keep within the fame limits, and make the ultimate level invariable. This working will begin to dig the bed, giving it as little breadth as poffible: for this working confilts chiefly is the efforts of falls and rapid ftreams, which arife of themfelves in every channel which has too much flope. The bottom deepens, and the fides remain very fteep, till they are undermined and crumble down; and being then dilused in the water, they are carried down the fream, and depolited where the ocean checks its fpeed. The banks crumble down anew, the valley or hollow forms; but the fection, always confined to its bottom, cannot acquire a great breadth, and it retains a good deal of the form of the trapezium formerly mentioned. In this manner does the regimen begin to be eftablifhed from \(f\) to \(c\).

With refpect to the next part \(d e\), the difcharge or produce is diminifhed by the want of the brook le. It mult take a fimilar form, but its area will be diminifhed, in order that its velocity may be the fame; and its mean depth \(d\) being lefs than in the portion ef below, the flope mut be greater. Without thefe conditions we could not have the uniform velocity, which the affumed
theary.
permanency i: an uniburm fuil necuranily fuppofes. Reatoning ater the fame manner for a'l the portions id, \(b\) c, ali, \(s a\), we fee that the regimen will be fuccefSx:ly eithblithed in timm, and that the thane necelfory ior the purpofe will be greater as we approath the aiwer he:a. The vertical fedion or profile of the courte - Hhe river sab ctef will therefure refemble the line S. 1 BCDIF which is thecthed below, having its differ. rot parts varioully inclined to the herienatal line I-11:

Such is the precels of mature to be obierved in every niver on the furtace of the globe. It long appeared a biat of puzzle to the theorifs; and it was this obterva-t:- 1 of the increalin:'s, or at leat this con:ibued velocity with imaller flope, as the rivers increated by the addition of their tributary frems, which caufed Guglielnini to have recourfe to his new principle, the ener\(g y\) of diep waters. We have now feen in what this tion remaining in the middle of a great ftream of wa-t-r after a quantity has been retarded by the fides and bottom; and we fee clearly, that fince the addition of a new and perhaps in cqual fitream does hot occupy a bed of double furlace, the proportion of the retarditiens to the remaining motion muft contincally diminith as a tiver increafes by the addition of new ftreams. It therefore the flope were not diminithod, the regimen would be deflroyed, and the :iver would dig up its channel. We have a full confirmation of this in the many works which have been executed on the lo, which runs with rapidity through a ach ard yielding foil. Ab,ut the jear 1600 , the waters of the Panarn, a very confiderable river, were added to the Po Grande ; and although it brings along with it it its frefhes a valt quantity of fand and mud, it has greatly deepened the whole Tronco di Venezia from the conflaence to the fe.. This point was clearly afcertained by Nanfredi about the 1720 , when the inhabiants of the valleys adjacent were alarmed by the project of bringing in the waters of the Rheno, which then ran through the Ferratefe. Their fears were overcome, and the Po Grande continues to deepen its channel every day with a prodigious advantage to the navigations; and there are feveral extenfive marfhes which now drain off by it, after having been for ages under water: and it is to be partienlarly remarked, that the Rteno is the fouleft river in its frefles ot any in that commery. We infert this remark, becaufe it may be of great practical utility, as pointing out a methed of preierving and even improving the depth of rivers or drains in flat countrics, which is not chvious, and rather appears improper : but it is ftrictly conformable to a true theory, and to the operations of nature, which never fails to adjuft every thing fo as to bring about an equilibrium. Whatever the declivity of the country may have been origimally, the regimen beginsto be fettled at the mouthis of the rivers, and the hopes are diminifhed in fucceffion as we recede from the cout. Th original flopes inland may have been much greater; but they will (when bufy nature has completed her work) be left fomewhat, and only fo much greater, that the velocity mav be the fame notwithtanding the dimination of the fection and mean depth.

Frefhes will dilturb this methodical progrefs relative only to the fucceflive permanent additions; but their effels chiefly accelerate the decpening of the bed, and
the diminution of the flope, b! augnentisg the velocity during that comtimanse. But when the regimen of the pernament addit:ons is once eftablithed, the frethes tend chicfly to wisen the bed, wathout greatly deepening it: for the aguric phants, which have been growing and thriving during the peaceable tlate of the river, ant now laid :long, but not fwept away, by the frehes and blosect the bottom from their attacks; and the flones and gravel, which mut have been left bare in a cenre of ycars, werking on the fint, will alfo collect in the buttom, and greatly augment its power of refigance: and cven if the lloods fhould bave deepened the bottom fome limall matter, fone mad will be depofited as the velocity of the frethes diminithes, and this will remain till the nert fiond.

We have fuppofed the foil uniform through the whole courfe: This ieldem happens; therefore the circomflances which inture permanency, or the regimen of: diver, nay be very different in its different parts and in different fivers. We may fay in general, that the farther that the regimen has advanced up the fream in any river, the morc llowly will it convey its waters to the fea.

There are fome general circumfances in the motion of aivers which it will be proper to take notice of jult now, that they may not interrupt our more minute examination of their mechanim, and their explanations will then occur of themfelves as corollaries of the propofitions which we flat endeavour to demonitrate.

In a valley of fmall width the river always ccupies the In narrow lowelt part of it ; and it is obferved, that \(t\) is is teldom valleysriin the middle of the valley, ard is nearelt to that fide vers adon which the flope from the higher grounds is fteepeft, herc to the and this without regard to the line of its courfe. The teeper river generally adheres to the fleepef liblls, whether they advance into the plain or retire from it. This general leature maly be obferved over the whole globe. It is divided into er p.rtments by great ranges of mountains; and it may be obferved, that the great rivers hold their courfe not very far from them, and that their chief feeders come from the other fide. In every copartment there is a fwell of the low country at a diftance from the bounding ridge of mountains; and on the fummit of this fiwell the principal feeders of the great river have their fources.

The name ralley is given with lefs propriety to thefe immenfe regions, and is more applicable to tracks of champaign land which the eye can take in at one view. Even here we may obferve a refemblance. It is not always in the very lowef part of this valley that the river has its bed; although the waters of the river flow in a channel below its immediate banks, thele banks are frequently higher than the grounds at the foot of the hills. This is very diftinatly feen in Lower Egypt, by means of the canals which are carried backward from the Nile for accelerating its fertilizing inundations. When the califhes are ope ed to admit the waters, it is always obferved that the dillrids moll remote are the firlt covered, and it is teveral days before the immediately adjoining fields partake of the bleffing. This is a confequence of that general operation of nature by which the valleys are formed. The river in its floods is loaded with mud, which it retains as long as it rolls rapidly along its limited bed, tumbling its waters over and ovcr, and taking up io crery fpot as much as
it depolits : but as foon as it overflows its barks, the
very enlargement of its fection diminilles the velocity very enlargement of its fection diminilhes the velocity
of the water; and it may be obferved fill running in the track of its bed with great velocity, while the waters on each fide are ftagnant at a very fmall diftance: Therefore the water, on getting over the banks, mulk depofit the heavielt, the firmelt, and even the greateit part of iss burden, and mult become gradually clearer as it approaches the hills. Thus a gentle flope is given to the valley in a direction which is the reverfe of what one woull expect. It is, however, almult always the cafe in wide valleys, effecially if the great river cumes through a folt country. The b.mks of the brooks and ditches are obferved to be deeper as they approach the river, and the merely fuperticial drains run backwands irum it.

We have already obferved, that the enlargement of the bed of a tiver, in its approach to the feia, is not in propartion to the increafe of its waters. This would be the cafe even if the velucity continued the fame: and therefore, fince the velocity eveu increafes, in confequence of the greater energy of a large body of water, which we now anderttaid diftinstly, a thill fmaller bed is fulficient for conveying all the water to the fea.

This general law is broken, however, in the immediate reizhbourhuod of the tea; becaufe in this fituation the velocity of the water is checked by the paffing flood-tides of the oce:an. As the whole waters mult Itill be ditcharged, they require a larger bed, and the enlargement will be chiefly in width. The fand and mud are depofited when the mation is retarded. The depth of the mouth of the channel is therefore diminithed. It mult therefore become wider. If this be done on a coalt expofed to the force of a regular tide, which carries the waters of the ocean acrefs the mouth of the river, this regular enlargement of the mouth will be the only confequence, and it will generally widen till it wafhes the foct of the adjoining hills; but if there be no tide in the fea, or a tide which does not fet acrofs the mouth of the river, the fands muft be depofited at the fides of the opening, and become additions to the fhore, lengthening the mouth of the channel. In this fheltered fituation, every trivial circum. ftance will caufe the river to work more on particular parts of the bottom, and deepen the channel there. This keeps the mod fulpended in fuch parts of the channe!, and it is not depofited till the tiream has thot farther out into the fea. It is depofited on the fides of thofe deeper parts of the channel, and increafes the velocity in them, and thus fill farther protracts the depofition. Rivers fo fituated will not onily lengethen tiecir channels, but will divide them, and produce iflands at their mouths. A bufh, a tree torn up by the roots by a mountain torrent, and floated down the fleam, whll thus inevitably produce an inand; and rivers in which this is common will be continually fhifting their mouths. The Minfflippi is a moft remarkable inflance of this. It has a lor, g courle through a rich foil, and difembogues itfelf into the Bay of Mexico, in a place whare there is no pafing tide, as may be feen by comparing the hours of high water in difierent place. No river that we know carries down its Itream fuch \(1.4 \mathrm{~m}-\) bers of rooted-up trees: they frequently interrupt the navigation, and render it always dangerous in the night-
time. This river is fo befet with flats and mifting fands at its mouth, that the mott experienced piluts are pez. zled; and it has protruded its channel above 50 miles in the hort period that we have known it. 'He dif. charge of the Danube is very fimilar: fu is that of the Nile; for it is difcharged into a thill corner of the INediterranean. It may now be haid to have acquired eonfiderable permarency; Lut much of this is owing to human indutiry, which frips it as much as fofible of its fubfideable matter. The Ganges two is in a fi. un.tion fretty finiar, and exhibits limilar phenomena. The Muagnon might be noticed as an exception; tut it is not an exception. It has flowed very far in a level bed, and its waters come pretty clear to Para; but befides, there is a ftrong traniverte tide, or ratlier current, at i:s mouth, fetting to the louth-eaft both during flood and cblo. The mouth of the Po is perha, s the molt remarkable of any on the furface of this glube, and exhabits appearances extremely fingular. Its diflharge is into a lequeltered corner of the Adriatic. Though there be a more remarkable tide in this gulpls than in any part of the Mediterrancan, it is fill but tritling, and it cither fets directly in upon the month of the rwer, or retires flraight awar from it. The diver has many muuths, and they thift prodigiounf. There has been a general increafe of the land very remarkable. The marihes where Venice now flands were, in the Auguftan age, everywhere penetrable by the finhing boats, and in the \(5^{\text {th }}\) century could only bear a few miferable huts; now they are covered with crowds of tately buildi:-gs. Ravenna, fituated on the louther nmolt mouth of the Po, was, in the Auguflan age, at the extremity of a fwamp, and the road t it was along the top ot an artificial mourd, made by Auguftus at immenfe expence. It was, however, a fine city, containing extenfive docks, arfenals, and other matiy buildings, being the great military port of the empire, where Augultus laid up his great fhips of war. In the Gothic times it became almoft the capital of the Weftern empire, and was the feat of government and of lixury: It muft, therefore, be fuppofed to have every accommodation of opulence, and we cannot doubt of its having paved ftreets, wharfs, \&c.; fo that its wealihy inhabitants were at leaft walking dryfooted from houfe to houfe. But now it is an Italian mile frum the fea, and furrounded with vineyards and cultivated fields, and is accelible in every drection. All this mult have been formed by depolitions from the Po, Howing through Lombardy loaded with the fpoils of the Alps, which were here arrefted by the reeds and bulrulises of the marfh. Thefe things are in common courfe; but when wells are dug, we come to the pavements of the anciert city, and thefe pavements are all on one exact level, and they are eigbt feet below the furface of the fea at low zuater. This cannot be afcribed to the fubliding of the ancient city. This would be irregular, and greatelt among the heavy buildiogs. The tomb of 'lheodoric 1 emains, and the pavement round it is on a level with all the others. The lower fory is always full of water; fo is the lower fory of the cathedral to the depth of three feet. The ornaments of both there buildings leave no room to doubt that they were formerly dry; and fuch a building as the cathedral could not link without crumbling into pieces.

It is by no means eafy to account for all this. The depofitio..s
depofitions of the Po and other rivers nult raife the ground ; and yet the rivers mult fill fow over all. We inult conclude that the furface of the Adratic is hy no means level, and that it llopes like a ives from the Latgonn of Venice to the cattward. In all probability it even flopes contiderably ourwards from the flore. This wil not hinder the altermations of chb and fow tide, as will be thown in its proper phice. The whole thores of thi gulph exhibit om of uncomann appearance-.
Fivers The l.al general whervations of. ich we thall make in are ernver thin plice is that the furlace of a river is not fat, enna, hwart fidercd athwant the ftream, but convex: this i , owing the Presm,
aid ithe
its motion. Suppofe a canal of thagnamt water ; its cacte of it. furface world be a perfea level. Dut duppofe it poflible by any means to give the middle waters a moti. n ia the direaton of its length, they mult drag along with them the witers immeanately contigurus. Thefe will move lefs fwifly, and will in like manner drag the waters with ut them; and thus the water at the lides being abtiracted, the depth mult be lefs, and the general furface mut be coavex actofs. The lat in at running flream is finiliar to this; the fide waters are withheld by the fides, and every filament is moving more finwly than the one next it iowards the middle of the river, but fifter than the adj.sining filament on the land fide. This alone muft produce a convexity of furface. But befides this, it is demonltrable that the preffure of a running ftream is diminifhed by its motion, and the dimnution is proportional to the lieight which would produce the velocity with which it is gliding palt the adjoining filament. This convexity mult in all cafes be very fmall. Fow rivers have the velocity nearly equal to eight feet per fecond, and this requires a height of one foot only. An author quoted by Mr Butfon fays, that he has obferved on the river Aveiron an elevation of three feet in the middle during floods; but we fufpect fome error in the obfervation.

\section*{\$4. Of the Windings of Rivers.}

Risers are fellom ftraight in their courfe. Formed by the hand of nature, they arc accommodated to every change of circumftance. They wind around what they cannot get over, and work their way to either fide according as the refiftance of the oppofite bank makes a Itraight courfe more difficult ; and this feemingly fortuitous rambling diftributes them more uniformly over the furface of a country, and makes them every where more at hand, to reccive the numberiefs rills and rivulets which coiled the waters of nur fprings and the fuperfluities of our thowers, and to comfort our habitations with the many advantages which cultivation and fociety can derive from their prefence. In their feeble heginnings the fmalleft incquality of flope or conliftency is enougls to turn them afide and make them ramble through every field, giving drink to our herds and fertility to our foil. The more we follow nature into the minutix of her operations, the more mult we admire the incxhautible fertility of her refources, and the fim. plicity of the means by which the produces the moft important and beneficial effcets. By thus twifting the confe of our rivers into 10,000 fhapes, the keeps them long amadit our ficl ds, and thus compenfates for the declivity of the furface, which otherwiic would tumble them with great rapidity into the ocean, loaded with the beft and richeft of our foil. Without this, the
fhowers of heaven would have littie influence in furply. ing the walle of inceliamt cvapozation. But as things are, the rains are kept fluwly trickling along the floping fides of , ur hills and fteeps, winding round every clod, nay every plane, which lengthens their courfe, diminithes their flope, checks their fpeed, and thas prevenis them from quickly bruthing off from every part of the furface the lightett and beft of the foil. The flattelt of our t : Ins lands w uld be too theep, and the riwers would tho t aleng through rur finelt mealows, hurlying every thing away with them, and would be unfit for the purpoles of inland conveyance, if the incqualitics of \(f\) il did not make them change this beadjons; courfe for the more beautiful meanders which we obferve in the courfe of the fmall rivers winding throngh our meadows. Thofe rivers are in general the ftraighteft in their courle which are the moft rapid, and which roll along the greateft bodies of water; fuch are the Rhone, the Po, the Danube. The finaller rivers continue more devious in their progrefs, till they approach the feat, and have gathered frength from all their tributary flreams.

Every thing aims at an equilibrinm, and this directs even the ramblings of rivers. It is of importance to underttand the relation between the force of a river and the refitance which the foil opfofes to thole deviations from a rectilineal courfe; for it may frequently happen that the general procedure of nature may be inconfiflent with our local purpofes. Minn was fet down on this globe, and the talk of cultivating it was given him by nature, and his chief emjoyment feems to be to Aruggle with the elements. He mult not find things to his mind, but he muft mould them to his own fancy. Yet even this feeming ancmaly is one of nature's moft beneficent laws; and his exertions mult fill be made in conformity with the general train of the operations of mechanical nature: and when wa have any work to undertake relative to the courfe of rivers, we mult be careful not to thairt their general rules, otherwife we flall be fooner or later punifhed for their infraction. Things w:ill be brunght back to their former flate, if our operations are inconfilient with that equilibrium which is conltantly aimed at, or fome new flate of things which is equivalent will be foon induced. If a well regulated wiver has heen improperly deepened in fome place, to anfiwer fome particular purpofe of our own, or if its breadth has been improperly augmemted, we thall foon fee a depofition of mud or fand choak up our fancied improvements; becdufe, as we have enlarged the feetron without increaling the llope or the fupply, the velecity mult diminifh, and floating matters muft be depolited.

It is true, we frequently fee permanent channels where the foms are extremely different from that which the waters would dig for themfelves in an uniform foil, and which approaches a good deal to the trapezium described fonmerly. We fee a greater breadth frequently componite for a want of depth; but all fuch devidtions are a fort of contraint, or rather are indications of incquality of foil. Such irregular forms are the works of nature; and it they are permanent, the cquilitrium is obtained. Commonly the botom is harder than the fides, confiling of the coarfeft of the fand and of gravel; and therefore the neceffary feation can be obtained only by increafing the width. We
are accuftomed to attend chicfly to the appearances which prognolticate mifchief, and we interpret the appearances of a permanent bed in the fame way, and frequently form very falfe judgments. When we fee one bank: low and flat, and the other high and abrupt, we fuppofe that the waters are paffing along the firft in peace, and with a gentle frcam, but that they are rapid on the other fide, and are tearing away the bank ; but it is juft the contrary. The bed being permanent, things are in equilibrio, and each bank is of a form jutt competent to that equilibrium. If the foil on both fides be unilorm, the Itream is molt rapid on that fide where the bank is low and flat, for in no other form would it rithitand the action of the frean; and it has been worn away till its flatnefs compenfates for the greater force of the ltreans. The flueam on the other lide muft be more gentle, otherwife the bank could not remain abrupt. In fhort, in a fate of permanency, the velocity of the flream and form of the bank are juft fuited to each other. It is quite otherwile before the river has acquired its proper regimen.

A careful confideration therefore of the general features of rivers which have fettled their regimen, is of ufe for informing us concerning their internal motions, and direating us to the moth effectual methods of regulating their courfe.

We have already faid that perpendicular brims are inconfifent with itability. A fimicircular festion is the form which would produce the quickeft train of a river whofe expence and flope are given ; but the banks at B and D (fig. if.) would crumble in, and lic at the bottom, where their horizontal furface would fecure them from farther change. The bed will acquire the form \(G \subset F\), of equal fection, but greater width, and with brims lefs fhelving. The proportion of the velocities at \(A\) and \(c\) may be the fame with that of the velocities at \(A\) and \(C\); but the velccity at \(G\) and \(F\) will be lefs than it was formerly at \(\mathrm{B}, \mathrm{C}\), or D ; and the velocity in any intermediate point E , being fomewhat between thoie at \(F\) and \(c\), mult be leis than it was in any intermediate point of the femicircular bed. The velocities will therefore decreafe along the border from \(c\) towards \(G\) and \(F\), and the fteepnefs of the border will augment at the fame time, till, in every point of the new border GcF , thefe two circumftances will be fo adjufted that the neceffary equilibrium is eftablifhed.

The fame thing mult happen in our trapezium. The flope of the brims may be exact, and will be retained; it will, however, be too great anywhere below, where the velocity is greater, and the fides will be worn away till the banks are undermined and crumble down, and the river will maintain its fection by increafing its width. In fhort, no border made op of ftraight lines is confiftent with that gradation of velocity which will take place whenever we depart from a femicircular form. And we accordingly fee, that in all natural channels the feelion has a curvilineal border, with the flope increafing gradualiy from the bottom to the brim.

Thefe obfervations will enable us to underfand how nature operates when the inequality of furface or of tenacity obliges the current to change its direction, and the river forms an elbow.

Suppofing always that the difcharge continues the fame, and that the mean velocity is either preferved or
refored, the following conditions are neceffary for a Theory. permanent regimen.
r. The depth of water mult be greater in the elbow Conditions than anywhere elfe. hecefary
2. The main fream, after having fruck the corcave for a perbank, milt be reflected in an equal angle, and muit then manent rebe in the direction of the next reach of the river:
3. The angle of incidence muit be proportioned to the tenacity of the foil.
4. There muft be in the elbow an increafe of fiope, or of head of water, capable of overcoming the refiftance occafioned by the elbow.
The reafouablenefs, at lealt, of thefe conditions will appear from the following confiderations.
1. It is certain that force is expended in producing Reafon3this change of direction in a channel which by fuppofi- blenefs of tion diminiflas the current. The diminution arifing thefe confrom any cauie which can be compared with friction muft be greater when the ftream is directed againft one of the banks. It may be very difficult to fate the proportion, and it would occupy too much of our time to attempt it ; but it is fufficient that we be convinced that the retardation is greater in this cale. We fee no caufe to increafe the mean velocity in the elbow, and we muit therefore conclude that it is diminifhed. But we are fuppufing that the difcharge continues the fame; the fection muft therefore augment, or the channel increafe its tranfverfe dimenfions. The only queftion is, In what manner it does this, and what change of form does it affer, and what form is competent to the final equilibrium and the confequent permanency of the bed? Here there is much room for conjecture. Mr Buat reafons as follows. If we fuppofe that the points \(B\) and \(C\) (fig. 15.) continue on a level, and that the points \(H\) and \(I\) at the beginning of the next reach are alfo on a level, it is an ineritable confequence that the fope along CMI muft be greater than along BEH, becaufe the depreffion of \(H\) below \(B\) is equal to that of I below C , and BEH is longer than CMI. Therefore the velocity along the convex bark CMI munt be greater than along BEH. There may even be a ftagnation and an eddy in the contrary direction along the concave bank. Therefore, if the form of the fection were the fame as up the flream, the fides could not fland on the convex bank. When therefore the fectinn has attained a permanent form, and the banks are again in equilibrio with the adion of the current, the conver bank muft be much flatter than the concave. If the water is really ftill en the concave bank, that bank will be abfolutely perpendicular; nay, may overhang.-According. ly this fate of things is matter of daily obfervation, and jultifies our reafoning, and entilles us to fay, that this is the nature of the internal motion of the filaments which we cannot diftinelly ebferve. The water moves moft rapidly along the convex bank, and the thread of the Aream is neareft to this fide. Reafoning in this way, the fection, which we may fuppofe to have been originally of the form \(\mathrm{M} b a \mathrm{E}\) (fig. 16.) affumes the fhape MBAE.
2. Without prefuming to know the mechanirm of the internal motions of fluids, we know that fuperficial waves are reflected precifely as if they were elaltic bodies, making the angles of incidence and refiection equal. In as far therefore as the fuperficial wave is concerned in the operaion, Mr Buat's fecond poftion is juft.

The fermarency of the nest rach reguires that its avis thall be in the direttion of the line EP which makes the sugte CLIP=FEN. If the next reach F:a, t:e diraii in E(), MR, the ware reflectal in the lue ES will wit on the bank at \(S\), and will be rethened in the line \(5 \%\), and work agatin on the oppofite bank at 7 . We Enow that the tiect of the fuperlicial motion is agene in dentopin. tie bauks of canats. So far theretore Mr But is right. We cannt thy with at y precifion or centate é low the whinns of the unde: fildments are montifisd; but "e know mo reabon fir not exiending tu the un ter film nemts what appears fo proL. bre widh refpect to the firtace water.
3. The thirl politi \(n\) is no lets evident. We do not kniw the mude of action of the water on the bank; but our gener,t rintoms on this tubject, contirmed by common experience, tell the that the more obliguty a llrenn of water beats o:l any bank, the lets it tends to undmine it or wall it away. A lliff and cohetive foil therefore will iutler no more lrum being almolt rerpendiculanly buffeted by a fream than a friable fand would futfer from water gliding along its face. Mr Buat thinks, from experience, that a clay bank is not feafibly affected till the angle \(\operatorname{IEE}\) is abuat \(3^{6}\) degres.
4. Since ticre are caufes of retardation, and we nill fuppofe that the difcharge is kept up, and that the mean velocty, whieh had been diminithed by the enlargement of the fection, is again reltored, we muft grant that there is provided, in the mechanifm of thefe motion, an accelerating force adequate to this effect. There can be no aciclerating furce in an open fream but the fuperficial flope. In the prefent cale it is undoubrediy fo; becaufe by the deepening of the bottom where there is an elbow in the ftream, we have of neeclity a counter Alope. Now, all this head of water, which muft produce the augmentation of velocity in that part of the ftream which ranges roul the convex bauls, will arife from the check which the water gets from the concave bank. 'This occafions a gorge or fiwell up the ftream, enlarges a litule the feation at BLC ; and this, by the principle of uniform motion, will augment all the velocities, deepen the channel, and put every thing again into its train as foon as the water gets into the next reach. 'The water at the bottum of this baton has very little motion, but it defends the bottom by this very circumftance.

Such are the notions which Mr de Buat entertains of this part of the mechanifm of running waters. We cannot fay that they are very fatisfatory, and they are very oppofite to the opinions commonly entertained on the fubjeet. Moft perfons think that the motion is mutt rapid and turbulent on the fide of the concave bank, and that it is owing to this that the bank is wornaway till it become perpendicular, and that the oppofite bank is Alat , becaufe it has not been gnawed away in this manner. With refpeet to this general view of the matter, there perfons may be in the right; and when a flredm is turned into a crooked and yielding channel for the firt time, this is its manner of astion. But Mr Buat's ains is to inveltigate the circumfances which obtain in the cafe of a regimen; and in this view he is undoubtedly right as to the facts, though his mode of accounting for thefe fats may be erroncous. And as
this is the only ufeful view to be taken of the fubljeet, it ought chiefly to be attended to in all our attempts to precure R.wility to the bed of a river, without the expentive helps of matomry, \&e. If nee attenpt to fecure permanency by deepening on the infide it the elbow, our bank will undonbred.y crumble down, diminifh the paffage, and necatiun a more violent at on on the hollow bank. The motl effequal nican of fecurity is 1 enlarge the fettion: and if we du this on the infide banl, we muit du it by widening the Itream very much, that we may give a very floping bark. Our attention is commonly drath to it when the hollow bank is giving way, and with a view to thop the ravages of the flream. Things are not now in a tate of permatnency, but natue is working in her own way to bring it about. This may not fuit our purpore, and we mult thwat her. The phenomena which we then obferve are irequently very unlike to thofe deferibed in the preceding paragraphs. We fee a violent nambling motion in the frean towards the hollow bank. We fee an evident accumulation of water on that fide, and the puint B is frequently higher than C . 'This regorging of the water extends to tome diftance, and is of iffelf a caule of greater velocity, and contributes, like a head of itagnant waser, to force the ftream through the bend, and to deepen the bottom. This is clearly the cafe when the velocity is excelive, and the hollow bank able to abide the fhock. In this lituation the water thus heaped up efcapes where it beit can; and as the water, obftueted by an obflacle put in its way, efcapes by the fides, and there has its velocity increafed, fo here the water gorged up againt the hollow bank fiwells over towards the oppolite fide, and paffes round the convex bank with an increafed velocity. It depends much on the adjultment between the velocity and confequent accumulation, and the breadth of the ftream and the angle of the elbow, whether this augmentation of velocity fhall reach the convex bank; and we fometimes fee the motion very languid in that place, and even depofitions of mud and fand are made there. The whole phenomena are too complicated to be accurately deferibed in general terms, even in the cafe of perfect regimen : for this regimen is relative to the confitence of the channel ; and when this is very great, the motions may be moft viol.nt in every quarter. But the preceding oblervations are if importance, becaufe they relate to ordinary cafes and to ordmary channels.

It is evident, from Mr Buat's fecond pofition, that the proper form of an elbow depends on the breadth of the liream as well as on the radius of curvature, and that every angle of eibrw will require a certain proportion between the width of the river and the radius of the fweep. Mr Buas gives rulc, and formula for all thefe purpofes, and thows that in une fiweep there may be more than one reflection or rebound. It is needleds to enlarge on this matter of mere genmetrical difeuffion. It is with the view of enabling the engineer to trace the windings of a siver in fuch a manner that there fhall be no tebounds which thall direat the Itream againgt the fides, but preferve it always in the axis of every reach. This is of conlequence, even when the bends of the river are to be fecurest by mafonry or piling; for we have feen the neceffity of increating the feetion, and the tendency which the waters have to deepen the channel on that fide where the rcbound is made. This tends to undermine our defences, and oblige us to give them deeper and more fulid toundations in fuch places. But any perfon accullomed to the ufe of the icale and compalfes will torm to himfulf rules of practice equaily furc and more expeditious than Mr de Buat's formula.

ROI
Refiltanc caufed by an elhow, and mode of nver coming it.

We proceed, therefire, to what is more to our purpofe, the confideration of the refiltance caufed by an elbow, an the methods of providing a torce capable of overcoming it. We have already taken notice of the felutary confequences arifing from the rambling courfe of rivers, inafmuch as it more effectually fpreads them over the face of a country. It is no let's beneficial by diminifling their velocity. 'This it docs both by lengthening their courfe, which diminithes the declivity, and by the very refifance which they meet with at every bend. We derive the chicf advantages from our rivers, when they no longer thoot their way, from precipice, to precipice, loaded with mud and fand, but peaceably roll alung their clear waters, purified during their gentler courfe, and offer themfelves for all the purpofes of pafturage, agriculture, and navigation. The more a river winds its way round the foot of the hills, the more is the refiftance of its bed multiplied ; the morc obftacles it meets with in its way from its fource to the fea, the more moderate is its velocity; and inftead of tearing up the very bowels of the earth, and digging for itfelf a deep trough, along which it fweeps rocks and rooted up trees, it Hows with majeftic pace even with the furlace of our cultivated grounds, which it embellifhes and fertilizes.

We may with fafety proceed on the fuppofition, that the force neceflary for overcoming the refiftance arifing from a rebound is as the fquare of the velocity; and it is reafonable to fuppofe it proportional to the fquare of the fine of the angle of incidence and this for the reafons given for adopting this meafure of the general REsist. Ance of Fluids. It cannot, however, claim a greater confidence here than in that application; and it has been fhown in that arricle with what uncertainty and limitations it mult be received. We leave it to our readers to adopt either this or the fimple ratio of the fines, and Thall abide by the duplicate ratio with Mr Buat, becaufe it appears by his experiments that this law is very exactly obferved in tubes in inchnations nut exceeding 40; wherens it is in thefe fmall angles that the application to the general refintance of fuids, is moft in ault. But the correction is very fimple, if this value thall he foind erroneous. There can be little doubt that the force neceffary for overcoming the refiflance will increafe asthe numberof rebounds.- Therefore we may exprefsthe refiftance, in general, by the formiuis \(r=\frac{V^{2} s^{2} n}{m}\); where - is the refiftance, \(V\) the mean velocity of the frean, \(s\) the fine of the angle of incidence, \(n\) the number of cqual rebounds (that is, having equal angles of incidence), and \(n\) is a 14 mber to be determined by experiment. Mr de Bat made many experiments on the refizance occafioned by the bendings of pipes, none of which differed from the refiut of the above formula above one part in twelve; and he concludes, that the refiftance to one bend may be eftimated at \(\frac{V^{3} s^{3}}{3000}\). The experiment was in this form: A pipe of 1 inch diameter, and 10 feet long, was formed with sorcVol. XVI.
bounds of \(36^{\circ}\) each. A head of water was applied to if , which gave the water a velocity of fix feet per focond. Another pipe of the fame dianmeter and le ngut, but without any bendings, was fubjected to a preffure of a head of water, which was increafed till the velo. city of efllux was alfo fir feet per fccond. 'The addiional head of water was \(5 \frac{2}{10}\) inches. Another of the fame diameter and length, having one bend of \(24^{\circ} 34^{\prime}\), and runring 85 iuches pir fecond, was compared with a Araight pipe having the fame vclocity, and the difference of the heads of water was \(\frac{37}{105}\) of an inch. A computation from thefe two experiments will give the above refult, or in Englifla mealure \(r=\frac{V^{2} s^{2}}{3200}\) very nearly. It is probable that this meafure of the refiftance is too great; for the pipe was of uniform diametcr even in the bends: whereas in a river properly formed, whacre the regimen is exact, the capacity of the fection of the bend is increafed.

The application of this theory to inclined tubes and to open freams is very obvious, and very ligitimate and fafe. Let AB (fig. 17.) be the whole height of the refervoir A B I K, and BC the horizontal length of a pipe, containing any number of rebounds, equal or unequal, but all regnlar, that is, contructed according to the conditions formerly mentioned. The whole head of water fhould be conceived as performing, or as divided into portions which perform, three different offices.One portion, \(A D=\frac{V^{3}}{505}\), impels the water into the entry of the pipe with the velocity with which it realiy mores in it ; another portion EB is in equiiibrio with the refiftances arifing from the mere length of the pipe expanded into a fraight line; and the third portion DE ferves to overcome the refiftance of the bends. If, therefore, we draw the horizontal line BC, and, taking the pipe BC out of its place, put it in the pofition DH, with its mouth C in H , fo that DH is equal to BC , the water will have the fame velocity in it that it had beforc. N.B. For greater fimplicity of argument, we may fuppofe that when the pipe was inferted at \(B\), its bends lay all in a horizontal plane, and that when it is inferted at \(D\), the plane in which all its bends lie flopes only in the direction DH , and is perpendicular to the plane of the figure. We repeat it, the watcr will have the fame velocity in the pipes \(B C\) and DH , and the refiftances will be overcome. If we now prolong the pipe DH towards \(L\) to any diftance, repeating continually the fame bendings in a feries of lengths, eacle equal to DH , the motion will be continued with the velocity correfponding to the preffure of the column AD ; becaufe the declivity of the pipe is augmented in each Iength equsl to DH , bs a quantity precifely fufficient for overcoming all the refiftances in that length; and the true flope in thefe cafes is BE + ED, divided by the expanded length of the pipe BC or DH.

The analogy which we were enabled to eftablifh between the uniform motion or the train of pipes and of open Atreams, entitles us now to fay, that when a river has bendings, which are regularly repeated at equal intervals, its flope is compounded of the flope which is neceffary for overcoming the refiftance of a fraight channel of its whole expanded length, agreeably to Oo
the

Theurv. the formula for uniform motior, and of the flope which \(\rightarrow\) is necelfary for overconing the rctillance arifing from its bendings alone.

Thus, let there be a river which, in the expanded courfe of 6000 fathoms, has 10 elbows. each of which has \(30^{\circ}\) of rebound; and let its mean velocity be 20 inches in a fecond. If we would learn its whole ilope in this 6000 fathoms, we muft firth find (by the formula of uniform motion) the flupe s which will produce the wlocity of 20 inches in a ltraight river of this leneth, fegion, and mean depih. Suppoie this to be
xrobor or 20 inches in this whole length. We muft then find (by the formula \(\frac{V^{3} \operatorname{Sin}^{3}}{32 C 0}\) ) the flure neceffary for overcoming the refiltance of 10 rebounds of \(30^{\circ}\) each. This we thall find to be \(6 \frac{1}{T}\) inches in the 6000 fathoms. Therefore the river mull have a flope of \(26 \frac{2}{\frac{3}{3}}\) inches in 6000 fathoms, or Tr! produce the fame velocity which 20 inches, or zT' \({ }^{\prime}\) ©s would do in a Atraight running siver of the fame length.

\section*{Partil. IR ACTICAL INFERENCES.}

HAVING thus eflablifice a thenry of a mof important part of hydraulice, which may be confided in as a juft reprefentation of nature's procedure, we thall apply it to the examination of the chicf refults of every thing which art has contrived for limiting the operations of nature, or modifying them fo as 10 fivit our particular vicws. Trulting to the detail which we have given of the conmeting principles, and the chicf circumfances which co-operatcin producing the oftentible effect; and fuppofing that fuch of our acaders as are interefted in this fubjeet will not thinh it too much trouble to make the applications in the fame detail; we flall content ourfelves with merely printing out the Meps of the procefs, and howing their foundation in the theors itifelf: and frequently, in place of the direct ana-
lyfis which the theory enables us to employ for the folution of the problems, we fhall recommend a procefs of approximation by trial and correction, fufficiently accurate, and more within the reach of practical engineers. We are naturally led to confider in order the following articles.
1. The effects of permanent additions of every kind to the waters of a river, and the moft effectual methods of preventing or removing inundations.
2. The effetts of weirs, bars, fluices, and keeps of every kiad, for raifing the farface of a river; and the fimilar effects of bridges, piers, and cvery thing which contrdets the fection of the itream.
3. The nature of canals; how they differ from rivers in refpen of origin, difcharge, and regimen, and what conditions are necelfary for their moft perfect conftruction.
t. Canals for draining land, and drafts or canals of detivation from the main Atram. The principles of their conftralion, fo that they may fuit their intended purpe fes, and the change which they produce on the main lleam, both above and helow the point of derivation.
Of the effechs of ternanuent adililions to the waters of a river.
From what has been faid already, it appears that to every kind of foil or bed there cerreffends a certain velocity of cutrent, ton fmall to hurt it hy digging it up, and tno great to allow the depolition of the mateti.uls which it is carrying along. Suppofing this Fnowis for any particular lisuation, and the quantity of water which the channel muit of necefity difanarge, we may with to lears the fmallef flop= which munt be given to this ftream, that the waters may run with the sequired velocity. This fuggelts

Prob. I. Given the difcharge D of a 1 iver, and V its velocity of regimen: required the fmallelt flope \(s\), and the dimenfions ef its bed?

Since the flope muft be the finallef poffible, the bed mult have the form w!ich will give the greatert mean depth \(\alpha\), and thould therefore be the traperium formerly delcribed; and its area and perimeter are the fame with thofe of a rectangle whofe breadth is twice its height b. Thefc circumfances give us the equation \(\frac{1}{\mathrm{~V}}=2 h^{2}\). For the area of the fection is twice the fquare of the height, and the difcharge is the produkt of this area and the velocity. Therefore \(\sqrt{\frac{\bar{D}}{2 \mathrm{~V}}}=b\) and \(\sqrt{\frac{2 \mathrm{D}}{\mathrm{V}}}\) \(=\) the breadth \(b\).

The formula of uniform motion gives \(\sqrt{s}-\mathrm{L} \sqrt{s+1,6}\) \(=\frac{297(\sqrt{d}-0,1}{\sqrt{d}+0,}\). Intead of \(\sqrt{d}-0,1\), put its equal \(\sqrt{\frac{b}{2}} \longrightarrow 0,1\), and every thing being known in the fecond member of this equation, we eafily get the value of sby a few trials after the following manner. Suppofe that the fecond memher is equal to any number, fuch as 9. Firf fuppofe that \(\sqrt{3}\) is \(=9\). Then the hyperbolic logarithm of \(9+3,5\) or of 10,6 is 2,36 . Therefore we have \(\sqrt{ } /-1 / \sqrt{s+1,6}=9-2,36,=664\); whereas it fhould have been \(=9\). Therefore fay \(6,6+: 9=9: 12,2\) neally. Now fuppofe that \(\sqrt{ } s\) is \(=12,2\). Then I \(\overline{12,2+1,6}=\mathrm{L}, 13,8,=2,6125\) nearly, and \(12,2-2625\) is 9,575 , whereas it mould be 9 . Now we find that changing the value of \(\sqrt{5}\) from 9 to 12,2 has changed the anfwer from 6,64 to 9,575 , ar a change of 3,2 in our affumption has made a change of 2,935 in the anfiver, and has left an crior of 0.575 . Therefore fay \(2,935: 0,575\) \(=3,2: 0,62 \%\). Theri, tiking 0,628 fiom 12,2 , we have (for our next affumption or value of \(\sqrt{5}\) ) 11,572 . Now \(11,572+1,6=13,132\), and L 13,172 is 2,53 nearly. Now try this laft value \(11,57^{2--2,58}\) is 9,008 , fufficiently exact. This may ferve as a fpecimen of the thia's by which we may avoid an intricate analyfis.

I'rob. 1I. Given the difcharge 1) the nope \(s\), and the velocity V , of permanent reginen, to find the dimenfions of the bed.

Let \(x\) be the width, and \(y\) the depth of the channel, and \(S\) the areal of the fetion. This muf be \(=\frac{1)}{\bar{V}^{2}}\) which is iberefure \(=x y\). The denominator \(s\) being given,

Prsalical infurences.
given, we may make \(\sqrt{s}-L \sqrt{s+1,6}=\sqrt{ } B\), and the formula of mean velocity will give \(\mathrm{V}=\frac{297(\sqrt{d}-c, 1)}{\sqrt{B}}\) \(-0,3(\sqrt{d}-0,1)\), which we may exprefs thus: \(V=\) \((\sqrt{d}-0,1)\left(\frac{297}{\sqrt{B}}-0,3\right)\), which gires \(\frac{V}{\frac{297}{\sqrt{B}}-0,3}=\) \(\sqrt{d}-0,1)\); and finally, \(\frac{V}{\frac{297}{\sqrt{B}}-0,3}+0,1=\sqrt{ } \cdot \sqrt{l}\).

Having thas obtained whit we called the mean depth, we may fuppofe the fection rectangular. This gives \(d=\frac{x y}{x+2 y}\). Thus we have two cquations, \(\mathrm{S}=x y\) and \(d=\frac{x y}{x+2 y}\)
From which we obtain \(\left.x=\sqrt{\left(\frac{S}{2 d}\right)^{2}-2 S} \right\rvert\,+\frac{S}{2 d}\). And having the breadth \(x\) and area \(S\), we have \(y=\frac{S}{x}\) And then we may change this for the trapezium often mentioned.

Thefe are the chief problems on this part of the fubject, and they cnable us to aljuft the flope and chan. nel of a river which receives any number of fuccellive permanent additions by the influx of other freams. 'Ihis laft informs us of the rife which a new fupply will produce, becaufe the additional fupply will require additional dimenfions of the channel; and as this is not fuppofed to increafe in breadth, the addition will be in depth. The queftion may be propored in the following problem.

Prob. III. Given the llope s, the depth and the bafe of a rectangular bed (or a trapezium), and confequently the difcharge \(D\), to find how much the fec. tion will rife, if the difcharge be augmented by a given quantity.

Let \(b\) be the height after the augmentation, and \(w\) the width for the rectangular bed. We have in any unifurm current \(\sqrt{d}=\frac{\hat{V}}{\frac{297}{\sqrt{B}}-0,3}\) Raifing this to a fquare, and putting for \(d\) and V their values \(\frac{w b}{w+2 b}\) and \(\frac{\mathrm{D}}{w}\), and making \(\frac{297}{\sqrt{ } B}-0,3=K\), the equation becomes \(\frac{v b b}{\tau v+2 b}\) \(=\left(\frac{D}{\text { wh } K}+0, I\right)^{z} \quad\) Raifing the fecond member to a fquare, and reducing, we obtain a cubic equation, to be folved in the ufual manner.

But the folution would be cxtremely complicated. We maj obtain a very expeditious and exact approximation from this confideration, that a fmall change in one of the dimenfions of the feetion will produce a much greater change in the fection and the difcharge than in the mean depth \(d\). Having therefore augmented the unknown dimenfion, which is here the height, make ufe of this to form a new mean depth, and then the new cquation \(\sqrt{ } \bar{d}=\frac{\mathrm{D}}{w / 3\left(\frac{297}{\sqrt{D}}-0,3\right.}+c, 1\) will
give us another value of \(h\), which will rarely exceed the truth by \(\mathrm{T}^{1}\). 'This ferves (by the fame procefs) for finding another, which will comnonly be ufficiently exact. We thall illnftrate this bv an example.

Let there be a river whofe channel is a rectangle 150 feet wide and fix feet deep, and which difcharges 1500 cubie fiet of water per fecond, having a velocity of 20 inches, and Mope of \(\overline{\mathrm{T}} \frac{\mathrm{B}}{\mathrm{\delta}} \mathrm{\sigma}\), or about \(\frac{7}{\overline{1}}\) of an inch in 100 hithoms. How much will it rife if it receives ant addition which triples its difcharge ; and what will be its velocity?

If the velocity remained the fame, its depth would be tripled; but we know by the general formula that its velocity will be greatly increafed, and therefore its depth will not be tripled. Suppofe it to be doubled, and to become 12 feet. This will give \(d=10,3+483\), or \(124,13 S\) inches; then the equation \(\sqrt{\bar{d}}-0,1=\) \(\frac{\mathrm{D}}{w h\left(\frac{297}{\sqrt{13}}-0,3\right.}\), or \(b=\frac{\mathrm{D}}{w(\sqrt{d}-0,1)\left(\frac{297}{\sqrt{B}}-0,3\right)}\), and
in which we have \(\sqrt{ } \mathrm{B}=107,8, \mathrm{D}=4500 ; \sqrt{d}-\mathrm{C}, 1\) \(=11,0+17\), will give \(b=13,276\); whereas it thould have been I2. This fhows that our calculated value of \(d\) was too fmall. Let us therefore increafe the depiln by 0,9 , or make it 12,9 , and repeat the calculation. This will give us \(\sqrt{d}-0,1=11,3927\), and \(h=12,867\), inftead of 13,276 . Therefore augmenting our data 0,9 changes our anfwer 0,409 . If we fuppofe thefe fmall changes to retain their proportions, we nay conclude that if 12 be augmented by the quantity \(x \times 0,9\), the quantity 13,276 will diminifh by the quartity \(x \times 0,409\). Therefore, that the eftimated value of \(b\) may agree with the one which refults from the calcula. tion, we mult have \(12+x \times 0,9=13,276-x \times 0,409\). This will give \(x=\frac{1,276}{1,309},=0,9748\), and \(\times \times 0,9=0,8773\); and \(b=r 2,8773\). If we repeat the calculation with this value of \(b\), we thall find no change.

This value of \(b\) gives \(d=131,8836\) inches. If we now compute the new velocity by dividing the new difcharge 4500 by the new areat \(150 \times 12,8773\), we fhall find it to be 27,95 inches, in place of 20 , the former velocity.

We might have made a pretty exact firt allumption. by recollecting what was formerly oberved, that when the breadth is very great in proportion to the depth, the mean depth differs infenfibly from the real depth, or rather follows nearly the fame proportions, and that the velocities are proportional to the fquare roots of the depths. Call the firf difcharge \(d\), the height \(b\), and velocity \(v\), and let \(\mathrm{D}, \mathrm{H}\), and V , exprefs thefe things in their augmented Atate. We have \(v=\frac{d}{w \dot{h}}\) and \(\mathrm{V}=\frac{\mathrm{D}}{w \mathrm{H}}\), and \(\tau^{\prime}: \mathrm{V}=\frac{d}{b}: \frac{\mathrm{D}}{\mathrm{H}}\), and \(v^{2}: \mathrm{V}^{2}=\frac{d^{2}}{b^{2}}:\)
\(\frac{\mathrm{D}^{2}}{\mathrm{H}^{2}}\). But by this remark \(v^{2}: \mathrm{V}^{2}=b: \mathrm{H}\). Therefore \(b: \mathrm{H}=\frac{d^{2}}{b^{2}}: \frac{\mathrm{D}^{2}}{\mathrm{H}^{2}}\), and \(\frac{b \mathrm{D}^{2}}{\mathrm{H}^{3}}=\frac{\mathrm{H} d^{2}}{b^{2}}\), and \(b^{3} \mathrm{D}^{2}=\mathrm{H}^{3} d^{3}\), and \(d^{2}: D^{2}=b^{3}: \mathrm{H}^{3}\) (a ufeful theorem) and \(\mathrm{H}^{3}=\) \(\frac{b^{3} \mathrm{D}^{2}}{d^{2}}\), and \(\mathrm{H}=\sqrt[3]{\frac{b \mathrm{D}^{2}}{d^{2}}}=12,48\).

Or we might have made the fame affumption by the 002 remark

このニ R I V
pradied rem ir！a alo formerly made on this cafe，that the fquares Inferences of the difcharges are nearly as the cubes of the height， or \(1500^{2}:+500^{3}=6^{3}: 12,49^{3}\) ．

And in making thefe firft gueffes we flall do it more exactly，by recolleding that a certain variation of the mean depth \(d\) requires a greater variation of the height， and the increment will be to the height nearly as half H：e height to the width，as may cally be feen．＇There－ fore，if we add to \(12,+8\) it：\(\frac{6,2 \ddagger}{150}\) th part，or its 24 th part， viz． 0,52 ，we lave 13 for our firt affimption，exceeding the truth only an irch and a hall．We mention thefe cir－ cumftances，that thofe who are difpufed to apply thefe doctrines to the fulution of practical cales may be at no lofs when one occurs of which the regtar folution requires an intricate analydis．

It is evident that the inverfe of the foregning pro－ blems will thow the effects of enlarging the fection of a river，that is，will fhow how much its farface will be funk by any propofed enlargement of its bed．It is therefore ncedlefs to propole fuch problems in this place．Common fenfe directs us to make thefe enlargements in thole parts of the river where their effeet will be greateft，that is，where it is thallowett when its breadth greatly exceeds its depth，or where it is narrowelt（if its depth exceed the breadth，which is a very rare cale），or in general，where the flope is
the fmallett for a hort run．
The fame general principles direct us in the method of embankments，for the prevention of floods，by ena－ bling us to afcertain the heights necellary to be given to our banks．This will evidently depend，not only on the additional quantity of water which experience tells 11 s it river brings down during its frefhes，but alfo on the diftance at which we place the banks from the natural banks of the river．This is a point where miftaken economy frequently defeats its own purpofe．It we raife our embankment at fome diftance from the natural banks of the river，not only will a fmaller beight fut－ fice，and confequently a fmaller bafe，which will make a faving in the duplicate proportion of the height ；but our works will be fo much the ni re durable nearly，if not exactly，in the fame proportion．For by thus en－ larging the additional bed which we give to the fwol－ len river，we diminith its velocity almoft in the fame proportion that we enlarge its channel，and thus dimi－ nith its power of ruining our works．Except，there－ fore，in the cafe of a river whofe frefhes are loaded with tine fond to deltroy the eurl，it is always proper to place the cmbankment at a confiderable ditance from the natural banks．Placing them at nalf the breadth of the fream from its natural banks，will nearly double its channel ；and，except in the cafe now mentimed，the fpace thus detached froniour ficlds will afford excellent patture．

The limits of fuch a work as ours will not permit us to enter into ang detail on the method of embankment． It would require a volume to give inftructions as to the manner of lounding，railing，and fecuring the dykes which mut be railed，and a thoufand circumfances which muft be attended to．But a few general ob． fervations may be made，which naturally occur while we are confidering the manner in which a river works in fettling or altering its chanmel．

It muit horemarked，is the firf place，that the ri－Practical ver will rife higher when enbanked than it docs while Inferences． it was allowed to fpread；：nd it is by no means eafy to conclude to what height it will rite from the greateft height to which it has been obferved to rife in its floods． When at liberty to expand zeer a wide valley；then it could only rife till it overflowed with a thicknefs or depth of water lifficient to pinduce a motion back－ wards into the vall＝y quick enough to take off the wa－ ter as falt as it was fupplied；and we imaginc that a foot or two would tulfice in moft cafes．The beft way for a prudent engineer will be to obferve the utmoft rife remembered by the neighbours in come gorge，where the river cannot jpread out．Meafure the increaled fec－ tion in this place，and at the fame time recolled，that the water increales in a much greater proportion than the fection；becaute an increafe of the hydraulic mean depth produces an increate of velncity in the duplicate proportion of the depth nearly．But as this auymen． tation of velocity will obtain alío between the ensbank－ ments，it will be fulfiently cant to fuppole that the fection muft be increafed here nearly in the fame pro． portion as at the gorge already mentioned．Neglect－ ing this method of information，and segulating the height of our embankment by the agreaten fwell that las been oblerved in the plain，will affuredly make them too low，and render them totally ulelefs．

A line of embankment hould always be carricd on by a ftriat concert of the proprietors of both banks through its whole extent．A greedy proprictor，by ad－ vancing his own embanknent beyond that of his neigh－ bnurs，not only expoles himlelf to rifk by the work－ ing of the waters on the angles which this will pro－ duce，but expofes his neighbours alfo to danger，by nar． rowing the fection，and thereby railing the furface and increafing the velocity，and by turning the ftream athwast，and c：ufing it to fhoot againft the oppofite bank．The whole thonld be as much as pollible in a line ；and the genernl effect fhould be to make the courfe of the fream ilraighter than it was before．All bends fhould be nrade more gentle，by keeping the embank－ ment further from the river in all convex lines of the natural barik，and bringing it nearer where the bank is concave．Iras will greatly diminidh the action of the waters on the bonkment，and infire their duration． The fame maxim muft be followed in fencing any brook which dilcharges itfelf into the river．The bends gi－ ven at its nouth to the two lines of embankment thould be made jefs acute tian thofe of the natural brook，al－ though，by this means，two points of Jind are left out． And the opportunity thould be embraced of miking the dircetion of this iranferie broots more Il ping than before，that is，lefs athwart the direction of the river．

It is of great confequence to cover the outfide of the dyke with very compact turf clofely united．If it ad－ nit water，the interior part of the wall，which is always more porous，becomes drencled in water，and this wa－ ter acts with its fatical preflure，tending to burft the bank on the land－fide，and will quickly thift it from its feat．The utmolt care thould therefore be taken to make it and keep it perfectly tight．It fhould be a continued fine turf，and every bare fpot thould be care－ fully covered with frefl fojl；and rat holes mun be carcfully clofed up．

K I V E R.

Practical
\(\underbrace{\text { Inferences. }}\)
107 of the slope requires at the bend of a river and the contequences.

\section*{Of flraighting or changing the courfe of rivers.}

We have feen, that every bending of a river requires an additional lope in order to continue its train, or en. able, it to convey the fame quantity of water without dwelling in its bed. Therefore the effect of taking away any of there bends mut be to fink the waters of the river. It is proper, therefore, to have it in our power to eftimate the fe effects. It may be defirable to gain property, by taking away the fweeps of a very winding Stream. But this may be prejudicial, by defroying the navigation on fuch a river. It may aldo hurt the proprietors below, by increasing the velocity of the itream, which will expose them to the ritk of its overflowing, or of its deftroying its bed, and taking a new course. Or this increate of velocity may be inconfiftent with the regimen of the new channel, or at lealt require larger dimenfions than we fhould have given it if ignorant of this effect.

Our principles of uniform motion enable us to anfer every queftion of this kind which can occur ; and Mr de But propofes feveral problems to this effect. The regular folutions of them are complicated and difficult ; and we do not think them neceffary in this place, because they may all be folved in a manner not indeed fo elegant, bccaufe indirect, but abundantly accurate, and early to any perron familiar with thole which we have already confidered.

We caus take the exaf level across all there fweeps, and thus obtain the whole flope. We can meafure with accuracy the velocity in forme part of the channel which is molt remote from any bend, and where the channel itself thus the greaten regularity of form. This will give us the expence or difcharge of the river, and the mean depth connected with it. We can then examine whether this velocity is precifely fuch as is compartible with lability in the fraight courfe. If it is, it is evident that if we cut off the bends, the greater nope which this will produce will communicate to the wares a velocity incompatible with the regimen fruited to this foil, unless we enlarge the width of the fleam, that is unless we make the new channel more capacious than the old one. We mut now calculate the dimenfions of the channel which, with this increafed flope, will conduct the waters with the velocity that is neceflary. All this may be done by the foregoing problems; and we may eafieft accomplith this by Steps. First, fuppofe the bed the fame with the old one, and calculate the velocity for the increafed nope by the general formula. Then change one of the dimenfions of the channel, fo as to produce the velocity we want, which is a very fimple process. And in doing this, the object to be kept chiefly in view is not to make the new velocity fuck as will be incompatible with the lability of the new bed.

Having accomplifhed this frt purpose, we learn (in the very folution) how much hallower this channel with its greater lope will be than the former. while it difcharges all the waters. This diminution of depth mut increafe the flope and the velocity, and mut diminifh the depth of the river, above the place where the alteraton is to be made. How far it produces the le effects may be calculated by the general formula. We then fee whether the navigation will be hurt, either in the old river up the ftream, or in the new channel. It is

Plain that all the fe points cannot be reconciled. We may make the new channel fuch, that it hall leave a velocity compatible with flability, and that it fall not diminish the depth of the river up the Areami. But, having a greater flope, it mutt have a fmaller mean depth, and also a fmaller real depth, unless we make it of i very inconvenient form.

The fame things viewed in a different light, will flow us what depreffion of waters may be produced by rectiflying the courfe of a river in order to prevent its overflowing. And the process which we would recommend is the fame with the foregoing. We apprehend it to be quite needles to meafure the angles of rebound, in order to compute the nope which is employed for fend. ing the river through the bend, with a view to fuperrede this by fraighting the river. It is infinitely leafier and more exact to meafure the levels themfelves, and then we know the effect of removing them.

Nor need we follow Mr de Buat in folving problems fur diminifhing the lope and velocity, and deepening the channel of a river by bending its courfe. The expence of this would be in every cafe enormous; and the practices which we are jut going to enter upon afford infinitely eafier methods of accomplifhing all the purepoles which are to be gained by thee changes.
\[
\begin{gathered}
\text { Of Bars, Weirs, and Jetteys, for raijng the Surface of } \\
\text { Rivers. }
\end{gathered}
\]

We propose, under the article WATER-Works, to problems, 108 confider in fufficient practical detail all that relates to example;, the conflruction and mechanism of the le and other exec. tons in water; and we confine ourfelves, in this place, to the mere effect which they will produce on the current of the river.

We gave the name of weir or bar to a dam erected across a river for the purpose of railing its waters, whethe in order to take off a óraft for a mill or to deepen the channel. Before we can tell the effect which they will produce, we mut have a general rule for afcertaining the relation between the height of the water above the lip of the weir or bar, and the quantity of water which will flow over.

Firs, then, with refpect to a weir, reprefented in fig. 18. and fig. 18. \(n^{\circ}\) 2. The latter figure more refembles their ufual form, confining of a dam of folic masonry, or built of timber, properly fortified with hoars and banks. On the top is fit up a flong plankFR, called the wafteboard, or water, over which the water flows. This is brought to an accurate level, of the proper height. Such voiders are frequently made in the fide of a mill-courle, for letting the fuperfluous water run off. This is properly the WASTER, VOIDER: it is also called an offset. The fame observations will explain all thee different pieces of practice. The following queftions occur in course.

Prob. I. Given the length of an offset or waleboard, made in the farce of a refervoir of fagnant wa ter, and the depth of its lip under the horizontal fur. face of the water, to determine the difcharge, or the quantity of water which will run over in a fecond?

Let \(A B\) be the horizontal furface of the fill water, and \(F\) the lip of the waftebuard. Call the depth BF under the furface \(b\), and the length of the wafteboard \(/\). \(N\). B. The water is fuppofed to flow over into avothar baton or channel fo much lower than the furface:

thatial IfL of the watcr is lower, or at leaft not higher, huterence. thata I\%.

If the wa:er could be fupported at the height BF, IIF might be contidered as an orifice in the lide of a velfe!. In which cate, the dilehnge would be the fims as if the whole water wete flowing with the velucity aequired from the height \({ }_{y}^{3} \mathrm{BE}\), or \(\frac{4}{3} 4\). And if we luppow that there is no co traction at the orifice, the mem veloci:y would be \(\sqrt{2 g^{\frac{1}{4}} h,}=\sqrt{77^{2} \frac{4}{2} h}\), in Enclith inches per fecond. The arca of this onitice is \(/ \mathrm{h}\). Therefore the difobrge would be \(1 /: \sqrt{752 \frac{1}{5}} 1\), all being meafured in inehes. This is the ufial theory ; but it is \(n\) it an exact reprefertation of the manter in \(w^{2}\) isch the ctlus: really lappens. 'lhe water camot remain at the height HF ; but in drawing towarls the wafteboard from all fides, it Jorms a conver ludface AlII, fothat the point I, where the vertical draton from tle edge of the watteboard meets the curve, is confiderab:y lower than ll. But as all the mats above \(F\) is fuppoled perfestly fluid, the preffure of tive incumbent water is propagated, in the opinion of Mr de Buat, th the tilament falling over at \(F\) without any diminution. The lame may te faid of any filanent between Fand I. Lach tends, therefore, to muve in the fame manner as ii it were really inpelled though an orifice in its place. "l'berefore the motions through every part of the line or fiare IF are the fame as if the water were efcaping througit an orifice \(I F\), made by a fluice let down on the water, and kecping up the water of the tefervoir os the level Ab. It is beyond a doubt (fays he) that the lieight IF nuft depend on the whole height \(B F\), and that there muf be a certain determined proportion between then. He does not attempt to determine this proportion theoretically, but fays, that his experiments alcestain it with great precifion to be the proportion of ene to two, or that IF is always one-half of BF. He iijs, huwever, that this determination was not by an inmediate and direet meafurement; he concluded it from the comparion of the quantities of water difcharged under different heights of the water in the reiervoit.

We cannot help thinking that this reafoning is very dele?tive in feveral particulars. It cannot be inferred, fiom the laws of hydrollatical preflure, that the filament at I is preffed forward with all the weight of the c.lumn BI. The paticle I is really at the furface; and conldering it as making part of the furface of a running Itream, it is fubjested to hardly any preffure, any more than the particles on the furface of a cup of water held in the hand, while it is carried round the aris of thee earth and round the fun. Reafoning according to his own principles, and availing himfelf of his own difcovery, he fhould fay, that the particle at I has an accelerating force depending on its flope only; and then te fhonld have endeavoured to afcertain this tleps. The motion of the particle at I has no immeDiate connedion with the preffure of the column BI; and if it had, the mution would be extremely different from what it is: for this prellure alone would give it the velocity which Mr Buat afigns it. Now it is al. read paffing through the point I with the velocity which it has acquired in defcending aleng the curve AI; and this is the real flate of the catic. The particles are palling through with a velocity already ac-
quired by a doping current ; and they are accelcrated Pracieal by the hydroftatical prethase of the watc: :bove them. \(\underbrace{\text { Infereneer. }}\) The internsl mechanitm of thefe motions is infinitely more complex than Mre liuat here fuppoles; and on this fuppolition, he very nearly abando.is the theory which he has fo ingenioully catablifhed, and adopts the theo. ry of Gugliclmini which he had exploded. At the lame time, we thonk that he is not much miftahen when he afferts, that the motions are nearly the lame as if a Auice had been let down from the durface to I. For the filament which paffes at I has been gliding down a curved farface, and has not been cxpofed to any friction. It is perhaps the very cafe of hyd.anlics, where the obitructions are the fina lelt ; and we thould therefore expect that its motion will be the leaft retarded.

We have therefore no helitation in faying, that the filament at I is in the very tate of motion which the then. ry would allign to it it it were pafling under a lluice, as Mr Buat fuppofes. And with refuect to the inferior flaments, wihout attempting the very difficult tafk of inveftigating their motions, we fhall juft firy, that we do not fee any reafon for fuppofing that they will move flower than our author fuppoles. Therefore, though we reject his thcory, we admit his experimental propoGtion in general; that is, we admit that the subole water which pafles through the plane IF moves with the velocity (though not in the fame direction) with which it would have run through a flaice of the fame depth: and we may proceed with his determination of the quantity of water difcharged.

If we make BC the axis of a parabola BEGH, the velocitics of the flaments pafling at I and \(F\) will be reprefented by the ordinates 1 E and FG, and the difcharge by the area IEGF. This allows a very neat folution of the problem. Let the quantity difcharged per fecond be \(D\), and let the whole height \(B F\) be \(b\). Let \(2 G\) be the qquantity by which we mult divide the fquare of the mean velocity, in order to have the producing height. This will be lefs than \(2 g\), the acceleration of gravity, on account of the convergency at the fides and the tendency to convergence at the lip F . We formerly gave for its meafure \(7^{26}\) inches, inftead of \(77^{2}\), and faid that the inches difcharged per fecond from an orifice of one inch were 26,49 , inftead of 27,-8. Let \(x\) be the difance of any filament from tire horizontal line AB. An element of the orifice, therefore, (for we may give it this name) is \(l \therefore\). The velocity of this element is \(\sqrt{2 G x}\), or \(\sqrt{2 G} \times \sqrt{ } \times\). The difcharge from it is \(\int \sqrt{2 G} x^{\frac{1}{2}} x\), and the fluent of this, or D\()=f l \sqrt{2 \mathrm{G}} \cdot x^{\frac{1}{2}} x\), which is \(\frac{2}{3} l \sqrt{2 \mathrm{G}} x^{\frac{3}{2}}+\mathrm{C}\). To determine the conftant quantity C , obferve that Mr de Buat found by experiment that BI was in all cale; \(\frac{1}{2} \mathrm{BF}\). Thereforc D muf be nothing when \(x=\frac{1}{2} b ;\) confequently \(C=-\frac{2}{3} l \sqrt{2 G}\left(\frac{b}{2}\right)^{\frac{3}{2}}\), and the com. pleted Auent, will be \(\mathrm{D}=\frac{2}{3} l \sqrt{2} \mathrm{G}\left(x^{\frac{3}{2}}-\left(\frac{h}{2}\right)^{\frac{3}{2}}\right)\).

Now make \(x=b\), and we have
\(\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{Gr}}\left(b^{\frac{3}{2}}-\left(\frac{b}{2}\right)^{\frac{3}{2}}\right)=\frac{5}{3} l \sqrt{2 \mathrm{G}}\left(1-\left(\frac{1}{5}\right)^{\frac{3}{3}}\right) b^{\frac{3}{2}}\). But 1 - ( \(\frac{3}{2}\) ) \(\frac{3}{2}=0,6+645\), and \(\frac{2}{3}\) of this is 0,435 : Therefore, finally,

If we now put 26,49 or \(26 \frac{1}{2}\) for \(\sqrt{2 \mathrm{G}}\), or the velocity with which a head of water of one inch will impel the water over a weir, and multiply this by 0,431, we get the following quantity 11,4172 , or, in numbers of eafy recollcction, \(1{ }_{1}^{\frac{1}{2}}\), for the cubic incles of water per fecond, which runs over cvery inch of a wafteboard when the edge of it is one inch below the furface of the reftrvoir; and this mult be multiplied by \(b \frac{1}{2}\), or by the fquare root of the cube of the head of water. Thus let the edge of the wafteboard be four inclies below the furface of the water. The cube of this is \(6_{4}\), of which the fquare root is eight. Therefore a waltebnard of this depth under the furface, and three feet long, will difcharge every fecond \(8 \times 36 \times 11 \frac{1}{2}\) cubic inches of water, or \(1^{\frac{8}{8}}\) cubic feet, Enclifh meafure.

The following comparions will fow how much this theory may be depended on. Col. I. Thows the depth of the edge of the board under the furface; z. fhows the difcharge by theory; and, 3 . the difcharge actually obferved. The length of the board was \(18 \frac{1}{3}\) inches. N. B. The numbers in Mr Buat's experiments are here reduced to Engliih meafure.
\begin{tabular}{cccc} 
D. & D. Thecr. & D. Exp. & E. \\
1,778 & 506 & 524 & 28,98 \\
3,199 & 1222 & 1218 & 69,83 \\
4,665 & 2153 & 2155 & 123,03 \\
6,753 & 3750 & 3771 & 214,29
\end{tabular}

The laft column is the cubic inches difcharged in a fecond by each inch of the watteboard. The correfpondence is undoubtedly very great. The greateft error is in the firft, which may be attributed to a much fmaller lateral contraction under fo fmall a head of water.

But it muft be remarked, that the calculation proceeds on two fuppofitions. The height FI is fuppofed \(\frac{3}{2}\) of BI ; and \(2_{2} \mathrm{G}\) is fuppofed \(7=6\). It is evident, that by increafing the one and diminifhing the other, nearly the lame antwers may be produced, unlefs much greater variations of \(h\) be examined. Both of thefe quantities are ma:ters of confiderable uncertainty, particularly the firf; and it muft be farther remarked, that this was not meafured, but deduced from the uniformity of the experiments. We prefume that Mr Buat tried various valucs of \(G\), till he found one which gave the ratios of difcharge wlich he obferved. We beg leave to obferve, that in a fet of numerous experiments which he had acceis to examine, \(13 I\) was uniformly much lefs than \(\frac{7}{2}\); it was very nearly \(\frac{2}{7}\) : and the quantity difcharged was greater than what would refult from Mr Buat's calculation. It was farther obferved, that IF depended very much on the form of the watteboard. When it was a very thin board of confidcrable depth, IF was very confiderably greater than if the board was thick, or narrow, and fet on the top of a broad dam-head, as in fig. is. \(11^{\circ} 2\).

It may be proper to give the formula a form which will corrspond to any ratio which experience may difcover between BF and \(I F\). Thus, let BI be \(\frac{m}{n} \mathrm{BF}\). The formula will be \(\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(\mathrm{I}-\left(\frac{m}{n}\right)^{\frac{1}{2}}\right)^{b \frac{3}{2}}\)

It is hoped that this and fome other fundamental facts in practical hycraulics will foon be determined by
accurate experiments. The honourable Board for Fifi- Practical eries and Improvements in Scotland have allotted a fum \(\underbrace{\text { Inferences. }}\) of money for making the neceflary experiments, and the refults will be publifhed by their authority. Meantime, this theory of Mr de Buat is of great value to the practical engineer, who at prefent mult content himielf with a very vague conjecture, or take the calculation of the erroneous theory of Guglielmini. By that theory, the board of three feet, at the depth of four inches, fhould difcharge nearly \(3 \frac{1}{\mathrm{r}}\) cubic feet per fecond, which is almof double of what it really delivers.

We prefume, therefore, that the following table will be acceptable to practical engineers, who are not familiar with fuch computations. It contains, in the firft colum, the depth in Englifh inches from the furface of the ftagnant water of a refervoir to the edge of the wateboard. The fecond column is the cubic feet of water difcharged in a minute by every inch of the wafte. board.
\begin{tabular}{cc} 
Depth. & Difcharge. \\
1 & 0,403 \\
2 & 1,140 \\
3 & 2,095 \\
4 & 3,225 \\
5 & 4,507 \\
6 & 5,925 \\
7 & 7,466 \\
8 & 9,122 \\
9 & 10,884 \\
10 & 12,748 \\
11 & \(1+, 707\) \\
12 & 16,758 \\
13 & 18,895 \\
14 & 21,117 \\
15 & 23,419 \\
16 & 25,800 \\
17 & 28,258 \\
18 & 30,786
\end{tabular}

When the depth does not exceed four inches, it will not be exact enough to take proportional parts for the fractions of an inch. The following method is exact.

If they be odd quarters of an inch, lonk in the table for as many inches as the deptl contains quarters, and take the eighth part of the anfiver. Thus, for \(3^{\frac{3}{7}}\) inches, take the eighth part of 23,419 , which correfponds to 15 inches. Tbis is 2,927 .

If the walteboard is not on the face of a dam, but in a running fream, we muft augment the difcharge by multiplying the fection by the velocity of the fream. But this correation can feldom occur in prattice; becaufe, in this cafe, the difcharge is previcufly known; and it is \(b\) that we want ; which is the objest of the next problem.

We only beg leave to add, that the experiments which we mention as having been already made in this country, give a refult fomewhat grea:er than this table, viz. about \(\mathrm{r}^{\frac{1}{0}}\). Therefore, having obtained the anfirer by this table, add to it its 16 th part, and we apprehend that it will be extremely near the truth.
When, on the other hand, we knov: the difcharge over a wafteboard, we can tell the depth of its edge under the furface of the ftagnant water of the refervoir, becaufe we have \(b=\left(\frac{D}{I \frac{1}{2}!}\right)^{\frac{2}{3}}\) very nearly. hiferenses

We are now in a conlition to folve the problem serpecting a weir acrof a siver.

Pans. 11 . Ihas difcharge and feation of a river being given, it is requined to determine how much the waters wi:l be raifed by at weir of the whole beadil of the river, difharging the water with a clear fall, that \(i\), the furface of the water in the lower channel being below the edge of the weir?

In this cate we have \(2 \mathrm{G}=745\) nearly, becaufe there will be no contration at the fides when the weir is the whole breadth of the river. But further, the water is not now flagnant, but moving with the velocity 1), \(S\) being the feetion of the river.

Therefore let a be the height of the weir from the bottum of the river, and if the height of the water above the ed ge of the weir. W'e have the velocity with which the water approaches the weir \(=\frac{D}{(a+b)^{\prime}}\)
I being the length of the weir or breadth of the river. Thercfore the height producing the primary mean velocity is \(\left(\frac{D}{\sqrt{2 g}(6+b)}\right)^{2}\). The equation given a litule aro will give \(b=\left(\frac{D}{0,431 / \sqrt{2 G}}\right) \frac{2}{T}\), when the water above the weir is Itagnant. Therefore, when it is already moving with the velocity \(\frac{\mathrm{D}}{l a+b}\), we flall have \(h=\left(\frac{\mathrm{D}}{0,+3 \mathrm{I} \sqrt{2 \mathrm{G}}}\right)^{\frac{2}{3}}-\left(\frac{\mathrm{D}}{\sqrt{2} \mathrm{G}(a+h}\right)^{2}\).
would he very troublefome to folve this equation regularly, becaufe the unknown quantity \(b\) is found in the fecond term of the anfwer. But we know that the height producing the velocity above the weir is very fmall in comparifon of \(b\) and of \(a\), and, if only eftimated roughly, will make a very infenfible change in the value of \(b\); and, by repeating the operation, we can corren this value, and obtain \(b\) to any degree of exactnefs.

To illuftrate this by an example. Suppofe a river, the fextion of whofe fream is 150 feet, and that it difcharges \(17+\) cubic feet of water in a fecond ; how much wiil the waters of this river be raifed by a weir of the fame width, and 3 feet high ?

Suppofe the width to be 50 fect. This will give 3 feet for the depth ; and we fee that the water will h.ive a clear fall, becaufe the lowe: fleam will be the fame as before.

The fettion being 150 feet, and the difcharge 174 ,
 nearly, which requires the height of \(\frac{x}{4}\) of an inch very nearly. This may be taken for the fecond term of the value of \(h\). Therefore \(h=\left(\frac{\mathrm{D}}{0,431 \sqrt{2 \mathrm{G}!}}\right)^{\frac{2}{3}}\) — \(\frac{7}{7}\). Now \(\sqrt{2 \mathrm{G}}\) is, in the prefent cafe, \(=27,3 \times 3 ; l\) is 600 , and 1) is \(174 \times 1728,=300672\). Thercfore \(b=12,192\) \(-0,25,=11,242\). No corten this value of \(b\), by correnting the fecond term, which is \(\frac{7}{4}\) of an inch, inftead of \(\left(\frac{D}{\sqrt{2 g!(a+b)}}\right)^{\prime}\), or 0,141 . This will give us \(h=12,19^{2}-0,141,=12,051\), differing from the firlt value about r's of an inch. It is needlefs to carry
the approximation farther. Thuts we fee that a weir, which dams up the whole of the former current of three feet deep, will only raife the waters of this tiver one foot.

The fame rule ferves for thowing how high we ought to raife this weir in order to produce ang given rife of the waters, whecher for the purpofes of navigation, or for taking off at draft to drive mills, or fur any other Service; for if the breadih of the siver remain the fame, the water will fill flow over the weir with near'y the lame depth. A very fmall and hardly perceptible difference wiil indced arife from the diminution of flope occafioned by this rife, and a confequent diminution of the velocity with which the river approaches the weir. But this difference muft always be a fmall fration of the fecond term of our anfwer; which term is iffelf very finall: and even this will be compenfated, in fome defree, by the frecr fall which the water will have over the weir.

If the intended weir is not to have the whole breadth of the river (swhich is feldom necelfary even for the purpofes of navigation), the waters will be raifed higher, by the f.ume height of the watteboard. The calculation is precifely the fame for this cafe. Only in the fecond term, which gives the head of water correfponding to the velocity of the river, 1 mult ftill be taken for the whole breadth of the river, while in the firlt term \(l\) is the length of the walteboard. Alfo \(\sqrt{2 \mathrm{G}}\) mult be a little lefs, on account of the contractions at the ends of the weir, unlefs thefe be avoided by giving the mafonry at the ends of the watteboard a curved thape on the upper fide of the wafteboard. This fhould not be done when the fole object of the weir is to raife the furface of the waters. Its effect is but trifing at any rate, when the length of the waftebard is confiderable, in proportion to the thicknefs of the theet of water flowing over it

The following comparifons of this rule with experiment will give our readers fome notion of its utility.
\begin{tabular}{|c|c|c|c|c|}
\hline Difcharge of the Weir per Second. & Head producing the velocity at the Weir. & Head producing the Velocity above it. & Calcalated Height of the River. above the Wafteboard. & Obierved Height. \\

\hline
\end{tabular}

It was fonend extremely difficnlt to meafure the exar height of the water in the noper fream above the wafteboard. The curvature A I extended feveral feet up the ftream. Indeed there muft be fomething arbitrary in this meafurement, hecaufe the farface of the fream is not horizontal. The deviation thonld be taken, not from a horizontal planc, but from the inclined furface of the river.

It is plain that a river cannot be fitted for continued navigation by wenks. Thefe occafion interruptions; but a few inches may fometimes be added to the waters of a river by a bar, which may flill allow a flat-bottomed lighter or a raft to pafs over it. This is a very frequent pratice in Holland atd Flanders; and a very
cheap

Pratical cheap and certain conveyance of goods is there obtained Inferences by means of freams which we would think no better than boundary ditches, and unfit for every purpofe of this kind. By means of a bar the water is kept up a rery few inches, and the ftream has free courfe to the fea. The fhoot over the bar is prevented by means of another bar phaced a little way below it, lying flat in the bottom of the ditch, but which mas be raifed up on hinges. The lighterman makes his boat faft to a flake immediately above the bar, raifes the lower bar, lirings over his boat, again makes it faft, and, baving laid down the other bar again, proceeds on his journeyThis contrivance anfwers the end of a lock at a very trifing expence; and though it does not admit of what we are accuftomed to call navigation, it gives a very fure convegance, which would otherwife be impofible. When the waters can be raifed by bars, fo that they may be drawn off for machinery or other purpofes, they are preferable to weirs, becaufe they do not obftruct fluating with rafts, and are not deffroyed by the ice.

Prob. III. Given the height of a bar, the depth of water both above and below it, and the width of the river, to determine the difcharge?

This is by no means fo eafily folved as the difcharge over a weir, and we cannot do it with the fame degree of evidence. We imagine, however, that the following obfervations will not be very far from a true account of the matter.

We may firf fuppofe a refervoir LFBM (fig. 19.) of fagnant water, and that it has a wafteboard of the height CB. We may then determine, by the foregoing problems, the difcharge through the plane EC. With refpect to the difcharge through the past CA, it fhould be equal to this product of the part of the fection by the velocity correfponding to the fall EC, which is the difference of the leighis of water above and below the bar; for, becaufe the difference of \(\mathrm{E} a\) and C \(a\) is equal to E C, every particle \(a\) of water in the plane \(C A\) is prefled in the direction of this fream with the fame force, viz. the weight of the column E C. The fum of thefe difcharges thould be the whole difcharge over the bar ; but fince the bar is fet up acrofs a running river, its difcharge mun be the fame with that of the river. The water of the river, when it comes to the place of the bar, has acquired fome velocity by its flope or other caufes, and this correfponds to fome height F E. This velocity multiplied by the fection of the river, having the height \(\mathrm{E} B\), Thould give a difcharge equal to the difcharge over the bar.

To avoid this complication of conditions, we may firft compute the difcharge of the bar in the manner now puinted out, without the confideration of the previnus velocity of the ftream. This difcharge will be a litule too fmall. If we divide it by the fection F B, it will give a primary velocity too fmall, but not far from the truth. Therefore we fhall get the height F E, by means of which we fhall be able to determine a velocity intermediate between D G and CH, which would correfpond to a weir, as alfo the velocity CH , which correfponds to the part of the fection C A, which is wholly under water. Then we correct all thefe quan-
tities by repeating the operation with them inflead of Pracical our firf affumptions.
Mr Buat found this computation extremely near the truth, but in all cafes a little greater than obfervation exlibited.

We may now folve the prollem in the moft general terms.

Prob. IV. Given the breadth, depth, and the flope of a river, if we confine its paffinge by a bar or weir of a known height and width, to determine the rife of the waters above the bar.

The flope and dimenfions of the channel being given, our formula will give us the velocity and the quantity of water difcharged. Then, by the preceding problem, find the height of water above the wafteboard. From the fum of thefe two heights deduct the ordinary depth of the river. The remainder is the rife of the waters. For example :

Let there be a river whofe ordinary depth is 3 feet, and breath 40 , and whofe flope is \(1 \frac{1}{2}\) inches in \(100 \mathrm{f}_{4}\) -
 high and 18 feet mide.
We mult firft find the velocity and difcharge of the river in its natural ftate, we have \(l=480\) inches, \(b=\) \(36, \frac{t}{5}=\frac{r^{3}}{780 .}\). Our formula of uniform motion gives \(V=23,45\), and \(D=405216\) cubic inches.

The contraction obtains here on the three fides of the orifice. We may therefore take \(\sqrt{2 \mathrm{G}}=26,1\). N.B. This example is Mr Buat's, and all the meafures are Frencl. We have allio a (the height of the weir) 72 , and \(2 g=724\). Therefore the equation \(b=\)
 Add this to the height of the weir, and the depth of the river above the fluice is \(\mathrm{r} 2, \mathrm{r} 82,=8\) feet and 6,182 inches. From this take 3 feet, and there remains 5 feet and 6,182 inches for the rife of the waters.
There is, however, an important circumftance in this rife of the waters, which muft be diftinctly undertood before we can fay what are the interening effects of this weir. This fwell extends, as we all know, to a confiderable diftance up the ftream, but is lefs fenfible as we go away from the weir. What is the diffance to which the fwell extends, and what increafe does it produce in the depth at different diftances from the weir?

If we fuppofe that the flope and the breadth of the channel remain as before, it is plain, that as we come down the fream from that point where the fwell is infenfible, the depth of the channel increafes all the way to the dam. Therefore, as the fame quantity of water paffes through every lection of the river, the velocity muft diminifh in the fame propotion (very nearly) that the fection increafes. But this being an opeu Aream, and therefore the velocity being infeparably connected with the flope of the furface, it follows, that the flope of the furface mult diminith all the way from that point where the fwell of the water is infenfible to the dam. The furface, therefore, cannot be a fimple inclined plane, but muf be concave upwards, as reprefented in fig. 20. where FKLB reprefents the channel of a river, and FB the furface of the water running in it. If this be keft up to A by a weir AL, the furface \(P_{p}\)

Pragical will be a curve Fl d, touching the natural furface F Inferences. at the beginning of the fwell, and the line AD which rouches it in \(A\) will have the flope \(S\) correfponding to the velocity which the waters have immediately before going over the weir. We know this flope, becanfe we are fuppofed to know the difcharge of the river and its nope and other circumftances betore barring it with a dan ; and we know the height of the dam H , and therefore the new velocity at \(A\), or immediately above \(A\), and confequently the flope \(S\). Therefore, drawing the horizontal lines DC, AG, it is plain that CB and C.A will be the primary flope of the river, and the flope S correfponding to the velucity in the immediate neigh. bourhood of \(A\), becaule thefe verticals have the fame horizontal ditance DC . We have therefore \(\mathrm{CB}: \mathrm{CA}\) \(=\mathrm{S}: s\) very nealy, and \(\mathrm{S}-s: s=\mathrm{CB}-\mathrm{CA}: \mathrm{CA}\), \(=A B\) (nearly) : \(C A\). Thereforc \(C A=\frac{A B \times s}{S-s}=\)
\(\mathrm{H}_{s}\). But \(\mathrm{DA}=\mathrm{CA} \times \mathrm{S}\), by our definition of Rope ; therefore DA \(=\frac{\text { H.S. } s}{S-s}\).

This is all that we can fay with precifion of this curve. Mr l3uat cammined what would refult from fuppofing it an arch of a circle. In this cafe we fhould lave \(\mathrm{DA}=\mathrm{DF}\), and AF very nearly equal to 2 AD : and as we can thus find AD, we get the whole length FIA of the fiwell, and alfo the diftances of any part of the curve from the primitive furface FB of the river ; for thefe will be very nearly in the duplicate proportion of their diftanees from \(F\). Thus ID will be \(\frac{x}{7}\) of \(A B\), is. 'Iherefore we fhould obtain the depth I \(d\) of the Ilream in that place. Getting the depth of the fream, and knowing the difcharge, we get the velocity, and can compare this with the flope of the furface at I. 'Ihis flould be the flope of that part of the arch of the circle. Naking this comparifon, he found thefe circumplances to be incompatable. He found that the fection and fivell at I, correfponding to an arch of a circle, gave a difcharge nearly \(\frac{f}{5}\) th too great (they were as 405216 to 492142 ). Therefore the curve is fuch, that AD is greater than DF, and that it is more incurvated at \(F\) than at \(A\). He found, that making DA to DF as to to 9, and the curve FIA an arch of an ellipfe whofe longer axis was vertical, would give a very nice correfpor.dence of the fections, velucities, and tlopes. The whole extent of the fwell therefure can wever be double of AD, and mult always greatly furpafs AD ; and thefe limits will do very well for every practical queftion. Therefore making DF\% of AD, and drawing the chord AD , and making \(\mathrm{DI} \frac{1}{2}\) of \(\mathrm{D} i\), we thall be very near the truth. Then we get the fiwell with fufficient precifion for any point \(H\) between \(F\) and 1), by making FD\()^{2}: \mathrm{FH}^{2}=\mathrm{ID}: \mathrm{H}\); and if H is between 1 and \(A\), we get its diftance from the tangent Di by a fimilar procecs.

It only remains to determine the fwell produced in the waters of a rifer by the erection of a bridge or cleaning fluice whith contradts the paffage. This requires the folution of

Prob V. Given the depth, breadth, and hope of a river, to determine the fwell occalioned by the piers of a bridge of fides of a cleaning tluice, which contract
the paffage by a given quantity, for a given length of channel.
This fwell depends on two cireumfances.
1. The whole river muft pafs through a narrow fpace, with a velocity propertionably increafed; and this requires a certain head of water above the bridge.
2. The water, in paffing the length of the piers with a velocity greater than that corrcfponding to the primary flope of the river, will require a greater flope in order to acquire this velocity.

Let V be the velocity of the river before the erection of the bridge, and \(\mathbb{K}\) the quotient of the width of the river divided by the fum of the widths between the piers. If the length of the piers, or their dimenfion in the direction of the fream, is not very great, KV will nearly exprefs the velocity of the river under the arches; and if we fuppofe for a moment the contraction (in the fenfe hitherto ufed) to be nothing, the height producing this velocity will be \(\frac{\mathrm{K}^{2} \mathrm{~V}^{2}}{2 g}\). But the river will not rife fo high, having already a flope and velocity before getting under the arches, and the height correfponding to this velocits is \(\frac{V^{2}}{2 g}\); therefore the height for producing the augmentation of velocity is \(\frac{\mathrm{K}^{2} \mathrm{~V}^{2}}{2 g}\) \(-\frac{\mathrm{V}^{2}}{2 g^{*}}\). But if we make allowance for contrastion, we mutt employ a 2 G lefs than \(2 g\), and we muft multiply the height now found by \(\frac{2 g}{2 G}\). It will then become \(\left(\frac{\mathrm{K}^{2} \mathrm{~V}^{3}}{2 g}-\frac{\mathrm{V}^{2}}{2 g}\right) \frac{2 g}{2 \mathrm{G}},=\frac{\mathrm{V}^{2}}{2 \mathrm{G}}\left(\mathrm{K}^{2}-1\right)\). This is that part of the fwell which mull produce the augmentation of velocity.

With refpeet to what is neceflary for producing the additional flope between the piers, let \(p\) be the natural flope of the river (or rather the lifference of level in the length of the piers) before the erection of the bridge, and correfponding to the velocity \(\mathrm{V} ; \mathrm{K}^{2} p\) will very nearly exprefs the difference of fuperficial level for the length of the piers, which is necelfary for maintaining the velocity KV through the fame length. The increafe of flope therefore is \(\mathrm{K}^{2} p-p=p\left(\mathrm{~K}^{2}-1\right)\). Therefore the whole fwell will be \(\left(\frac{V^{2}}{2 \mathrm{G}}+p\right) \overline{\mathrm{K}^{2}-\mathrm{I}}\).

Thess are the chief queltions or problems on this Furthers atfubject which occur in the practice of an engineer; and tention to the folutions which we have given may in every cafe be the fibjece. depended on as very near the truth, and we are confi- recomdent that the errors will never amount to one-fifth of the whole quantity. We are equally certain, that of thofe who call themfelves engineers, and who, without hefitation, undertake j bs of enormous expence, not one in ten is able even to guefs at the refult of fuch operations, unlefs the circumfanecs of the cafe happen to coincide with thofe of fome other project which he has exccuted, or has difinatly examined; and very few have the fagacity and penetration necelfary for appreciating the effects of the dillinguifhing circumftances which yet remain. The fociety eftablifhect for the en-

Prasical couragement of arts and manufactures could fcarcely do Inferences: a more important fervice to the public in the line of \(\underbrace{}_{\text {their inftitution, that by publifhing in their Tranfac- }}\) tions a defription of every work of this kind executed in the kingdom, with an account of its performance. This would be a molt valuable collection of experiments and facts. The unlearned practitioner would find among them fomething which refembles in its chicf circumftances alnolt any project which could occur to him in his butinefs, and would tell him what to expect in the cafe under his management: and the intelligent engineer, affilted by mathematical knowledge and the habit of clafling things together, would frequently be able to frame general rules. To a gentlman qualified as was the Chevalier de Buat, fuch a collection would be ineftimable, and might fuggef a theory as far fuperior to bis as he has gone before all other writers.

We frall conclude this article with fome obfervations on the methods which may be taken for rendering fmall rivers and brooks fit for inland navigation, or at lealt for floatage. We get much inftruction on this fubject from what has been faid concerning the fwell produced in a river by weirs, bars, or any diminution of its former fextion. Our knowledge of the form which the furface of this fwell affects, will furnifh rules for fpacing thefe obftruations in fuch a manner, and at fuch diftances from each other, that the fwell produced by one fhall extend to the one above it.

If we know the flope, the breadth, and the depth of a river, in the droughts of fummer, and have determined on the height of the flood-gates, or keeps, which are to be fet up in its bed, it is evident that their ftations are not matters of arbitrary choice, if we would derive the greateft poffible advantage from them.

Some rivers in Flanders and Italy are made navigable in fome fort by fimple fluices, which, being fhut, form magazines of water, which, being difcharged by opening the gates, raifes the inferior reach enough to permit the paflage of the craft which are kept on it. After this momentary rife the keeps are fhut again, the water finks in the lower reach, and the lighters which were floated though the flallows are now obliged to draw intu thofe parts of the reach where they can lie afloat till the next fupply of water from above enables them to proceed. This is a very rude and imperfect method, and unjuftifiable at this day, when we know the effect of locks, or at leaft of double gates. We do not mean to enter on the confideration of thefe contrivances, and to give the methnds of their conftruction, in this place, but refer our readers to what has been already faid on this fubject in the articles Canal, Lock, Navigation (Inland), and to what will be fiaid in the article Warkr. Works. At prefent we confine ourfclves to the fingle point of hufbanding the different falls in the bed of the siver, in fuch a manner that there may be everywhere a fufficient depth of water: and, in what we have to deliver on the fubject, we fhall take the form of an example to illuftrate the application of the foregoing rules.

Suppofe then a river 40 feet wide and 3 feet deep in the droughts of fummer, with a 1 llope of 1 in 4800 . This, by the formula of uniform motion, will have a
velocity \(\mathrm{V}=23^{\text {? }}\) inches per fecond, and its difcharge Pracical will be \(40 j 216\) cubic inches, or \(23+\frac{2}{2}\) feet. It is pro. Interenee. pofed to give this river a depth not lefs than five feet in any place, by means of Hood-gates of fix feet high and 18 feet wide.

We firlt compute the beight at which this body of \(234^{\frac{1}{2}}\) cubic feet of water wili difcharge itrelf over the flood-gates. This we thall find by Prob. II. to be \(30 \frac{x}{\frac{1}{3}}\) inches, to which adding 72, the height of the gate, we have \(102 \frac{1}{4}\) for the whle height of the water above the floor of the gate; the primitive depth of the river being 3 feet, the rife un fwell 5 feet \(6 \frac{1}{7}\) inches. In the next place, we find the range or fenfible extent of this fwell by Prob. I. and the oblevations which accompany it. This will be found to be nearly 9177 fathoms. Now fince the primitive depth of the river is three feet there is only, wanted two feet of addition; and the quettion is reduced to the finding what point of the curved furface of the fwell is two feet above the tangent plane at the head of the fwell? or how far this point is from the gate? The whole extent being 9177 fathoms, and the deviation from the tangent plane being nearly in the duplicate ratio of the diftances from the point of contact, we may intitute this proportion \(66 \frac{1}{2}: 24=9177^{2}: 55^{2} 6^{2}\). The laft term is the diAlance (from the head of the fwell) of that part of the furface which is two feet above the primitive furface of the river. Therefore \(9177-5526\), or 365 r fathoms, is the diftance of this part from the flood-gate; and this is the diftance at which the gates flould be placed from each other. No inconvenience would arife from having them nearer, if the banks be high enough to contain the waters; but if they are farther diftant, the required depth of water cannot be had without increafing the height of the gates; but if reafons of conveniency thould induce us to place them nearer, the fame depth may be fecured by lower gates, and no additional height will be required for the banks. This is generally a matter of moment, becaufe the raifing the water brings along with it the chance of flooding the adjoining fields. Knowing the place where the fwell.ceafes to be fenfible, we can keep the top of the intermediate flood-gate at the precife height of the curved furface of the fwell by means of the proportionality of the deviations from the tangent to the diftances from the point of contact.

But this rule will not do for a gate which is at a greater diftance from the one above it than the 365 I fathoms already mentioned. We know that a higher gate is required, producing a more extenfive fivell; and the one fwell does not coincide with the other, although they may both begin from the fame point A (fig. 2r.) Nor will the curves even be fimilar, unlefs the thicknels of the fheet of water flowing over the gate be increafed in the fame ratio. But this is not the cafe; becaute the produce of the river, and therefore the thicknefs of the fheet 01 water, is conftant.
But we may fuppofe them fimilar without erring more than two or three decimalsof an inch; and then we fhall have \(\mathrm{AF}: \mathrm{AL}=f \mathrm{~F}: \mathrm{DL}\); from which, if we take the thicknefs of the fheet of water already calculated for the other gates, there will remain the height of the gate BL

- Alcs,

Dy fühowing the.e methods, infend of proceeding by random guelles, we thall procure the greateft depth of water at the imalle lt erpence poltible.

But there is a circumbance which muft be attended to, and which, ii neglected, may in a thort time render a!l our works ufeleis. Thefe gates mant frequently be open in the time of frefres; and as this channel then has its natural tlope increafed in every rach by the great contration of the feation in the gates, and allo rulls along i greater hody or water, the action of the Hream on ies bed naut be increafed by the augmentation of velocity which thele circumftances will produce: and ahthong we may ber that the genemal tlope is neccilmely fecural by the cills of the flood-gates, which are paved with flowe or covered with planks, yet this will not hinder this increafed current from digging up the botem in the intervals, undermining the banks, and lodeing the mud and earth thas carried of in phaces wilere the current meets with any check. All thefe confequences will alfuredly fillow it the increafed velocity is greater than what correponds to the regimen ralative to the foil in which the river holds on its courfe.

cal crin. In erder therefore to procure durability to works of tumes,

Let its brcadth at the bottom be 18 fect, and the bafe Pragical of its flanting fides \(\frac{4}{3}\) of their height. All of thefe di. Inference. menfions are very conformable to the ordinary courfe of things. It is propofed to make this river navigable in all taanons by neans of keeps and gates placed at proper diflances: and we want to know the dimenfions of a chamel which will be permanent, in a foll which begins to yield to a velocity of 80 inches per fecond, but will be fafe under a velocity of 24 .

The primitive chamel having the propertics of a rectangular channcl, its breadth during the frefhes mull be \(B=30\) fect, or 360 inches, and its depihb 9 fect or 105 inches; therefore its hydraulic me.m depth \(d=\frac{\mathrm{B} b}{\mathrm{~B}+2 \mathrm{~L}}=6 \mathrm{t}, 88\) inchics. Its real velocity thereforc, during the frethes, will be 58,9447 inches, and its difharge 151416 g cubic inches, or \(876 \frac{1}{4}\) cubic fect per fecond. We fee therefore that the natural channcl will not be permanent, and will be very quickly deltroycd or changca by this great velocity. Wc have two methods for pracuring Atability, viz. diminithing the flope, or widening the bed. The firft method will require the courfe to be lengthened in the proportion of \(24^{2}\) to \(39^{8 S^{2}}\), or nearly of 36 th 1 co . The expence of this would be enormous. The fecond method will require the hydraulic moan dopth to be increaled nearly in the lame proportion (becaufe the velocities are nearly as \(\frac{\sqrt{d}}{\sqrt{ }}=\). This will evidently be much lefs cottly , and, even to procure convenient room for the navigation, mult be preferred.

We muft now ohferve, that the great velocity, of which we are afraid, obtains only during the winter floods. It therefore we reduce thas to \(2+\) inches, it muft happen that the autumnal frefhes, loaded with fand and mud, will certainly depofit a part of it, and choak up our channel below the flood-gates. We mult therefore felect a mean velocity fomewhat exceeding the regimen, that it may carry off thefe depofitions. We thall take 27 inches, which will produce this effect on the loofe mud without endangering our channel in any remarkable degree.

Therefore we have, by the theorem for uniform motion, \(V=2 \pi=\frac{297(\sqrt{d}-0,1)}{\sqrt{s-L} \sqrt{s}+1,6}-0,3(\sqrt{s-0,1})\). Calculating the divifor of this formula, we find it \(=55,88+\) Hence \(\sqrt{d}-0, t=\frac{27 \text { incl. }}{\frac{297}{55,88+}-0,3}=\)
\(5,3^{8}+3\), and therefore \(d=30 \frac{\mathrm{r}}{\frac{\mathrm{r}}{2}}\). Having thus determined the hydranlic mean depth, we find the area \(S\) of the fection by dividing the difcharge 1514169 by the velocity 27. This gives us 56080,368 . Then we get the breadth \(B\) by the formula formerly given, \(\left.B=\sqrt{\left(\frac{S}{2 d}\right)^{2}-2 S} \right\rvert\,+\frac{S}{2 d}=1802,296\) inches, or 150,19 feet, and the depth \(b=3 \mathrm{r}, 115\) inches.

With thefe dimenfions of the fcction we are certain that the chamel will be permanent; and the cills o: the flood gates being all fixed agreeable to the primitive

\section*{Part II.}

R I V E R

Prasical flope, we need not fear that it will be changed in the inferencef. intervals by the adion of the carrent. The gates being all open during the frethes, the botton? will be cleared of all depofited mud.

We ruft now fation the flood-gates alng the rew channe!, at fuch difances that we may have the depth of water whic: is proper for the lighers that are to be employed in the navigation. Suppofe this to be four feet. We mult frit of all learn how high the water will be kept in this new channel during the fummer droughts. There remained in the prinitive channcl only 2 fee!, and the fect:on in this cafe had 20 feet 8 inches mean widh ; and the difcharge correfponding to this fuction and flope of \(\frac{18}{5 \sigma \sigma}\) is, by the theorem of uniform motion, 130,849 cubic inches per fecond. To find the depth of water in the rew channel correfponding to thi, difcharge, and the fame fepe, we mun take the meth of approximation formerly evemplified, remembering that the difiharge 1 ) is 130849 , and the breadth B is 1760,8 at the botenn (the flant fides being \(\frac{4}{3}\) ). Thefe data will produce a depth of water \(=6 \frac{1}{3}\) inches. To obtain four feet therefore behind any of the flond-gates, we mult have a fwell of \(41 \frac{2}{3}\) inches produced by the gate below.

W'e muft now detcrnine the with of paffage which mult be given at the gates. This will regulate the thickneis of the fheet of water which flows over them whenl fhut; and this, with the height of the gate, fixes the fwell at the gate. The extent of this iwell, and the elevation of every point of its curved furface above the new furface of the river, requires a combination of the height of fwell at the flood-gate, with the primitire flype and the new velocity. Thefe being computed, the ftations of the gates may be affigned, which will fecure four feet of water behind each in fummer. We need not give there computations, having already exemplified them all with relation to another river.

This example not only illuflrates the method of proceeding, fo as to be enfured of fuccefs, but alfo gives us a precife inflance of what mult be done in a cafe which cannot but frequently occur. We fee what a prodigious ex avation is neceffary, in order to cbtain permanency. We have been obliged to enlarge the frimitive bed to about thrice its former fize, fo that the excavation is at leaft two-thitds of what the other method required. The expence, however, will aill be valtly inferior to the cther, both from the nature of the work and the quancity of ground occupied. At all events, the expence is enormous, and what could never be repaid by the navigation, except in a very ich and populous country.

There is another circumit.ance to be attended to.The navigation of tbis river by fluices mult be very defultory, unlefs they are extremely numerous, and of fmal heights. The natural furface of the fwell being enncave upwards, the additions made by its difierent parts to the primitive beight of the river decre.lfe rapidly as they aiproach to the place A (fig. 20), where the fwell terminates; and three gates, cach of which raifes the water one foot when placed at the proper difance from each other, will raife the water much more than two gates at twice this difance, cach raifing the water two lett. Moreove;, when the eleva:
tion produced by a flood-gate is confiderable, exceeding Prasical a very fow inches, the fall and current produced by the inferences. opening of the gate is fuch, that no boat can polfibly pais up the river, and it runs imminent rifk of being overfet and funk, in the attempt to go down the theam. This renders the navigation defultery. A number of lighters collect themfelves at the gates, and wait then opening. They pafs through as foon as the current becomes moderate. This would not, peshaps be rery lurtful in a regulated navigation, if they could then proceed on their voyage. But the hoats bound up the river munt fay on the upper fide of the gate which they have jut now palfed, becaufe the channel is now too fiallow for them to proceed. Thoie bound down the river can only gn to the nexi gate, unlefs it has been opened at a time nicely adjufted to the opening of the one above it. The paflage downwards may, in many cafes, be continued, by very intelligent and attentive lockmen, but the pafage up muft be exceedingly tedious. Nay, we may fity, that ewlibit the paitare downards is continuous, it is but in a very few cafes that the paffage upwards is practicable. If we add to thefe inconveniencies the great danger of paflage during the frefhes, while all the gates are open, and the immenfe ard unavoidable accumulations of ice, on nccalion even of flight frofts, we may fee that this method of procuring an iniand navigation is amazingly expenfive, defultory, tedious, and hazardous. It did not therefore merit, on its own account, the attention we have beftowed on it. But the difcuffion was abfulutely neceffary, in order to fhow what mult be done in order to obtain effect and permanency, and thus to prevent us from engaging in a project which, to a perion not duly and coufidently informed, is fo feafible and promifing. Many profeflional engineers are ready, and with honef intentions, to undertake fuch tafks; and by avoiding this immenfe expence, and contenting themfelves with a much narrower channel, they fucceed, (witnefs the old navigation of the river Merfey). But the work has no duration; and, not having been found very ferviceable, its ceffation is not matter of much regret. The work is not much froken of during its continuance. It is foon forgotten, as well as its failure, and engineers are found realy to engage for fuch another.

It was not a very refined thought to change this impertcet mode for another free from mott of its incon-tion of veniencies. A boat was brought up the river, through locke. one of thefe gater, only by raifing the waters of the inferior reach, and depreffing thofe of the upper: and it could not eicape obfervation, that when the gates were far afunder, a vall body of water muft be difclarged before this could be done, and that it would be a great improvement to double each gate, with a very fmall dittance between. Thus a very fmall quastity of water would fill the interyal to the defired height, and allow the boat in come through; and this thought was the more obvious, from a linilar prastice having preceded it, r iz. that of navigating a fmall river by means of double bars, the loweft of which lay flut in the bnttom of the river, but could be raifed up on hinges. We have mentioned this already ; and it appears to have been an old practice, boing mentioned by Stevinus in tis valuable worls

Iraskeal on fluices, publiked about the heginning of the laft lulerences. century; jet no trace of this method is to be found of much older dates. It accurred, however, accidentally, pretty often in the Hat countries of lolland and Flander., which beng the feat of irequent wars, a'molt every town and village was fortified with wet ditches, comented whth the adjoining ivers. Stevinus mentions particularly the works of Condé, as having been long employed, with great ingenuity, for rendering navig to ble a very long ifretch of the Scheldt. The buats were reccived into the tower patt of the foffee, which was feparated fiom the relt by a tone batardeau, ferving to heep up the waters in the rell of the foffec about eigh feet. In this was a fluice and another dam, by which the boats could be taken into the upper foffee, whith communicated with a remote part of the Scheldt by a long canal. This appears to be one of the carlieft locks.

In the firf attempt to introduce this improvement in the navigation of tivers alreally kept up by weirs, which gave a partial and interrupted navigation, it was ufnal to avoid the great expence of the fecond dam and gate, by making the lock altogether detached from the river, within land, and having its bafon parallel to the river, and communicating by one end with the river above the weir, and by the other end with the river below the weir, and having a floodgate at each end.This was a moft ingenious thought ; and it was a prodigious improvement, free from all the inenareniences of currents, ice, \&cc. \&ce. It was called a Schlufle or lock, with confiderable propriety; and this was the origin of the word fulice, and of our application of its tranfation lock. This prastice being once introduced, it was not long before engineers found that a complete feparation of the navigation from the bed of the river was not only the moft perfect method for obtaining a fure, cafy, and uninterrupted navigation, but that it was in general the mon wconomical in its firf contrucrion, and fubject to no rilk of deterioration by the action of the current, which was here entitely removed. Locked canals, therefore, have almoft entirely fupplanted all attempts to improve the natural beds of rivers; and this is hardly ever attempted except in the flat countries, where they can hardly be f.id to differ from horizontal canals. We therefore clofe with thefe obfervations this article, and referve what is yet to be faid on the confrustoin of canals and locks for the article IW.iter. I'orks.

116 We beg leave, however, to detain the reader for Concluding a few moments. He cannot but have obferved our oblervations to the readcr. anxicty to render this differtation worthy of his notice, by making it practically ufeful. We have on every occafion appealed, from all theoretical deductions, hewever Specions and welt fupported, to fat and cobfervati m of thofe fpontaneous phemmena of natu'e whicl are continually falfing in review before us in the motion of ruuning waters. Refling in this manner our whole doctrines on experiment, on the obfervation of y hat teally happens, and what happens in a way which we cunot or do not fully explain, thefe fpoutaneous operations of nature came infentibly to acquirc a preticular value in cur imagination. It has alio harpsence' is the courfe of our reflections on thefe fub-
jeets, that thefe phenomena have frequently prefented themelves to our view in groups, not lefs remarkable for the extent and the importance of their condequences than ior the dimplicity, and freguently the feemeng in. figuificancy, bay frivolity, of the means employed. Our fancy has therefore been fometinics warmed with the view of a fomething; an

Suss agitazs molem, at magn fo corpore mijechs.
This has fometimes made us exprefs ourfolves in : way that is fuiceptible of miinterpretation, and may even lead into a miftal.e of our meaning.
We therefore find ourfelves obliged to declare, that by the term nature, which we have fo frequently ufed con amore, we do not mean that indefcribable idel which the felf-conecit and vanity of certain would-be philofophers have fet up of late, and oftentationly lland on tiptoe to worfhip. This ens rationis, this creature of the im.rgination, has long been the object of cool contemplation in the clofet of the philofopher, and has thared his attention with many other play-things of his cver-working fancy. But the more the werks of NAture are inveftigated by thofe who alone deferve the nime of true philofophers, the more evidently will they be difcovered to be not the clance fragments of a fatal chaos, but the beautiful produtions of a wonderful Artift, and the darling objeats of his care: and we perfuade ourfelves that many thoufands are ready to rally under the banners of true religion and found philolophy, and to follow the feps of a Clarkc, a Butler, a Newton, and a Boyle, who fo eminentIy diltinguithed themfetves in the caufe of Niture's God.

By xature, then we mean that admirable fytem of general laws, by which the adored Author and Governor of the univerfe has thought fit to connest the varions parts of this wonderful and groodly frame of things, and to regulate all their operations.

We are not afraid of continually appealing to the laws of nature; and as we have already obfersed in the article Philosophy, we confider thefe general laws as the mof magnificent difplays of Infinite Wifdom, and the contemplation of them as the moll cheering employment of our under tandings.

\section*{Igneus effillis vigor at calefis origo Seminibus.}

At the fame time we defpife the "cold-hearted philoropher who ftops thort here and is fatisfied (perhaps inwardly pleafed) that he has completely accounted for every thing by the laws of unchanging nature; and we fufpect that this philofopher would analyie with the fame frigid ingenuity, and explain by is refiftible sof \(2 \cdots\), the tender attachmeat of her whofe breat he fucked, and who by many ansiots and fleeplefs nights preferved alive the puling infant. But let us rather liflen to the words of him who was the moft fagacious obferver and the mof faithful interpreter of nature's laws, the illuftrious Sir lfaac Newton. He fays,
" Elegrantillima haxce rerum compages non nifi,confilio et dominio entis fapientiflimi et potentiflimi oriri potuit. Omnia, fimili conflructa confilio, fuberunt unius dominio. Hic omnia regit, non ut anima munti, fed ut univerforum dominus. Propter dominium fuum dominus deus,

Friji touchunt fa Theoric des Ficuves; Tabieau dis prinipales Rivierss du Monto, par Genetté; Stevins fur les Ecluyes, Trailédes Eccufes; par Boulard, qui a remporté le Prix del'Acud. de Lyons; Bleilwyck Defertatio de Aggeribus; Boffut et Viallet fur lu Confruction des Digues; Stevin Hydrofatica; Tielman van der Horf Theatrun: Machinarum Univerfale; De la Lande fur les Canaux de Naviçation; Racolta di Autori chi Trat!aino del Moto dell' Aque, 3 tom. 4 to, Firenza 1723. -This mofl valuable collection contains the writings of Archimedes, Albizi, Galileo, Caftelli, Michelini, Borelli, Montanari, Viviani, Cafini, Guglielmini, Grandi, Manfredi, Picard, and Narduci ; and an account of the numberlefs works whick liave been carried on in the embankment of the Po.

\section*{凡 O A}

Rures-lifuter. This is generally much fofter and better accommodated to economical purpofes than fprang-water. For though rivers proceed originally dom fpinge, yet, by their rpid motion, and by being expofed during a long courle to the influence of the tun and air, the earthy and metallic falts which they contain are decompoid, the acid lies off, and the terreftial parts precipitate to the bottom. Rivers are alfo rendered fofter by the vaft quemtity of rain-water, which, paling aleng the furfice of the earth, is conveyed inta their channels. Dut all rivers carry with them a great deal of mud and other impurities; and, when they How mear large and populous towns, they become impregnated wihla number of heterogeneous fubfances, in which flate the water is cotainly unfit for the purpofes of life; yet, hy remaining for fome time at reft, all the feculencies fubfide, and the watc: becomes futiciently pure and potable.

RIVERS (Earl). See Wodevile.
RIVINIA, in botany: A genus of the monogynia order, belonging to the tetrandria clafs of plants. - The perianth is fort-leaved, coloured, and permanent, the leaflet oblong-egged and obtufe; there is no corolla, un. lefs the calyx be confidered as fuch. There are four or cight filaments, fhorter than the calyx, approaching by pairs, permanent ; the anthers are fmall. The germ is large and roundilis; the ftyle very thort; the lligma fimple and obture. The berry is globular, fitting on the green reflected calyx, one-celled with an incurved point. There is one feed, lensform and rugged. This plant is called Solonoriles by Tournefort, and Picreca by Wriller. It grows naturally in moft of the inlands of the Weft Indies. The juice of the berries of the plant will ftain paper and linen of a bright sed colour, and many expeliments made with it to colour flowers have fucceeded extremely well in the following manner: the juice of the berries was preffed ont, and mixed with common water, putting it into a phial, flaking it well together for fome time, till the wate: was thoroughly tinged; then the flowers, which were white and jult fully blown, were cut off, and their ftalks placed into the phial ; and in one night the flowers have been finely variegated with red; the flowers on which the experiments were made were the tubcrofe, and the double white narcillins.

RIVUIET, a diminutive of tiver. See River.
ROACH, in ichthyology. See Crprinus.
ROAD, an open way, or public paffage, forming a communication between one place and another.

Of all the people in the world the Romans took the molt pains in forming roads; and the labour and expences they were at in rendering them fpacious, firm, itraight, and finooth, are incredible. 'They ufially Atrengthened the ground by ramming it, laying it with Hints, peblles, or fands, and fometimes with a lining of mato:ry, wiblith, bricks, \&c. bound together with moriar. In fome plices in the Linnuis, \(F\) Meneftrier obtaree, that he lais finnd huge chufters of fints cemen:ed with iims rearhing 10 or 12 feet deep, and moking a mals, \(\therefore\), hard and compait as marble; and Which, after tefoting the injuies of time for 1600 years, is fitil fea:ce yer atrable by all the force of hammers, mathoiss, \&ic. and yet the fints it confills of are nut bigger than e: gs. The mof noble of the Roman robde wactinc Via \(\AA_{i} p^{\circ}\), which was carried to fuch a
vat length, that Procopins reckons it five days journey to the end of it, ind Leiptins computes it at 350 miles: it is 12 feet broad, and made of fquare free-llone generally a font and a half on eacls fide ; and though this bas latted for above a Soo years, yet in many places it is lor leveral miles together as entire as when it wats fitt made.

Thic ancient roads are dittinguifhed into military roads, double roads, fubterraneous roads, \&ec. The military reads where grand roads, formed by the ko. mans for marcling their anmies into the provinces of the empire; the principal of the fe Roman roads in England are Wating-flrcet, Ikenild-itreet, Fors way, and Erminage-ftreet. Double roads among the Rumans, were roads for carriages, with two parments, the one for thofe going one way, and the other for thofe returning the other : thefe were feparated from each other by a caufeway raifed in the middle, paved with bricks, for the conveniency of foot palfengers; with borders and mounting fones from face to fpace, and military columns to mark the dift.ince. Subterraneous roads are thofe dug through a rock, and lelt vaulted ; as that of Puzzuoli near N.ples, which is near half a league long, and is 15 feet broad and as many ligh.

The firt law enacted refpecting lighways and roads in England was in the year 1285; when the lords of the forl were enjoined to enlarge thofe auys where buihes, woods, or ditches be, in order to prevent robberics. The next law was made by Edward I11. ia the year \(134^{6}\); when a commifition was gramted by the hing to lay a toll on all forts of carriagre paning from the hofpital of St Giles in the fieds to the bar of the Old Temple, and alfo through another highway called PortFoo! (now Gray's Inn Lane) joined to the before-ramed highway ; which roads were become almof impaffable. Little further relating to this fubject occurs, till the reign of Henry V11I. when the parifhes were entruft. ed with the care of the roads, and furveyors were annually elected to take care of them. But the increafe of luxury and commerce introduced fuch a number of heavy carriages for the conveyance of goods, and lighter ones for the convenience and eafe of travelling, that parifh aid was found infufficient to keep the bett frequented roads in repair. This introduced toll-gates or turnpikes; that fomething might be paid towards their fupport by every individual who enjoyed the bencfit of thefe improvements, by pafing over the roads.

Speaking of roads, the Abbé Raynal juftly remarks. " Let us travel over all the countries of the earth, and wherever we fhall find no facility of trading from a city to a town, and from a village to a hamlet, we may pronounce the people to be barbarians; and we flall only be deceived refpecting the degree of barbarifm."

Road, in navigulion, a bats, or place of anchnrage, at fome diftance from the thore, whither thips or veffels occationally repair to receive intelligence, orders, or neceflary fupplies; or to wait for a fair wind, \&c. The excellence of a road confifts chicfly in its being proteited from the reigning winds and the fivell of the fea; in having a good anchoringground, and being at a compecent diftance from the thore. Thofe which are not fulliciently inclofed are termed open roails.

ROA.J, in the manege: A roan horfe is one of a

\section*{R OB}

Roanozk bay, forrel, or black colour, with grey or white fpots interfperfed very thick. When this party-coloured coat is accompanied with a black head atid black extuemities, he is called a roan horfe with a black-a-moor's bead: and if the fame mixture is predominant upon a deep forrel, he is called claret-roan.

ROANOAK, an inand of North America, near the coalt of North Carolina. Here the Englifh firft attempted to fettle in 1585 , but were obliged to leave it for want of provifions. E. Long. 75.0. N. Lat. 35. \(4^{0}\).

Roanoak, a river of North America, which rifes in Virginia, runs through Carolina, and at length falls into the fea, where it forms a long narrow bay called Albemarle found.

ROASTING, in metallurgic operations, fignifies the diffipation of the volatile parts of an ore by heat. See Metallurgy, pafim.

ROB, in pharmacy, the juices of fruits purified and infpiffated till they are of the confifence of honey.

ROBBERY, the raping of the civilians, is the feloninus and forcible taking, from the perfon of another, of goods or money \(t 0\) ans value, by violence or putting him in fear. 1. There muft be a taking, otherwife it is no robbery. A mere attempt to rob was indeed held to be felony fo late as Henry IVth's time; buit afterwards it was taken to be only a mirdemeanour, and punifhable with fine and imprifonment; till the fatute 7 Gen. II. c. 21 . which makes it a felony (tranfportable for feven years) unlawfully and maliciouny to affault another, with any offenfive weapon or inftrument;-or by menaces, or by other forcible or violent manner, to demand any money or goods; with a felonious intent to rob. If the thief, having once taken a purfe, returns it, fill it is a robbery : and ro it is whether the taking be Atrially from the perfon of another, or in his prefence only; as where a robber by menaces and violence puts a man in fear, and drives away his heep or his cattle before his face. 2. It is immaterial of what value the thing taken is: a penny, as well as a pound thus forcibly extorted, makes a robbery. 3. Lafly, the taking mult be by force, or a previous putting in fear; which makes the violation of the perfon more atrocious than privately ftealing. For, according to the maxim of the civil law, "qui vi raruit, fur improbior cfle videtur." This previous violence, or putting in fear, is the criterion that dininguifhes robbery from other larcenies. For if one privately fteals fixpence from the perfon of another, and afterwards keeps it by putting him in fear, this is no robbery, for the fear is fubfequent; neither is it capital as privately fealing, being under the value of twelvepence. Not that it is indeed necelfary, thoug! ufual, to lay in the indifment that the robbery was committed by putting in fiar: it is fufficient, if laid to be done by violence. And when it is laid to be done by putting in fear, this does not imply any great degree of terror or affright in the party robbed: it is enough that fo inuch force or threatening, by word or gefture, be ufed, as might create an apprehenfion of danger, or induce a man to part with his property without or againft his confent. Thus, if a man be knocked down without previous warning, and Aripped of his property while fienfelefs, though frielly lee cannot be frid to be fut in foar, yet this is undoubtedly a robbery. Or, if a pcrVor. XVI.
fon with a fivord drawn begs an alms, and 1 give it him through miftruft and apprehenfion of violence, this is a felonious robbery. So if, under a pretence of fale, a man forcibly extorts money from another, neither flall this fubserfuge avail him. But it is doubted, whether the forcing a higler, or other chapman, to fell his wates, and giving him the full value of them, amounts (1) fo heinous a crime as robbery.

This fpecies of Larceny is debarred of the benefit of clergy by tatute 23 Hen. VIII. c. I. and other fublequent fatutes; not indeed in general, but only when committed in a dwelling.houfe, or in or near the king's highway. A robbery therefore in a diftant field, or footpath, was not punifhed with death; but was open to the benefit of clergy, till the flatute 3 \& 4 W. and M. c. 9. which takes away clergy from both principals and acceffories before the fact, in robbery, wherefoever committed. See Law, No clxrxvi. 30.

ROBERT bruce, king of Scotland, in 1306; a renowned general, and the deliverer of his country frons a fate of vaffalage to the Englifh. See Scotland.

Robert, king of France, furnamed the Wife and the Pious, came to the crown in 996 , after the death of Hugh Capet his father. He was crowned at Orleans, the place of his nativity, and afterwards at Rheims, after the imprifonment of Charles of Lorraine. He married Bertha his coufin, daughter of Conrad king of Burgundy ; but the marriage was declared null by Gregory V.; and the king, if we can give credit to cardinal Peter Damien, was excommunicated. This anathema made fuch a noifc in France, that all the king's courtefans, and even his very domeftics, went away from him. Only two continued with him; who were fo deeply impreffed with a fenfe of horror at whatever the king touched, that they purified it with fire: this fcruple they carried fo far, as to the very plates on which he was ferved with his meat, and the veffels out of which he drank. The fame cardinal reports, that as a punifhment for this pretended inceft, the queen was delivered of a monfter, which had the head and neck of a duck. He adds, that Robert was fo ftruck with aftonifhment at this fpecies of prodigy, that he lived apart from the queen. He contracted a fecond marriage with ConAance, daughter of William count of Arles and Provence; but the arrogant difpofition of this princefs would have totally overturned the kingdom, and thrown it into confufion, had net the wifdem of the ling prevented her from intermeddling with the affairs of the ftate. He carefully concealed from her whatever acts of liberality he fhowed to any of his domentics. "Take care (faid he to them) that the queen don't perceive it."-Henry duke of Burgundy, brather of Hugh Capet, dying in 1002, without lawful ifue, left his cukedom to his rephew the king of France. Robert invefted his fecond fon Henry with this dukedom, who afterwards coming to the crown, refigned it in favour of Rebert his cadet. This duke Robert was chief of the firft royal brancl of the dukcs of Burgundy, who fourilhed till 1361 . This dakedom was then re-united to the crown by king John, who gave it to his fourth fon Philip the Bold, clief of the fecond houfe of Burgundy, which was terminated in the perfon of Charles the Ralh, who was hlain in \(1+7 \%\). King Robert wals fo much eftemed for his wifdom and pridence, that
Q. 1

 ! anexer, l.e el.cined to :l cept. Hushn, callet the Ciont,

 beri was, according to the frowledge it the inn:s, a wit price. I-l.g ubt, friat of Plury, relates, in his lice of lim, that, to lrevent his fuljeats from fulliginto the crime of perjury, and incurring the penalties which followet thereor, he male them lwear upen a thrine from which the rilics had been previontly romowed, as it intention did not conditute perjury! and lons : tite dimilar reatonisy was adoptec. Robert built at arat number af churches, and procured at relitution (1) the ciergy ef the tithes and wealh which the lay1 rashad made themitues malters of. The depredations were fich, that the daty pollelifed the eccelatio cal trealeres by hereditary tites; they divid.d then amons tlisir childan; they even grave benefices as a dundy with their datherers, or lett them to their fons as lawinl inheritance. Although Robert wis pious, arod alti:cugh he refpected the clergy, jet it was evicent that he oppofit the bilhops with a firmnels and refulution if which, for many ages, they had had no ex:mpics. Lutheric atchbilhep of Sens had introduced i. io his diocule the cullom of proving by the eucharith periens accuted as gnilty of any crime. The hing prote to him in the following ltrong terms: "I fwear (hays lie) by the futh I owe to God, that if yon do not put a top to the grois abule complained of you 1hall be deprived of your pricthood." 'Ihe prelate was torced to comply. He funilled in 1022 , the Mani. cherns, canons of Osleans, by burning them at the thate. Thacre are, liowerer, iecorded of him fome lets fevereations, which it is right to mention. A danfrerous confiracy againf his perfon and government hinving been difovercd, and the authors taken into cuftody, he feized the moment when their judges had meet to fontence them to death, to caufe an elegrant repalt to be ferved up to them. Next day they were admitted to the eucharit. Then Robert told them, that he gave them their prardon, "becaule none of th fe can die whom Jefus Chrif came to receive at his table." One day when he was at prayers in the c!apel, he perceived a thief, who had cut off the half of the fringe of his mantle, proceeding to take the remander; "Friend (fays he with a pleafant countenance), be content with what you have already taken, the relt vill very well ierve fome other." Robert cul. Livited, and was a patronizer of the fciences. These are liveral hymns wote by him, which lilll continue to be fung in the church. His reign was happy and tranquil. Accordiag to fome authors, he inftituted the order of the Star, commonly attributed to king John.

Rubert of liance, lecond fon of Louis TIII. and brother to st Lonis, whoerefed in his favour drtois in:o a royal peerage in the year 1237 . It was curing this time that the unlucky differenee between pope Grerury 1 X. and the cmperor Fredetic 1I. tonk place. Grefory offered to St 1 .onis the empire for Robert ; but ib: French noldelle, having met to deliberate on this fropofa', were of opinion that he ounht to reject jr. He gave the pone for anfwer: "That Count Rotert eftecmed limfell iufficiently hnoured by being the brother of it bing, who firpalfed in diernity, in
fleartin, in vealah, and in binth, at! other menurcis in the world." Robert accompariad Sis Ienuis iato Eg.pt, and fongle with mote brairsy thin prudence at the buthe of wall ure, on the ghl of irborny 1250 . In lis purfint of the cowards throngh a centain limall village, de was killed by ttones, thik's, and cther things which ehey thres at hian from the windows. He was an intrepis priaci, but too pationate, dogmatical, and quarcelf mas.

Kobert II. Cioun of Aricis, fon of the preceding, furnamed the Good and the Noule, wats at the expedition into 3 fricat in 12,0. He drove the sebels from Nowarre in 1276 . Ile brought a very powerful allitance to Charles I. king of Naples, of which kingdom he was regent daring tice captivity of Charles II. He defeated the diragonians in Sicily in \(129, y\), the Eng. lith near Ihayonne in 1206 , and the Flemith at Furres in 1298 . But haviag in 1,302 improdently attempted to force the latt, when encamped niar Courtroy, he received no lets than 30 wounds; and in that expedition lott both his honour and his life. IIe was a brave, but pallionate and ficree man, and good at nothing but pu. gatilic encounters. Mahatud his datughter inherited the dukedom of Artois, and gave herlelf in marriage to Otho duke of Burgundy, by whom the hat two daughters, Jane wife of Philip the Long, and Blanche wife of Charles the Fair. In the mean time Philij, fon of Robert II. had a fon.

Roeerr III. who difputed the dukedom of Artois with Mah:tud his aunt; but he loft his fuit by two fentences given in againt hinn in 1302 and 1318 . He withed to revive the procels in 1329 , under Philip of Valois, by neans of pretended new titles, which were found to be falte. Rovert was condemned the third time, and banifhed the kingdom in 1335. Having found an afylurn with Edward III. king of England, he undertook to declare him king of Irrance; which proved the caule of thofe long and cruel sars which diltrelied that kingdom. Robert was wounded at the fiege of Vannes in 1342, and died of his wound in England. John, fon to Robert, and count of Eu, was taken prifoner att the battle of Poitiers in 1.356 , and terminated his career in \(1387^{\circ}\). His fon Philip II. high conftable of France, carried on war in Alrica and Hungary, and died in \({ }^{1} 397\), being a prifoner of the Turks. He had a fon named Cbarles, who died in 1472 , laving no iffue.

ROBERT of Aivjou, furnamed the Wife, third fon of Charles the Iame, fucceeded his father in the kingdom of Naples in 1309, by the protection of the popes, and the will of the people, to the exclufion of Charobert fun of his eldeft brother. He aided the Roman pontill's againft the emperor Henry VII, and, after the death of that prince, was nominated in 1313 vicar of the empire in Italy, in temporal matters, mices a new emperor was elected. This title was oiven him by Clement \(V\). in vistue of a right which he pretended to have to govern the empire luring an interregnum. Robert reigned with glory 33 years, eight months, aml dict 1 on the \(19^{t h}\) of January \(13+3\), aged 64 . "This prince (foys M. De Montigni) had not thote qualitics which corsllitute herocs, but he had thofe which make good kings. He was religious, affable, generous, kind, wics, prudent, and a zealous promoter oi juftice." He wals called the Solomon of his age. He loved the poor,

\section*{R O B}
and caured a ticket to be placed upon his palace, th give noticc when he meant to difribute from the throne. He had no other paffion but a very great love for learning. He ufed to fay, that he would rather renounce his crown than his fudy. His court foon hecame the fanctuary of the fciences, which he encouraged equally by his example and his bounty. This prince was verfed in theology, jurifprudence, philofophy, mathematics, and medicine. Bocace fays, "that fince the days of Solomion we hare not feen fo wife a prince upon the throne." For a great part of his life he had no tafte for poetry; he even defpifed it, as, in lis opinion, unwortly of a man of learning. A converfation which he liad with Petrarch, however, unde. ceived him ; he retaiued this poot at his court, and attempted himfelf to write fome poems, which are fitl extant. He was forced to engage a little in war, for which he pofiefied no great talents : alluding to which, may be feen en his tomb a wolf and a lamb drinking ont of the fanne velfel. Philip of Valois refrained frons giving battle in 1339 , by the repeated advice which this prince gave him, who was a great friend to France, both from inclination and interelt. He detefted quarrels among Chriftian princes, and had audied the fcience of aftrology, not fo much to know the courte of the flars, zs to learn by this climerical fcience the hidden things of futuricy. He believed that he read in the grand book of heaven a very great misfortune which would befal France if Philip hazarded a battle again \(\mathfrak{t}\) the Englifl.
Rosert the Firf, called the Magnificent, duke of Normandy, fecond fon of Richard 11. fucceeded in 1208 his brother Richard III, whom it is reported he poifoned. He had early in lis reign to fupprefs frequent rebellions of feveral of the great vaffals. He reeftablifhed in his eflates Baudouin IV. count of Flanders, who had been unjurtly ftript of his poffeffions by his own fon. He forced Canute king of Denmark, who was alfo king of England, to divide his poffeffions with his coutins Alfred and Edward. In the year 1235, he undertook barefooted a journey to the Holy Land; on his return from which he died, being poifoned at Nice in Bithynia, lcaving as his fucceffor Wil. liam lis natural fon, afterwards king of England, whom he had caufed before his departure to be publicly acl:nowledged in an Affembly of the fates of Normandy.
Robert, or Rusert, furnamed the Short and the Mild, elector Palatine, fon of Robert the Niggardly, was born i.1 1352, and elected Emperor of Germany in r 400 , after the depofition of the cruel Wencelas. In order to gain the affetions of the Germans, he wifl.ed to reffore Milanes to the cmpirc, which Wencellas had taken from it ; but his attenppts i:1 this refpect were unfuccefful. His attaclument to the anti-pope Grego. ry XII. estirely alienated the affections of the Gerrnan princes. To fuch a degrec were they incenfed againt him, that they entered into a confiniacy to cut hini off; but his death, which happencl on the \(18 t h\) of May \(1+10\), being then 53 years old, put a fop to their machinations. Robert bezan to feutle the fiovereignty of the German Princes. The emperors had formerly tetained in their own lands hise power of life and death, vithin the teritories of a crea: many of the nobles; hut he yielded thent this right by lis letters patent.The chicf fult impu:č to this pince was an excers of
lenity. But, if vee confider the plots which he had on Rutur, detect, the confiracies which lie had to firtrate, the fecret and powerful enemies he liad to deal with; if tre inquire alfo into the commntions which the wicked adminiftration of Wenceflas had excited, the irruptions and devaftat:ons of plunderers and lighway robbers, which the nebles countenanced, and the diftrefled lituation in which he found Germany, we mult wilhout hefitation conclude, that his lenity iadicated his prt:dence, in reftoring by flow degrees the empite to its original tranquillity. Robert had his virtues, he loved his fubjects, and governed them with wifilom. Poffeffied of much political knowledge for the age in which he lived, he wanted nothing but talents for war to make him an accomplifhed prince. He was twice married. The name and rank of his firlt wife is unknown; he had by her a fon who died before him. His fecond wife was Elizabeth, daughter of Frederic burgrave of Nuremberg, by whom he had five fons and three daughters. The three daughters were, Margaret married to Cliarles duke of Lorrain; Agnes to Adolphus duke of Cleves; Elizabeth to Frederic duke of Aulria. His fons were, Louis the firft of the eleetoral branch, which became extinot in 1559; John father of Chriftopher king of Denmark; lirederis who died without iffue ; Ctho count of Sintheim ; lafly, Steplen, from whon: defcended the elector, and the other counts palatine of the Rhine, who are extant at this day.
Rokert (of Bavaria), prince palatine of the Rhine, and duke of Cumberland, the fon of Frederic, elector palatine, by Elizabeth, daughter of James I. king of England, dittinguifhed himielf by his valour as a general and admiral; firft in the Dutch, and then in the Englifh fervice. He was unfuccelfful in the caufe of his uncle Charles I. againt the parliament forces; but under Charles II. he defeated the Dutch feet, and was made lord high admiral of England in 1673. This prince was a lover of the fciences, and particularly Ril. ful in chemiftry. He died in 1682 .
ROBERTSON (Dr William), one of the moft celebrated hiftorians of his age, was one of thofe great charafters whofe private life, flowing in an even and unvaried Itream, can afford no inpportant information to the biographer, although his writings will be read to the lateft pofierity with nndiminifhed pleafure. He was born at the manfe of Borthwick in the year 172 I . His father was, at the time of his death, one of the minitters of the Old Grey Friar's church in Edinburgh, which the Doctor came afterwards to fupply. In fity he was licenfed preaclier, and placed in the parihh o: Glads-muir in \(174+\); whence, in 1758 , he was trannated to Lady Yel.er's parifh in Edinburgh. In \(1 ; 6 \mathrm{i}\), on the death of principal Golitie, he was eleted principal of the U'niverfity of Exinburgh, and appointed one of the minilers of the Old Grey Friar's church. About this petiod he received the degree of Dosor of Divinity, and was appoir ted hiftoriographer to lis majelty for Sectland, and one of his \(m\) jelly's chaplains for that kingdom.
Whe find ic not caly to afceriain :.t what period were firt unfolded the great and fingular talants whicis) deAtined 1 ) Robertion to be one of the firt wriers that refued Britain from the reproach of rat having ang and hilorians. We are, firwever, afiured, that beiw: the fublication of any of lis liceray yerformances,
\(K_{\text {, h. rtion }}\) ever from his firlt appearaace in public life, his abulities -r 2... to his mor: intinate friends he difoovered marls of fuch high-mind:d ambition, as, feconded by thofe abilities, could not lave failed to carry hine to the tirft hotours of his profellion, in whatever iphere he had been plat ced, and whatever oppotition he might have had to combat.

The firf theate that offered for the diplay of his talents, was the General A ITemb? of the Church of Seotiand. It is the anmual meetings of this court that prodace to view men who would ocherwife remain in the deepelt obfeurity. There the humble paftor, whote lot has been calt in the remoteit corner of the Highland wilds, feels himelf, lor a time, on a footing of equality with the firlt citizen in the hingdom: he can there difpute with him the prize of eloquence, the molt flatering difinction to a liberal mind; a difinction which is naturally fought after with the greater eagernefs in that aflembly, as the fimple eftablimment of the church of Scotland has rendered it the only pre-cminence to which the greatelt part of its nembers can ever hope to attain.

From the moment Dr Robertion firt appeared in this alfembly, he became the objeft of univerfal attention and applaufe. His fpeeches were marked with the fame manly and perfuafive eloquence that diftin. guifhes his hillorical compofitions; and it was obferved by all, that while his young rivals in oratory contented themfelves with opening a caufe, or delivering a fudied harangue, be thowed equal ability to Atart objections, to anfwer, or to reply ; and that even his moft unpremeditated effufic ns were not unadorned with thofe harmonious and feemingly meafured periods, which have been fo much admired in his works of labour and rcfle:tion. He foon came to be confidered as the ablett lupporter of the caufe he chofe to efpoufe, and was now the unrivalled leader of one of the great parties which have long divided the church of which he was a inember.
